# Crystalizing the $\boldsymbol{q}$-Analogue of Universal Enveloping Algebras 

Masaki Kashiwara<br>RIMS, Kyoto University, Kyoto 606, Japan

Received January 9, 1990

#### Abstract

For an irreducible representation of the $q$-analogue of a universal enveloping algebra, one can find a canonical base at $q=0$, named crystal base (conjectured in a general case and proven for $A_{n}, B_{n}, C_{n}$ and $D_{n}$ ). The crystal base has a structure of a colored oriented graph, named crystal graph. The crystal base of the tensor product (respectively the direct sum) is the tensor product (respectively the union) of the crystal base. The crystal graph of the tensor product is also explicitly described. This gives a combinatorial description of the decomposition of the tensor product into irreducible components.

## 0. Introduction

The $q$-analogue of a universal enveloping algebra introduced by Drinfeld [2] and Jimbo [3] is a deformation of the universal enveloping algebra at $q=1$. Since $q=0$ corresponds to the absolute temperature zero in the lattice model defined by the $R$-matrix, we can expect that the $q$-analogue has a simple structure in that case. Some indications have been already observed in Date-Jimbo-Miwa [1], where the Gelfand-Tsetlin bases become monomes in the tensor algebra of the fundamental representation when $q=0$. In this note, we shall clarify this phenomenon. For an irreducible representation of the $q$-analogue, we can find a canonical base at $q=0$, named crystal base (conjectured in a general case and proven in $A_{n}, B_{n}, C_{n}, D_{n}$ ). The crystal base of the tensor product is the tensor product of the crystal bases. Moreover the crystal base has a structure of colored oriented graph (called crystal graph). The crystal graph of the tensor product is explicitly described.

We shall state our results more precisely. We introduce operators $\tilde{e}_{i}$ and $\tilde{f}_{i}$ by modifying the simple root vectors $e_{i}$ and $f_{i}$ of the $q$-analogue $U_{q}$ (see Sect. 3). Let $M$ be an integrable representation of $U_{q}$ defined over $\mathbf{Q}(q)$. We consider a pair ( $L, B$ ) of a lattice $L$ of $M$ defined over the ring of rational functions in $q$ regular
at $q=0$ and a base $B$ of the $\mathbf{Q}$-vector space $L / q L$. Such a pair $(L, B)$ is called crystal base if it satisfies certain axioms (see Sect. 4). Although we do not write them here, $\underset{\sim}{w}$ only note the most important axiom: $\tilde{e}_{i} L \subset L, \tilde{f}_{i} L \subset L, \tilde{e}_{i} B \subset B \cup\{0\}$ and $\tilde{f}_{i} B \subset B \cup\{0\}$. Our conjecture is the existence and the uniqueness of the crystal base and our main result is that this conjecture is true in the case of $A_{n}, B_{n}, C_{n}$ and $D_{n}$.

## 1. The $\boldsymbol{q}$-Analogue of a Universal Enveloping Algebra

Let t be a finite-dimensional vector space over $\mathbf{Q}$, and $I$ a finite index set. Let $\left\{h_{i} \in \mathrm{t} ; i \in I\right\}$ and $\left\{\alpha_{i} \in \mathfrak{t}^{*} ; i \in I\right\}$ be linearly independent sets, such that $\left\{\left\langle h_{i}, \alpha_{j}\right\rangle\right\}_{i, j}$ is a symmetrizable generalized Cartan matrix. Let us take an inner product (, ) of $\mathrm{t}^{*}$ such that $2\left(\alpha_{i}, \lambda\right)=\left(\alpha_{i}, \alpha_{i}\right)\left\langle h_{i}, \lambda\right\rangle$ and $\left(\alpha_{i}, \alpha_{i}\right)$ is a strictly positive integer for any $i \in I$ and any $\lambda \in t^{*}$. Let $P \subset t^{*}$ be a lattice such that $\left\langle h_{i}, P\right\rangle \in \mathbf{Z}$ for any $i$ and $P \supset Q \underset{\text { def }}{=} \sum_{i} \mathbf{Z} \alpha_{i}$. Then, we have

$$
\begin{equation*}
(P, Q) \in \mathbf{Z} / 2 \quad \text { and } \quad(\lambda, \lambda)-(\mu, \mu) \in \mathbf{Z} \quad \text { if } \quad \lambda, \mu \in P \quad \text { and } \quad \lambda-\mu \in Q . \tag{1.0}
\end{equation*}
$$

Let $P^{*} \subset \mathrm{t}$ denote the dual lattice of $P$.
Let $U_{q}$ be the algebra over $\mathbf{Q}(q)$ generated by the symbols $q^{h}\left(h \in P^{*}\right), e_{i}, f_{i}(i \in I)$ satisfying the following fundamental relations.

$$
\begin{align*}
q^{h+h^{\prime}} & =q^{h} \cdot q^{h \prime} \quad \text { for } h, h^{\prime} \in P^{*} \quad \text { and } q^{0}=1 .  \tag{1.1}\\
q^{h} e_{i} q^{-h} & =q^{\left\langle h, \alpha_{i}\right\rangle} e_{i} \quad \text { and } q^{h} f_{i} q^{-h}=q^{\left\langle h, \alpha_{i}\right\rangle} f_{i} \text { for } h \in P^{*} \text { and } i \in I . \tag{1.2}
\end{align*}
$$

Setting $t_{i}=q^{\left(\alpha_{i}, \alpha_{i}\right) h_{i}}$,

$$
\begin{equation*}
\left[e_{i}, f_{j}\right]=\delta_{i j} \frac{t_{i}-t_{i}^{-1}}{q^{\left(\alpha_{i}, \alpha_{i}\right)}-q^{-\left(\alpha_{i}, \alpha_{i}\right)}} . \tag{1.3}
\end{equation*}
$$

We have therefore
and

$$
t_{i} e_{j} t_{i}^{-1}=q^{2\left(\alpha_{i}, \alpha_{j}\right)} e_{j}
$$

$$
\begin{equation*}
t_{i} f_{j} t_{i}^{-1}=q^{-2\left(\alpha_{i}, \alpha_{j}\right)} f_{j} \tag{1.4}
\end{equation*}
$$

