Recently, Dere and Simsek (2012) have studied the applications of umbral algebra to some special functions. In this paper, we investigate some properties of umbral calculus associated with $p$-adic invariant integrals on $\mathbf{Z}_{p}$. From our properties, we can also derive some interesting identities of Bernoulli polynomials.

## 1. Introduction

Let $p$ be a fixed prime number. Throughout this paper, $\mathbf{Z}_{p}, \mathbf{Q}_{p}$, and $\mathbf{C}_{p}$ denote the ring of $p$ adic integers, the field of $p$-adic rational numbers, and the completion of algebraic closure of $\mathrm{Q}_{p}$, respectively.

Let $\mathbf{N} \cup\{0\}$. Let $U D\left(\mathbf{Z}_{p}\right)$ be space of uniformly differentiable functions on $\mathbf{Z}_{p}$. For $f \in U D\left(\mathbf{Z}_{p}\right)$, the $p$-adic invariant integral on $\mathbf{Z}_{p}$ is defined by

$$
\begin{equation*}
\int_{\mathrm{Z}_{p}} f(x) d \mu(x)=\lim _{N \rightarrow \infty} \frac{1}{p^{N}} \sum_{x=0}^{p^{N}-1} f(x) \tag{1.1}
\end{equation*}
$$

see $[1,2]$.
From (1.1), we have

$$
\begin{equation*}
\int_{\mathrm{Z}_{p}} f(x+n) d \mu(x)-\int_{\mathrm{Z}_{p}} f(x) d \mu(x)=\sum_{l=0}^{n} f^{\prime}(l), \quad n \in \mathbf{N}, \tag{1.2}
\end{equation*}
$$

where $f^{\prime}(l)=\left.(d f(x) / d x)\right|_{x=l}$ (see [1-6]). Let $\mathbf{F}$ be the set of all formal power series in the variable $t$ over $\mathbf{C}_{p}$ with

$$
\begin{equation*}
\mathbf{F}=\left\{\left.f(t)=\sum_{k=0}^{\infty} \frac{a_{k}}{k!} t^{k} \right\rvert\, a_{k} \in \mathbf{C}_{p}\right\} . \tag{1.3}
\end{equation*}
$$

Let $\mathbb{P}=\mathbf{C}_{p}[x]$ and let $\mathbb{P}^{*}$ denote the vector space of all linear functional on $\mathbb{P}$.
The formal power series,

$$
\begin{equation*}
f(t)=\sum_{k=0}^{\infty} \frac{a_{k}}{k!} t^{k} \in \mathbf{F} \tag{1.4}
\end{equation*}
$$

defines a linear functional on $\mathbb{P}$ by setting

$$
\begin{equation*}
\left\langle f(t) \mid x^{n}\right\rangle=a_{n}, \quad \forall n \geq 0, \tag{1.5}
\end{equation*}
$$

see $[7,8]$.
In particular, by (1.4) and (1.5), we get

$$
\begin{equation*}
\left\langle t^{k} \mid x^{n}\right\rangle=n!\delta_{n, k} \tag{1.6}
\end{equation*}
$$

where $\delta_{n, k}$ is the Kronecker symbol (see [7]). Here, $\mathbf{F}$ denotes both the algebra of formal power series in $t$ and the vector space of all linear functional on $\mathbb{P}$, so an element $f(t)$ of $\mathbf{F}$ will be thought of as both a formal power series and a linear functional. We shall call $\mathbf{F}$ the umbral algebra. The umbral calculus is the study of umbral algebra.

The order $o(f(t))$ of power series $f(t)(\neq 0)$ is the smallest integer $k$ for which $a_{k}$ does not vanish. We define $o(f(t))=\infty$ if $f(t)=0$. From the definition of order, we note that $o(f(t) g(t))=o(f(t))+o(g(t))$ and $o(f(t)+g(t)) \geq \min \{o(f(t)), o(g(t))\}$.

The series $f(t)$ has a multiplicative inverse, denoted by $f(t)^{-1}$ or $1 / f(t)$, if and only if $o(f(t))=0$.

