H.-J. Borchers

Translation Group and Particle Representations in Quantum Field Theory

(New Series m 40)

1996. VII, 131 pages.

Hardcover DM 54,-

ISBN 3-540-61140-1

A thorough and, indeed, the first systematic investigation of the interplay between the locality condition in configuration space and the spectrum condition in momentum space. The work is based on techniques from algebraic quantum theory and from complex analysis of several variables. Readers are first made familiar with a set of basic axioms heuristically explained from first principles of quantum physics and will find the results presented in a systematic way. The book addresses researchers as well as graduate students.

P. Bouwknegt, J. McCarthy, K. Pilch

The W_3 Algebra

Modules, Semi-infinite Cohomology and BV Algebras

(New Series m 42)

1996. IX, 204 pages.

Hardcover DM 62,-

ISBN 3-540-61528-8

Concentrating on the algebra of physical operators determined from an analysis of the corresponding BRST cohomology, this book develops the representation theory of W algebras needed to extend the standard techniques which were so successful in treating linear algebras. For certain strings corresponding to WN gravity it is shown that the operator cohomology has a natural geometric model, suggesting new directions for the study of W geometry.

E. Elizalde

Ten Physical Applications of Spectral Zeta Functions

(New Series m 35)

1996. XII, 224 pages.

Hardcover DM 62,-

ISBN 3-540-60230-5

Here, everything is explained in detail, in particular the mathematical difficulties and tricky points, and several applications are given to show how these functions work in practice (e.g. Casimir effect, gravity and string theory, high-temperature phase transition, topological symmetry breaking). The formulas, some of which are new, can be used for accurate numerical calculations. A basic introduction together with a collection of exercises for those who want to apply this regularization procedure in practice.

L. Pittner

Algebraic Foundations of Non-Commutative Differential Geometry and Quantum Groups

(New Series m 28)

1996. XII, 469 pages.

Hardcover DM 94,-

ISBN 3-540-60578-8

This book, addressing scientists and postgraduates, contains a detailed and complete presentation of the algebraic framework. Introductory chapters deal with background material such as Lie and Hopf superalgebras, Lie super-bialgebras, or formal power series. Great care was taken to present a reliable collection of formulae and to unify the notation, making this volume a useful work of reference for mathematicians and mathematical physicists.