The comultiplication $\Delta: U_{q} \rightarrow U_{q} \otimes U_{q}$ is given by

$$
\begin{aligned}
\Delta\left(q^{h}\right) & =q^{h} \otimes q^{h} \\
\Delta\left(e_{i}\right) & =e_{i} \otimes 1+t_{i} \otimes e_{i}
\end{aligned}
$$

and

$$
\begin{equation*}
\Delta\left(f_{i}\right)=f_{i} \otimes t_{i}^{-1}+1 \otimes f_{i} \tag{1.5}
\end{equation*}
$$

By this, the tensor product of $U_{q}$-modules becomes a $U_{q}$-module.
A $U_{q}$-module $M$ is called integrable if $M_{\lambda}=\left\{u \in M ; q^{h} u=q^{\langle n, \lambda\rangle} u\right\}$ is finitedimensional for any $\lambda \in P, M=\bigoplus_{\lambda \in P} M_{\lambda}$ and, for any $i, M$ is a union of finitedimensional representations over the subalgebra generated by $e_{i}$ and $f_{i}$. An element of $M_{\lambda}$ is called a weight vector of weight $\lambda$. An integrable $U_{q}$-module $M$ is called with highest weights, if there is a finite set $F$ of $P$ such that

$$
M=\bigoplus_{\lambda \in F+Q_{-}} M_{\lambda}
$$

where $Q_{-}=\left\{\sum m_{i} \alpha_{i} ; m_{i} \in \mathbf{Z}_{\leqq 0}\right\}$. It is known (Rosso [5], Lusztig [4]) that the category of integrable $U_{q}$-modules with highest weights is semi-simple. For $\lambda \in P_{+}=\left\{\lambda \in P ;\left\langle h_{i}, \lambda\right\rangle \geqq 0\right\}$, let $\mathscr{M}(\lambda)$ denote an irreducible $U_{q}$-module with highest weight $\lambda$ and $u_{\lambda}$ a highest weight vector of $\mathscr{M}(\lambda)$.

## 2. $s l_{2}$-Case

Let us review the $s l_{2}$ case. Let $U_{q}\left(s l_{2}\right)$ be the algebra over $\mathbf{Q}(q)$ generated by $t, t^{-1}, e, f$ with the fundamental relation: tet $t^{-1}=q^{2} e ; t f t^{-1}=q^{-2} f,[e, f]=\left(t-t^{-1}\right) /\left(q-q^{-1}\right)$. Then $\Delta=q^{-1} t+q t^{-1}+\left(q-q^{-1}\right)^{2} e f-2=q t+q^{-1} t^{-1}+\left(q-q^{-1}\right)^{2} f e-2$ belongs to the center of $U_{q}\left(s l_{2}\right)$.

An $(l+1)$-dimensional irreducible representation $V_{l}$ has a basis $\left\{u_{k}\right\}_{0 \leqq k \leqq l}$ with

$$
\begin{aligned}
& t u_{k}=q^{l-2 k} u_{k}, \\
& e u_{k}=[k] u_{k-1}
\end{aligned}
$$

and

$$
\begin{equation*}
f u_{k}=[l-k] u_{k+1}, \tag{2.1}
\end{equation*}
$$

where $[n]=\left(q^{n}-q^{-n}\right) /\left(q-q^{-1}\right)$. Then $\left.\Delta\right|_{V_{l}}=q^{I+1}-2+q^{-l-1}$. Hence $\sqrt{q t \Delta}$ operates on $V_{l}$ by

$$
\begin{equation*}
\sqrt{q t \Delta} u_{k}=q^{-k}\left(1-q^{l+1}\right) u_{k} . \tag{2.2}
\end{equation*}
$$

Now define $\tilde{e}$ and $\tilde{f}$ by

$$
\begin{equation*}
\tilde{e}=(q t \Delta)^{-1 / 2} e \quad \text { and } \quad \tilde{f}=\left(q t^{-1} \Delta\right)^{-1 / 2} f \tag{2.3}
\end{equation*}
$$

Then we have

$$
\begin{align*}
& \tilde{e} u_{k}=\left(1-q^{2 k}\right)\left(1-q^{2}\right)^{-1}\left(1-q^{l+1}\right)^{-1} u_{k-1} \\
& \tilde{f} u_{k}=\left(1-q^{2(l-k)}\right)\left(1-q^{2}\right)^{-1}\left(1-q^{l+1}\right)^{-1} u_{k+1} \tag{2.4}
\end{align*}
$$

Since $\tilde{e}$ and $\tilde{f}$ operate on $V_{l}, \tilde{e}$ and $\tilde{f}$ operate on any integrable representation of $U_{q}\left(s l_{2}\right)$.

Let $A$ be the ring of rational functions in $q$ regular at $q=0$ and $L=\oplus A u_{k}$. Then we have $\tilde{e} L \subset L$ and $\tilde{f} L \subset L$. Furthermore, $\tilde{e}$ and $\tilde{f}$ have the property:

$$
\tilde{e} u_{k} \equiv u_{k-1} \bmod q L \quad \text { for } \quad 0<k \leqq l
$$

and

$$
\begin{equation*}
\tilde{f} u_{k} \equiv u_{k+1} \bmod q L \quad \text { for } \quad 0 \leqq k<l . \tag{2.5}
\end{equation*}
$$

## 3. Operators $\tilde{e}_{i}$ and $\tilde{f}_{i}$

Now let us come back to the general situation in Sect. 1. For $i \in I$, set $q_{i}=q^{\left(\alpha_{i}, \alpha_{i}\right)}$, $\Delta_{i}=q_{i}^{-1} t_{i}+q_{i} t_{i}^{-1}+\left(q_{i}-q_{i}^{-1}\right)^{2} e_{i} f_{i}-2, \tilde{e}_{i}=\left(q_{i} t_{i} \Delta_{i}\right)^{-1 / 2} e_{i}$ and $\tilde{f}_{i}=\left(q_{i} t_{i}^{-1} \Delta_{i}\right)^{-1 / 2} f_{i}$. Since the subalgebra generated by $e_{i}, f_{i}$ and $t_{i}$ is isomorphic to $U_{q}\left(s l_{2}\right)$ by $q \mapsto q_{i}$, $e \mapsto e_{i}, f \mapsto f_{i}$ and $t \mapsto t_{i}$, the operators $\tilde{e}_{i}, \tilde{f}_{i}$ operate on any integrable $U_{q}$-module.