Such a series is called invertible series. A series $f(t)$ for which $o(f(t))=1$ is called a delta series (see $[7,8])$. Let $f(t), g(t) \in \mathbf{F}$. Then, we have

$$
\begin{equation*}
\langle f(t) g(t) \mid p(x)\rangle=\langle f(t) \mid g(t) p(x)\rangle=\langle g(t) \mid f(t) p(x)\rangle . \tag{1.7}
\end{equation*}
$$

By (1.5) and (1.6), we get

$$
\begin{equation*}
\left\langle e^{y t} \mid x^{n}\right\rangle=y^{n}, \quad\left\langle e^{y t} \mid p(x)\right\rangle=p(y) \tag{1.8}
\end{equation*}
$$

see [7].
Notice that for all $f(t)$ in $\mathbf{F}$,

$$
\begin{equation*}
f(t)=\sum_{k=0}^{\infty} \frac{\left\langle f(t) \mid x^{k}\right\rangle}{k!} t^{k} \tag{1.9}
\end{equation*}
$$

and for all polynomials $p(x)$,

$$
\begin{equation*}
p(x)=\sum_{k \geq 0} \frac{\left\langle t^{k} \mid p(x)\right\rangle}{k!} x^{k}, \tag{1.10}
\end{equation*}
$$

see $[7,8]$.
Let $f_{1}(t), f_{2}(t), \ldots, f_{m}(t) \in \mathbf{F}$. Then, we have

$$
\begin{equation*}
\left\langle f_{1}(t) f_{2}(t) \cdots f_{m}(t) \mid x^{n}\right\rangle=\sum\binom{n}{i_{1}, \ldots, i_{m}}\left\langle f_{1}(t) \mid x^{i_{1}}\right\rangle \cdots\left\langle f_{m}(t) \mid x^{i_{m}}\right\rangle \tag{1.11}
\end{equation*}
$$

where the sum is over all nonnegative integers $i_{1}, i_{2}, \ldots, i_{m}$ such that $i_{1}+\cdots+i_{m}=n$ (see [8]). By (1.10), we get

$$
\begin{equation*}
p^{(k)}(x)=\frac{d^{k} p(x)}{d x^{k}}=\sum_{l=k}^{n} \frac{\left\langle t^{l} \mid p(x)\right\rangle}{l!} l(l-1) \cdots(l-k+1) x^{l-k} . \tag{1.12}
\end{equation*}
$$

Thus, from (1.12), we have

$$
\begin{equation*}
p^{(k)}(0)=\left\langle t^{k} \mid p(x)\right\rangle=\left\langle 1 \mid p^{(k)}(x)\right\rangle \tag{1.13}
\end{equation*}
$$

see [7].
By (1.13), we get

$$
\begin{equation*}
t^{k} p(x)=p^{(k)}(x)=\frac{d^{k}(p(x))}{d x^{k}} \tag{1.14}
\end{equation*}
$$

Thus, by (1.14), we see that

$$
\begin{equation*}
e^{y t} p(x)=p(x+y) . \tag{1.15}
\end{equation*}
$$

Let us assume that $s_{n}(x)$ is a polynomial of degree $n$. Suppose that $f(t), g(t) \in \mathbf{F}$ with $o(f(t))=1$ and $o(g(t))=0$. Then, there exists a unique sequence $s_{n}(x)$ of polynomials satisfying $\left\langle g(t) f(t)^{k} \mid s_{n}(x)\right\rangle=n!\delta_{n, k}$ for all $n, k \geq 0$.

The sequence $s_{n}(x)$ is called the Sheffer sequence for $(g(t), f(t))$, which is denoted by $s_{n}(x) \sim(g(t), f(t))$.

The Sheffer sequence for $(g(t), t)$ is called the Appell sequence for $g(t)$, or $s_{n}(x)$ is Appell for $g(t)$, which is indicated by $s_{n}(x) \sim(g(t), t)$.