## 4. Crystal Base

Set $K=\mathbf{Q}(q)$ and let $A$ be the ring of rational functions in $q$ without pole at $q=0$. Then $A$ is a discrete valuation ring and $K$ is its fraction field. For a $K$-vector space $V$, a lattice of $V$ is, by definition, a free $A$-module $L$ such that $K \underset{A}{\bigotimes} L \cong V$.

Let $M$ be an integrable $U_{q}$-module. A crystal base $(L, B)$ of $M$ is, by definition, a pair of a lattice $L$ of $M$ and a base $B$ of the $\mathbf{Q}$-vector space $L / q L$ satisfying the following conditions (4.1)-(4.5):

$$
\begin{gather*}
L=\bigoplus_{\lambda \in P} L_{\lambda}, \quad \text { where } L_{\lambda}=L \cap M_{\lambda} .  \tag{4.1}\\
B=\bigsqcup_{\lambda} B_{\lambda} \text {, where } B_{\lambda}=B \cap\left(L_{\lambda} / q L_{\lambda}\right) .  \tag{4.2}\\
\tilde{e}_{i} L \subset L \quad \text { and } \quad \tilde{f}_{i} L \subset L \quad \text { for any } i \in I .  \tag{4.3}\\
\tilde{e}_{i} B \subset B \cup\{0\} \quad \text { and } \quad \tilde{f}_{i} B \subset B \cup\{0\} \quad \text { for any } i \in I .  \tag{4.4}\\
\text { For } u, v \in B \text { and } i \in I, u=\tilde{e}_{i} v \text { if and only if } v=\tilde{f}_{i} u . \tag{4.5}
\end{gather*}
$$

Now, we can state the conjecture.
Conjecture 1. Any integrable $U_{q}$-module has a crystal base.
More precisely, the crystal base of irreducible representations is described as follows. For $\lambda \in P_{+}$, we set

$$
\mathscr{L}(\lambda)=\sum A \tilde{f}_{i_{1}} \cdots \tilde{f}_{i_{k}} u_{\lambda} \subset \mathscr{M}(\lambda)
$$

and

$$
\mathscr{B}(\lambda)=\left\{v=\tilde{f}_{i_{1}} \cdots \tilde{f}_{i_{k}} u_{\lambda} \bmod q \mathscr{L}(\lambda) ; v \neq 0\right\} \subset \mathscr{L}(\lambda) / q \mathscr{L}(\lambda)
$$

(see Sect. 1 for $\mathscr{M}(\lambda)$ and $\left.u_{\lambda}\right)$. Here $\left(i_{1}, \ldots, i_{k}\right)(0 \leqq k)$ ranges over the set of sequences in $I$.
Conjecture 2. For any $\lambda \in P_{+}$the following property holds:

$$
C(\lambda):(\mathscr{L}(\lambda), \mathscr{B}(\lambda)) \text { is a crystal base of } \mathscr{M}(\lambda) .
$$

As we shall see in Lemma 2 and Proposition 4, the following conjecture is a consequence of Conjectures 1 and 2.
Conjecture 3. For any crystal base $(L, B)$ of any integrable $U_{q}$-module with highest weights, we have

$$
C(L, B): \text { for any } u \in B \text { such that } \tilde{e}_{i} u=0 \text { for any } i \text {, there exists }
$$

$u^{\prime} \in L$ such that $u=u^{\prime} \bmod q L$ and $e_{i} u^{\prime}=0$ for any $i$.
Note that $C(L, B)$ is equivalent to the following condition:
$C(L)$ : for any $u \in L / q L$ such that $\tilde{e}_{i} u=0$ for any $i$, there exists $u^{\prime} \in L$ such that $u=u^{\prime} \bmod q L$ and $e_{i} u^{\prime}=0$ for any $i$.
In the $s l_{2}$-case, a crystal base of $V_{l}$ is given by $L=\bigoplus_{j=0}^{l} A u_{j}$ and $B=\left\{u_{j} \bmod q L\right.$;
$j=0, \ldots, l\}$ under the notation in Sect. 2. Therefore, Conjectures 1 and 2 are true in the $s l_{2}$-case.

One of our main results is the following theorem.
Theorem. Conjectures 1 and 2 are true for $A_{n}, B_{n}, C_{n}$ and $D_{n}$.
We shall start by the following elementary property of crystal bases:
Lemma 1. If $\left(L_{j}, B_{j}\right)$ is a crystal base of $M_{j}(j=1,2, \ldots, r)$, then $\oplus\left(L_{j}, B_{j}\right)$ is a crystal base of $\oplus M_{j}$. Here $\oplus\left(L_{j}, B_{j}\right)=(L, B)$ with $L=\oplus L_{j}$ and $B=\bigsqcup_{j} B_{j}$.

In the sequel, $(L, B) \oplus \cdots \oplus(L, B)$ ( $m$-times) will be denoted by $(L, B)^{\oplus m}$.
Lemma 2. Let $\lambda \in P_{+}$. If $(\mathscr{L}(\lambda), \mathscr{B}(\lambda))$ is a crystal base of $\mathscr{M}(\lambda)$, then $C(\mathscr{L}(\lambda), \mathscr{B}(\lambda))$ is true.

Proof. Assume $u \in \mathscr{B}(\lambda)_{\mu}$ and $\tilde{e}_{i} u=0$ for any $i$. If $\lambda=\mu$, then the assertion on $u$ in $C(\mathscr{L}(\lambda), \mathscr{B}(\lambda))$ is evident. Otherwise, there exist $v \in \mathscr{B}(\lambda)$ and $i$ such that $u=\tilde{f}_{i} v$, and hence $\tilde{e}_{i} u=v \neq 0$.