For $p(x) \in \mathbb{P}$, it is known that

$$
\begin{gather*}
\langle f(t) \mid x p(x)\rangle=\left\langle\partial_{t} f(t) \mid p(x)\right\rangle=\left\langle f^{\prime}(t) \mid p(x)\right\rangle \\
\left\langle e^{y t}-1 \mid p(x)\right\rangle=p(y)-p(0) \tag{1.16}
\end{gather*}
$$

see $[7,8]$.
Let $s_{n}(x) \sim(g(t), f(t))$. Then, we have

$$
\begin{gather*}
h(t)=\sum_{k=0}^{\infty} \frac{\left\langle h(t) \mid s_{k}(x)\right\rangle}{k!} g(t) f(t)^{k}, \quad h(t) \in \mathbf{F},  \tag{1.17}\\
p(x)=\sum_{k=0}^{\infty} \frac{\left\langle g(t) f(t)^{k} \mid p(x)\right\rangle}{k!} s_{k}(x), \quad p(x) \in \mathbb{P}  \tag{1.18}\\
\frac{1}{g(\bar{f}(t))} e^{y \bar{f}(t)}=\sum_{k=0}^{\infty} \frac{s_{k}(y)}{k!} t^{k}, \quad \text { for any } y \in \mathbf{C}_{p}, \tag{1.19}
\end{gather*}
$$

where $\bar{f}(t)$ is the compositional inverse of $f(t)$, and

$$
\begin{equation*}
f(t) S_{n}(x)=n s_{n-1}(x) \tag{1.20}
\end{equation*}
$$

see $[7,8]$.
We recall that the Bernoulli polynomials are defined by the generating function to be

$$
\begin{equation*}
\frac{t}{e^{t}-1} e^{x t}=e^{B(x) t}=\sum_{n=0}^{\infty} B_{n}(x) \frac{t^{n}}{n!} \tag{1.21}
\end{equation*}
$$

with the usual convention about replacing $B^{n}(x)$ by $B_{n}(x)$ (see [1-16]).
In the special case, $x=0, B_{n}(0)=B_{n}$ are called the $n$th Bernoulli numbers. By (1.21), we easily get

$$
\begin{equation*}
B_{n}(x)=(B+x)^{n}=\sum_{l=0}^{n}\binom{n}{l} B_{l} x^{n-l}=\sum_{l=0}^{n}\binom{n}{l} B_{n-l} x^{l} \tag{1.22}
\end{equation*}
$$

Thus, by (1.22), we see that $B_{n}(x)$ is a monic polynomial of degree $n$. It is easy to show that

$$
\begin{equation*}
B_{0}=1, \quad B_{n}(1)-B_{n}=\delta_{1, n}, \tag{1.23}
\end{equation*}
$$

see [13-15].
From (1.2), we can derive the following equation:

$$
\begin{equation*}
\int_{\mathrm{Z}_{p}} f(x+1) d \mu(x)-\int_{\mathrm{Z}_{p}} f(x) d \mu(x)=f^{\prime}(0) \tag{1.24}
\end{equation*}
$$

Let us take $f(x)=e^{t x} \in U D\left(\mathbf{Z}_{p}\right)$. Then, from (1.21), (1.22), (1.23), and (1.24), we have

$$
\begin{equation*}
\int_{\mathrm{Z}_{p}} x^{n} d \mu(x)=B_{n}, \quad \int_{\mathrm{Z}_{p}}(x+y)^{n} d \mu(y)=B_{n}(x) \tag{1.25}
\end{equation*}
$$

where $n \geq 0$ (see [1, 2]). Recently, Dere and simsek have studied applications of umbral algebra to some special functions (see [7]). In this paper, we investigate some properties of umbral calculus associated with $p$-adic invariant integrals on $\mathbf{Z}_{p}$. From our properties, we can derive some interesting identities of Bernoulli polynomials.