## 5. Polarization

Let $(L, B)$ be a crystal base of an integrable $U_{q}$-module $M$. A polarization of $(L, B)$ is a $K$-valued inner product of $M$ satisfying the following conditions (5.1), (5.2) and (5.3):

$$
\left(e_{i} u, v\right)=\left(u, q_{i} t_{i} f_{i} v\right),\left(f_{i} u, v\right)=\left(u, q_{i}^{-1} e_{i} t_{i}^{-1} v\right)
$$

and

$$
\begin{equation*}
\left(q^{h} u, v\right)=\left(u, q^{h} v\right) \quad \text { for any } \quad h \in P^{*}, i \in I \quad \text { and } \quad u, v \in M \tag{5.1}
\end{equation*}
$$

Hence $\left(M_{\lambda}, M_{\mu}\right)=0$ if $\lambda \neq \mu$,

$$
\begin{equation*}
(L, L) \subset A . \tag{5.2}
\end{equation*}
$$

Let (, $)_{0}$ be the $\mathbf{Q}$-valued inner product on $L / q L$ induced by (, ).

$$
\begin{equation*}
(u, v)_{0}=\delta_{u, v} \quad \text { for any } \quad u, v \in B . \tag{5.3}
\end{equation*}
$$

By (5.1), we have

$$
\begin{equation*}
\left(\tilde{e}_{i} u, v\right)=\left(u, \tilde{f}_{i} v\right) . \tag{5.4}
\end{equation*}
$$

Remark that by (5.3), we have

$$
\begin{equation*}
L=\{u \in M ;(L, u) \subset A\} . \tag{5.5}
\end{equation*}
$$

If we define $\langle u, v\rangle=q^{(\lambda, \lambda)}(u, v)$ for $u, v \in M_{\lambda}$ and extend this to the inner product of $M$, then one has

$$
\begin{array}{ll}
\left\langle e_{i} u, v\right\rangle=\left\langle u, f_{i} v\right\rangle & \text { and }\left\langle q^{h} u, v\right\rangle=\left\langle u, q^{h} v\right\rangle \\
& \text { for } h \in P^{*}, i \in I \text { and } u, v \in M . \tag{5.6}
\end{array}
$$

Remark also that, for any $\lambda \in P_{+}, \mathscr{M}(\lambda)$ has always an inner product satisfying (5.1).

Lemma 3. For $\lambda \in P_{+}$, assume $C(\lambda)$. Then $(\mathscr{L}(\lambda), \mathscr{B}(\lambda))$ is polarizable.
Proof. Let us take an inner product (, ) satisfying (5.1) and $\left(u_{\lambda}, u_{\lambda}\right)=1$. We shall show

$$
\begin{gather*}
\left(\mathscr{L}(\lambda)_{\mu}, \mathscr{L}(\lambda)_{\mu}\right) \subset A  \tag{5.7}\\
(u, v)_{0}=\delta_{u, v} \quad \text { for } \quad u, v \in \mathscr{B}(\lambda)_{\mu} \tag{5.8}
\end{gather*}
$$

by the induction on $\mu \in P$.
We may assume $\mu \neq \lambda$ and (5.7) and (5.8) are true for $\mu+\alpha_{i}$ for any $i$. Then, one has

$$
\left(\widetilde{f}_{i} \mathscr{L}(\lambda)_{\mu+\alpha_{i}}, \mathscr{L}(\lambda)_{\mu}\right) \subset\left(\mathscr{L}(\lambda)_{\mu+\alpha_{i}}, \tilde{e}_{i} \mathscr{L}(\lambda)_{\mu}\right) \subset\left(\mathscr{L}(\lambda)_{\mu+\alpha_{i}}, \mathscr{L}(\lambda)_{\mu+\alpha_{i}}\right) \subset A
$$

and hence $\mathscr{L}(\lambda)_{\mu}=\sum_{i} \tilde{f}_{i} \mathscr{L}(\lambda)_{\mu+\alpha_{i}}$ implies (5.7).
Similarly, for $u \in \mathscr{B}(\lambda)_{\mu}$, there is $i$ such that $\tilde{e}_{i} u \neq 0$. Hence $u=\tilde{f}_{i} \tilde{e}_{i} u$ and $(u, v)_{0}=\left(\tilde{f}_{i} \tilde{e}_{i} u, v\right)_{0}=\left(\tilde{e}_{i} u, \tilde{e}_{i} v\right)_{0}=\delta_{\tilde{e}_{i} u, \tilde{e}_{i} v}=\delta_{u, v} . \quad$ Q.E.D.

The following proposition asserts that any crystal base is a direct sum of ( $\mathscr{L}(\lambda), \mathscr{B}(\lambda))$ when Conjecture 2 is true.
Proposition 4. Let $\lambda \in P_{+}$and assume $C(\lambda)$. Let $M$ be a $U_{q}$-module isomorphic to $\mathscr{M}(\lambda)^{\oplus m}$ and $N$ an integrable $U_{q}$-module such that $N_{\lambda}=0$. Let $(L, B)$ be a crystal base of $M \oplus N$. Set $L_{M}=L \cap M, L_{N}=L \cap N, B_{M}=B \cap\left(L_{M} / q L_{M}\right)$ and $B_{N}=B \cap\left(L_{N} / q L_{N}\right)$. Then we have
(i) $L=L_{M} \oplus L_{N}$ and $B=B_{M} \sqcup B_{N}$.
(ii) $\left(L_{N}, B_{N}\right)$ and $\left(L_{M}, B_{M}\right)$ are a crystal base of $N$ and $M$, respectively.
(iii) There is an isomorphism $M \cong \mathscr{M}(\lambda)^{\oplus m}$ by which $\left(L_{M}, B_{M}\right) \cong(\mathscr{L}(\lambda), \mathscr{B}(\lambda))^{\oplus m}$.

Proof. Since $L_{N} \cap q L=q L_{N}$, we have $L_{N} / q L_{N} \subset L / q L$. Similarly, $L_{M} / q L_{M} \subset L / q L$. Setting $\left(L_{0}, B_{0}\right)=\left(\mathscr{L}(\lambda), \mathscr{B}(\lambda)^{\oplus m}\right.$, we may choose an isomorphism $M \cong \mathscr{M}(\lambda)^{\oplus m}$ such that $L_{\lambda}=L_{0 \lambda}$ and $B_{\lambda}=B_{0 \lambda}$. By the preceding lemma, $\left(L_{0}, B_{0}\right)$ admits a polarization $($,$) . We shall show first that for any \mu \in P$

$$
\begin{equation*}
\left(L_{0 \mu}, L_{M \mu}\right) \subset A \tag{5.9}
\end{equation*}
$$

By the induction we may assume $\mu \neq \lambda$ and (5.9) holds for all $\mu+\alpha_{i}$. Then $\left(\tilde{f}_{i} L_{0 \mu+a_{i}}, L_{M \mu}\right) \subset\left(L_{0 \mu+a_{i}}, \tilde{e}_{i} L_{M \mu+a_{i}}\right) \subset A$, and hence $L_{0 \mu}=\Sigma \tilde{f}_{i} L_{0 \mu+\alpha_{i}}$ implies (5.9). Since $L_{0} \subset L_{M}$ and that $L_{M} \supset L_{0}$ by (5.5), we obtain $L_{0}=L_{M}$. Since $B_{0} \subset B_{m}$, we have $B_{0}=B_{M}$. This shows (iii). Next, we shall show

$$
\begin{equation*}
L_{\mu}=\left(L_{M}\right)_{\mu}+\left(L_{N}\right)_{\mu} \tag{5.10}
\end{equation*}
$$

In order to show this, we shall prove

$$
\begin{equation*}
q L_{\mu} \cap\left(\left(L_{M}\right)_{\mu}+\left(L_{N}\right)_{\mu}\right) \subset q\left(L_{M}\right)_{\mu}+q\left(L_{N}\right)_{\mu} \tag{5.11}
\end{equation*}
$$

Let $u \in\left(L_{M}\right)_{\mu}, v \in\left(L_{N}\right)_{\mu}$ satisfies $u+v \in q L$. Let $\bar{u} \in L_{M} / q L_{M}$ be $u \bmod q L_{M}$. Then there exist a set $J$ of sequences $\sigma=(\sigma(1), \ldots, \sigma(p))$ in $I$ and $u_{\sigma} \in\left(L_{M}\right)_{\lambda}$ such that

$$
\bar{u} \equiv \sum_{\sigma \in J} \tilde{f}^{\sigma} \bar{u}_{\sigma}
$$

where $\bar{u}_{\sigma}$ is $u_{\sigma} \bmod q L_{M}$ and $\tilde{f}^{\sigma}=\tilde{f}_{\sigma(1)} \cdots \tilde{f}_{\sigma(p)}$. We may assume further that $|J|$ is minimal among such expressions. In particular $\left\{\tilde{f}^{\sigma} \bar{u}_{\sigma}\right\}_{\sigma \in J}$ is linearly independent.

Hence $\tilde{f}^{\sigma} \bar{u}_{\lambda} \in \mathscr{B}(\lambda)$, where $\bar{u}_{\lambda}$ is $u_{\lambda} \bmod q \mathscr{L}(\lambda)$. Hence, setting $\tilde{e}^{\sigma}=\tilde{e}_{\sigma(p)} \cdots \tilde{e}_{\sigma(1)}$, we have $\tilde{e}^{\sigma} \tilde{f}^{\sigma} \bar{u}_{\lambda}=\bar{u}_{\lambda}$, which implies

$$
\begin{equation*}
\tilde{e}^{\sigma} \tilde{f}^{\sigma} \bar{u}_{\sigma}=\bar{u}_{\sigma} . \tag{5.12}
\end{equation*}
$$

We have also

$$
\begin{equation*}
\tilde{e}^{\tau} \tilde{f}^{\sigma} \bar{u}_{\sigma}=0 \text { for } \sigma \neq \tau \tag{5.13}
\end{equation*}
$$

In fact, otherwise $\tilde{e}^{\tau} \tilde{f}^{\sigma} \bar{u}_{\lambda}=\bar{u}_{\lambda}$ and hence $\tilde{f}^{\sigma} \bar{u}_{\lambda}=\tilde{f}^{\tau} \bar{u}_{\lambda}$, which implies $\tilde{f}^{\sigma} \bar{u}_{\sigma}=\tilde{f}^{\tau} \bar{u}_{\sigma}$. Therefore, $\tilde{f}^{\sigma} \bar{u}_{\sigma}+\tilde{f}^{\tau} \bar{u}_{\tau}=\tilde{f}^{\tau}\left(\bar{u}_{\sigma}+\bar{u}_{\tau}\right)$ and this contradicts the minimality condition on $J$. Thus, we have

$$
\sum_{\sigma \in J} \tilde{f}^{\sigma} \tilde{e}^{\sigma} \bar{u}=\sum_{\sigma \in J} \sum_{\tau \in J} \tilde{f}^{\sigma} \tilde{e}^{\sigma} \tilde{f}^{\tau} \bar{u}_{\tau}=\sum_{\sigma} \tilde{f}^{\sigma} \bar{u}_{\sigma}=\bar{u}
$$

Therefore $\sum \tilde{f}^{\sigma} \tilde{e}^{\sigma} u \equiv u \bmod q L$. Because $u+v \in q L$, one has

$$
u \equiv-\sum \tilde{f}^{\sigma} \tilde{e}^{\sigma} v \bmod q L
$$

Now $N_{\lambda}=0$ implies $\tilde{e}^{\sigma} v=0$, and we conclude $u \in q L$ and $v \in q L$. Thus we obtain (5.11) and hence (5.10).

Now it remains to prove

$$
\begin{equation*}
B \subset B_{M} \cup B_{N} \tag{5.14}
\end{equation*}
$$

Let us prove, for any $\mu \in P$

$$
\begin{equation*}
B_{\mu} \subset\left(B_{M}\right)_{\mu} \cup\left(B_{N}\right)_{\mu} \tag{5.15}
\end{equation*}
$$

We may assume that $\mu$ is a weight of $\mathscr{M}(\lambda)$. By the induction, we may assume further that (5.15) holds for all $\mu+\alpha_{i}$. If $\mu=\lambda$, (5.15) is trivial, and therefore we may assume $\mu \neq \lambda$. For $u \in B_{\mu}$, if there is $i$ such that $\tilde{e}_{i} u \neq 0$, then $u=\tilde{f}_{i} \tilde{e}_{i} u \in \tilde{f}_{i}\left(\left(B_{M}\right)_{\mu+\alpha_{i}} \cup\right.$ $\left.\left(B_{N}\right)_{\mu+\alpha_{i}}\right) \backslash\{0\} \subset\left(B_{M}\right)_{\mu} \cup\left(B_{N}\right)_{\mu}$. Otherwise we have $\tilde{e}_{i} u=0$ for any $i$. Write $u=u_{1}+u_{2}$ with $u_{1} \in L_{M} / q L_{M}$ and $u_{2} \in L_{N} / q L_{N}$. Then $\tilde{e}_{i} u_{1}=0$. The condition $C(\mathscr{L}(\lambda), \mathscr{B}(\lambda))$ and $\mu \neq \lambda$ implies $u_{1}=0$. Finally we conclude $u \in\left(B_{N}\right)_{\mu}$. Q.E.D.
Proposition 5. Let $M_{j}$ be an integrable $U_{q}$-module and $(L, B)$ a crystal base of $\oplus_{j} M_{j}$ with a polarization ( , ). If $\left(M_{j}, M_{k}\right)=0$ for $j \neq k$, then $L=\bigoplus_{j}\left(L \cap M_{j}\right)$.
Proof. Setting $L_{j}=L \cap M_{j}$, it is enough to show

$$
\begin{equation*}
q L \cap \oplus L_{j} \subset \oplus q L_{j} \tag{5.16}
\end{equation*}
$$

Let $u_{j} \in L_{j}$ and assume $\sum_{j} u_{j} \in q L$. Then we have $\left(\sum_{j} u_{j}, \sum_{j} u_{j}\right)=\sum_{j}\left(u_{j}, u_{j}\right) \in q A$. Hence $\left.\left(u_{j}, u_{j}\right)\right|_{0}=0$ because $(,)_{0}$ is positive definite on $L / q L$. Therefore $u_{j} \in q L$. Q.E.D.

## 6. Tensor Product of Crystal Bases

Let $(L, B)$ be a crystal base of an integrable $U_{q}$-module $M$ with highest weights. Then $B$ has a structure of colored oriented graph. The colors are labelled by $I$. For $u, v \in B, u \xrightarrow{i} v$ when $v=\tilde{f}_{i} u$. We shall call this graph the crystal graph of $M$. Remark that, for any $i$, the crystal graph with only arrows colored by $i$ has no
branch points and hence a disjoint union of sequences of arrows. The following proposition describes the crystal graph of the tensor product.
Proposition 6. Let $\left(L_{j}, B_{j}\right)$ be a crystal base of an integrable $U_{q}$-module $M_{j}(j=1,2)$. (a) Then $\left(L_{1}, B_{1}\right) \otimes\left(L_{2}, B_{2}\right) \underset{\text { def }}{=}\left(L_{1} \otimes L_{2}, B_{1} \times B_{2}\right)$ is a crystal base of $V_{1} \otimes V_{2}$. Here $B_{1} \times B_{2} \hookrightarrow L_{1} \otimes L_{2} / q\left(L_{1} \otimes L_{2}\right) \cong\left(L_{1} / q L_{1}\right) \otimes\left(L_{2} / q L_{2}\right)$ is given by $(u, v) \mapsto u \otimes v$.
(b) For $u \in B_{1}, v \in B_{2}$, we have

$$
\begin{align*}
& \tilde{f}_{i}(u \otimes v)= \begin{cases}\tilde{f}_{i} u \otimes v & \text { if there exists } n \geqq 1 \text { such that } \tilde{f}_{i}^{n} u \neq 0 \text { and } \tilde{e}_{i}^{n} v=0, \\
u \otimes \tilde{f}_{i} v & \text { otherwise. }\end{cases}  \tag{6.1}\\
& \tilde{e}_{i}(u \otimes v)= \begin{cases}u \otimes \tilde{e}_{i} v & \text { if there exists } n \geqq 1 \text { such that } \tilde{e}_{i}^{n} v \neq 0 \text { and } \tilde{f}_{i}^{n} u=0, \\
\tilde{e}_{i} u \otimes v & \text { otherwise. }\end{cases} \tag{6.2}
\end{align*}
$$

(c) If $(,)_{j}$ is a polarization of $\left(L_{j}, B_{j}\right)$, then $\left(u_{1} \otimes u_{2}, v_{1} \otimes v_{2}\right)=\left(u_{1}, v_{1}\right)_{1} .\left(u_{2}, v_{2}\right)_{2}$ gives a polarization of $\left(L_{1}, B_{1}\right) \otimes\left(L_{2}, B_{2}\right)$.

This can be visualized as follows.

## 7. Proof of Proposition 6

Since (c) follows easily from (a), we shall prove (a) and (b). Since it is enough to check for each $i$, we can reduce to the $s l_{2}$-case. Then we can reduce to the irreducible case by Proposition 4. Note that Conjecture 2 is true in the $s l_{2}$-case. Set $M_{1}=V_{m}$ and $M_{2}=V_{l}$ (see Sect. 2). Let $u_{0}, \ldots, u_{m}$ and $v_{0}, \ldots, v_{l}$ be the base of $M_{1}$ and $M_{2}$ given in Sect. 2. Then $L_{1}=\bigoplus_{j=0}^{m} A u_{j}, L_{2}=\bigoplus_{k=0}^{l} A v_{k}$ and $B_{1}=\left\{u_{j} \bmod q L_{1}\right\}$, $B_{2}=\left\{v_{k} \bmod q L_{2}\right\}$. Set $L=L_{1} \otimes L_{2}$ and $M=M_{1} \otimes M_{2}$.
(i) First let us prove the case when $m=1$. Then $M=N_{1} \oplus N_{2}$, where $N_{1}$ is generated by $w=u_{0} \otimes v_{0}$ and $N_{2}$ is generated by $z=u_{0} \otimes v_{1}-q u_{1} \otimes v_{0}$. Setting

$$
\begin{aligned}
w_{k} & =\frac{1}{[l+1]}\left([l-k+1] u_{0} \otimes v_{k}+q^{k-1-l}[k] u_{1} \otimes v_{k-1}\right) \\
& =q^{k} \frac{1-q^{2 l-2 k+2}}{1-q^{2 l-2}} u_{0} \otimes v_{k}+\frac{1-q^{2 k}}{1-q^{2 l-2}} u_{1} \otimes v_{k-1}
\end{aligned}
$$

for $0 \leqq k \leqq l+1$ (with $v_{l+1}=0$ ), we have

$$
\begin{aligned}
w_{0} & =w \\
f w_{k} & =[l+1-k] w_{k+1} .
\end{aligned}
$$

Hence $L_{1}=\bigoplus_{k=0}^{l+1} A w_{k}$ and $B_{1}=\left\{w_{k} \bmod q L_{1} ; 0 \leqq k \leqq l+1\right\}$ form a crystal base of $N_{1}$.
Setting

$$
z_{k}=u_{0} \otimes v_{k+1}-q^{k+1} u_{1} \otimes v_{k}
$$

for $0 \leqq k \leqq l-1$, we have

$$
\begin{aligned}
z_{0} & =z \\
f z_{k} & =[l-1-k] z_{k+1}
\end{aligned}
$$

Hence $L_{2}=\bigoplus_{k=0}^{l-1} A z_{k}$ and $B_{2}=\left\{z_{k} \bmod q L_{2} ; 0 \leqq k \leqq l-1\right\}$ from a crystal base. Since $w_{0} \equiv u_{0} \otimes v_{0}, w_{k} \equiv u_{1} \otimes v_{k-1}$ and $z_{k} \equiv u_{0} \otimes v_{k+1}$ modulo $q L$, we obtain the desired result.
(ii) The general case. Assuming that the statement is proven for $V_{m-1} \otimes V_{l}$, we shall prove the statement for $V_{m} \otimes V_{l}$ for $m \geqq 2$. Let $\left(L_{l}, B_{l}\right)$ be a crystal base of $M_{l}$. By the hypothesis, $\left(L_{m-1}, B_{m-1}\right) \otimes\left(L_{l}, B_{l}\right)$ is a crystal base of $V_{m-1} \otimes V_{l}$. Then by (i), $\left(L_{1}, B_{1}\right) \otimes\left(L_{m-1}, B_{m-1}\right) \otimes\left(L_{l}, B_{l}\right)$ is a crystal base of $V_{1} \otimes V_{m-1} \otimes V_{l}$. By (i) and Proposition 4, we have $\left(L_{1}, B_{1}\right) \otimes\left(L_{m-1}, B_{m-1}\right)=\left(L_{m}, B_{m}\right) \oplus\left(L_{m-2}, B_{m-2}\right)$. Therefor, $\left(L_{m}, B_{m}\right) \otimes\left(L_{l}, B_{l}\right) \oplus\left(L_{m-2}, B_{m-2}\right) \otimes\left(L_{l}, B_{l}\right)$ is a crystal base of $V_{m} \otimes V_{l} \oplus$ $V_{m-2} \otimes V_{l}$. Hence, its direct summand $\left(L_{m}, B_{m}\right) \otimes\left(L_{l}, B_{l}\right)$ is a crystal base of $V_{m} \otimes V_{l}$. This shows (i). Since we know the actions of $\tilde{e}$ and $\tilde{f}$ on $B_{m-1} \times B_{l}$ and hence those on $B_{1} \times B_{m-1} \times B_{l}$ and those on $B_{m} \times B_{l} \subset B_{1} \times B_{m-1} \times B_{l}$. Then explicit calculations show (ii).

## 8. Proof of Theorem

In order to prove Theorem, we shall prepare
Lemma 7. Let $\lambda_{0}, \lambda_{1} \in P_{+}$. We assume

$$
\begin{gather*}
C\left(\lambda_{0}\right) \quad \text { and } C\left(\lambda_{1}\right) \text { hold. }  \tag{8.1}\\
\operatorname{dim} \mathscr{M}\left(\lambda_{0}\right)_{\lambda}=1 \quad \text { for any weight } \lambda \text { of } \mathscr{M}\left(\lambda_{0}\right)  \tag{8.2}\\
\mathscr{M}\left(\lambda_{1}\right) \otimes \mathscr{M}\left(\lambda_{0}\right)=\sum_{\mu \in S} \mathscr{M}\left(\lambda_{1}+\mu\right) \tag{8.3}
\end{gather*}
$$

where $S$ is the set of weights $\mu$ of $\mathscr{M}\left(\lambda_{0}\right)$ such that $u \in \mathscr{B}\left(\lambda_{0}\right)_{\mu}$ satisfies $\tilde{e}_{i}^{1+\left\langle h_{i}, \lambda_{1}\right\rangle} u=0$ for any i.

Then $C\left(\lambda_{1}+\mu\right)$ is true for any $\mu \in S$.
Remark. (i) (8.3) is a consequence of Conjecture even without (8.2) (cf. the proof below).
(ii) We have $\lambda_{1}+S \subset P_{+}$by the observation below.
(iii) Let $(L, B)$ be a crystal base of an integrable $U_{q}$-module $M_{0}$. Then, for any $i \in I, \mu \in P$ and $n \geqq 1, e_{i}^{n} M_{\mu}=0$ if and only if $\tilde{e}_{i}^{n} B_{\mu}=0$. This can be easily checked by reducing it to the irreducible representations of $U_{q}\left(s l_{2}\right)$.
Proof. Let $M=\mathscr{M}\left(\lambda_{1}\right) \otimes \mathscr{M}\left(\lambda_{0}\right), L=\mathscr{L}\left(\lambda_{1}\right) \otimes \mathscr{L}\left(\lambda_{0}\right)$ and $B=\mathscr{B}\left(\lambda_{1}\right) \times \mathscr{B}\left(\lambda_{0}\right)$. Since $\left(\mathscr{L}\left(\lambda_{v}\right), \mathscr{B}\left(\lambda_{v}\right)\right)$ is a polarizable crystal base of $\mathscr{M}\left(\lambda_{v}\right)(v=0,1),(L, B)$ is a polarizable
crystal base of $M$. Let $M=\oplus M_{j}$ be an irreducible decomposition of $M$. Set $L_{j}=L \cap M_{j}$ and $B_{j}=B \cap\left(L_{j} / q L_{j}\right)$. Then, by Proposition 5 we have $L=\oplus L_{j}$. We shall show

$$
\begin{equation*}
B=\bigcup_{j} B_{j} \tag{8.4}
\end{equation*}
$$

In order to prove this it is enough to show that for $\mu \in P$,

$$
\begin{equation*}
\text { if } u \in B_{\mu} \text { satisfies } \tilde{e}_{i} u=0 \text { for any } i \text {, then } u \in B_{j} \text { for some } j \tag{8.5}
\end{equation*}
$$

Write $u=u_{1} \otimes u_{0}$ with $u_{v} \in \mathscr{B}\left(\lambda_{v}\right)$. Then, by Proposition 6 , we have $\tilde{e}_{i} u_{1}=0$ for any $i$ and $\tilde{e}_{i}^{1+\left\langle n_{i}, \lambda_{1}\right\rangle} u_{2}=0$. Hence $u_{1}=\bar{u}_{\lambda_{1}}$, where $\bar{u}_{\lambda_{1}}=u_{\lambda_{1}} \bmod q \mathscr{L}\left(\lambda_{1}\right)$. We have therefore

$$
\begin{equation*}
\left\{u \in B ; \tilde{e}_{i} u=0 \text { for any } i\right\}=\left\{\bar{u}_{\lambda_{1}}\right\} \times S . \tag{8.6}
\end{equation*}
$$

This implies that for any $\mu \in P$,

$$
\left\{v \in(L / q L)_{\mu} ; \tilde{e}_{i} v=0 \text { for any } i\right\} \subset \bar{u}\left(\lambda_{1}\right) \otimes \mathscr{L}\left(\lambda_{0}\right)_{\mu-\lambda_{1}}
$$

and hence it is one-dimensional. Since we have

$$
\begin{aligned}
& \left\{v \in(L / q L)_{\mu} ; \tilde{e}_{i} v=0 \text { for any } i\right\}=\bigoplus_{j}\left\{v \in\left(L_{j} / q L_{j}\right)_{\mu} ; \tilde{e}_{i} v=0 \text { for any } i\right\}, \\
& \left\{v \in\left(L_{j} / q L_{j}\right)_{\mu} ; \tilde{e}_{i} v=0 \text { for any } i\right\}=0
\end{aligned}
$$

except one $j$. Thus we obtain $u \in B_{j}$ for some $j$. This shows (8.5) and hence (8.4). This implies that $\left(L_{j}, B_{j}\right)$ is a crystal base of $M_{j}$.

Since $\sum_{j} \#\left\{u \in B_{j} ; \tilde{e}_{i} u=0\right.$ for any $\left.i\right\}=\# S$ and that this coincides with the number of irreducible components, we can conclude that, for each $j$, there exists only one $u \in B_{j}$ such that $\tilde{e}_{i} u=0$ for any $i$. Q.E.D.
Lemma 8. Let $\lambda_{0}, \lambda_{1} \in P_{+}$and assume (8.2) and

$$
\begin{equation*}
e_{i}^{2} \mathscr{M}\left(\lambda_{0}\right)=0 \quad \text { for any } i . \tag{8.7}
\end{equation*}
$$

Let us set

$$
S=\left\{\mu \in P ; \mu \text { is a weight of } \mathscr{M}\left(\lambda_{0}\right) \text { such that } e_{i}^{1+\left\langle h_{i}, \lambda_{1}\right\rangle} \mathscr{M}\left(\lambda_{0}\right)_{\mu}=0\right\} .
$$

Then, (8.3) holds.
Proof. By Weyl's character formula, it is enough to show

$$
\begin{equation*}
\left(\sum_{\xi} e^{\xi}\right)\left(\sum_{w \in W} \operatorname{sgn} e^{w\left(\lambda_{1}+\rho\right)}\right)=\sum_{\mu} \sum_{w \in W} \operatorname{sgn}(w) e^{w\left(\lambda_{1}+\mu+\rho\right)} . \tag{8.8}
\end{equation*}
$$

Here, $\xi$ ranges over the set $P_{0}$ of weights of $\mathscr{M}\left(\lambda_{0}\right)$ and $\mu$ ranges over $S$. Since the left-hand side of (8.8) equals $\sum_{\xi \in P_{0}} \sum_{w \in W} \operatorname{sgn}(w) e^{w\left(\lambda_{1}+\rho+\xi\right)}$, it is enough to show that

$$
\begin{equation*}
\sum_{w \in W} \operatorname{sgn}(w) e^{\left(\lambda_{1}+\xi+\rho\right)}=0 \tag{8.9}
\end{equation*}
$$

for any $\xi \in P_{0} \backslash S$. For such a $\xi$, there exists $i$ such that $e^{1+\left\langle h_{i}, \lambda_{1}\right\rangle} u \neq 0$ where $u$ is the weight vector with weight $\xi$. Then $\left\langle h_{i}, \lambda_{1}\right\rangle=0$ and $\left\langle h_{i}, \xi\right\rangle=-1$. They imply $s_{i}\left(\lambda_{1}+\xi+\rho\right)=0$ and hence we obtain (8.9). Here $s_{i}$ denotes the simple reflection $s_{i}(\lambda)=\lambda-\left\langle h_{i}, \lambda\right\rangle \alpha_{i}$. Q.E.D.

Let us finish the proof of the theorem. One can check easily the conjecture for the fundamental representation or the spin representations. In fact, the usual base of the fundamental representation or the base of the spin representation in Reshetikhin [6] gives a crystal base. Now, we can apply successively Lemma 7 with the fundamental representation or spin representations as $\mathscr{M}\left(\lambda_{0}\right)$. Note that the fundamental representation or the spin representations satisfy (8.2) and (8.7) and hence (8.3) follows from Lemma 8 and Remark (iii) after Lemma 7.

## 9. Decomposition

Assume that Conjectures 1 and 2 are true. Let $M$ be an integrable $U_{q}$-module with highest weights. Then $M$ is irreducible if its crystal graph (forgetting colors and directions) is connected. Since the crystal graph of the tensor product is described by Proposition 6, we can describe combinatorially the decomposition of the tensor products. The following figures describe $\square \otimes \square=\square \square \square$ and$\otimes \square=\square \oplus \phi$ in the $s l_{3}$-case.

## 10. Final Remark

Let $(L, B)$ be a crystal base of an integrable $U_{q}$-module $M$. Then one has
Proposition 9. Assume that $\lambda \in P, i \in I$ satisfy $l=\left\langle h_{i}, \lambda\right\rangle>0$. Then $\tilde{f}_{i}^{l}: L_{\lambda} \rightarrow L_{\lambda-l \alpha_{i}}$ and $\tilde{e}_{i}^{l}: L_{\lambda-l \alpha_{i}} \rightarrow L_{\lambda}$ are isomorphisms.

This is proven by reducing it to the $s l_{2}$-case.
Acknowledgements. The author would like to acknowledge E. Date, M. Jimbo, T. Miwa, T. Nakashima and M. Okado for valuable discussions with them.