## 2. Applications of Umbral Calculus Associated with $p$-Adic Invariant Integrals on $Z_{p}$

Let $s_{n}(x)$ be an Appell sequence for $g(t)$. By (1.19), we get

$$
\begin{equation*}
\frac{1}{g(t)} x^{n}=s_{n}(x), \quad \text { iff } \quad x^{n}=g(t) s_{n}(x) \tag{2.1}
\end{equation*}
$$

Let us take $g(t)=\left(\left(e^{t}-1\right) / t\right) \in \mathbf{F}$. Then, $g(t)$ is clearly invertible series. From (1.21) and (2.1), we have

$$
\begin{equation*}
\sum_{k=0}^{\infty} \frac{B_{k}(x)}{k!} t^{k}=\frac{1}{g(t)} e^{x t} \tag{2.2}
\end{equation*}
$$

Thus, by (2.2), we get

$$
\begin{equation*}
\frac{1}{g(t)} x^{n}=B_{n}(x), \quad t B_{n}(x)=B_{n}^{\prime}(x)=n B_{n-1}(x), \quad(n \geq 0) \tag{2.3}
\end{equation*}
$$

From (1.21), (2.1), and (2.3), we note that $B_{n}(x)$ is an Appell sequence for $g(t)=\left(e^{t}-1\right) / t$.
Let us take the derivative with respect to $t$ on both sides of (2.2). Then, we have

$$
\begin{align*}
\sum_{k=1}^{\infty} \frac{B_{k}(x)}{k!} k t^{k-1} & =\frac{x g(t) e^{x t}-e^{x t} g^{\prime}(t)}{g(t)^{2}} \\
& =\sum_{k=0}^{\infty}\left\{x \frac{x^{k}}{g(t)}-\frac{x^{k}}{g(t)} \frac{g^{\prime}(t)}{g(t)}\right\} \frac{t^{k}}{k!} \tag{2.4}
\end{align*}
$$

Thus, by (2.4), we get

$$
\begin{equation*}
B_{k+1}(x)=x \frac{x^{k}}{g(t)}-\frac{x^{k}}{g(t)} \frac{g^{\prime}(t)}{g(t)}=\left(x-\frac{g^{\prime}(t)}{g(t)}\right) B_{k}(x) \tag{2.5}
\end{equation*}
$$

where $k \geq 0$.

$$
\begin{equation*}
\int_{\mathrm{Z}_{p}} e^{(x+y+1) t} d \mu(y)-\int_{\mathrm{Z}_{p}} e^{(x+y) t} d \mu(y)=t e^{x t} \tag{2.6}
\end{equation*}
$$

Thus, by (2.6), we get

$$
\begin{equation*}
\int_{\mathrm{Z}_{p}}(x+y+1)^{n} d \mu(y)-\int_{\mathrm{Z}_{p}}(x+y)^{n} \mu(y)=n x^{n-1}, \quad(n \geq 0) \tag{2.7}
\end{equation*}
$$

From (1.25) and (2.7), we have

$$
\begin{equation*}
B_{n}(x+1)-B_{n}(x)=n x^{n-1}, \quad(n \geq 0) \tag{2.8}
\end{equation*}
$$

By (2.5), we see that

$$
\begin{equation*}
g(t) B_{k+1}(x)=g(t) x B_{k}(x)-g^{\prime}(t) B_{k}(x), \tag{2.9}
\end{equation*}
$$

Thus, by (2.9), we have

$$
\begin{equation*}
\left(e^{t}-1\right) B_{k+1}(x)=\left(e^{t}-1\right) x B_{k}(x)-\left(e^{t}-g(t)\right) B_{k}(x), \quad(k \geq 0) \tag{2.10}
\end{equation*}
$$

and we can derive the following equation.
From (2.3) and (2.10),

$$
\begin{equation*}
B_{k+1}(x+1)-B_{k+1}(x)=(x+1) B_{k}(x+1)-x B_{k}(x)-B_{k}(x+1)+x^{k}, \quad(k \geq 0) \tag{2.11}
\end{equation*}
$$

By (2.8) and (2.11), we see that

$$
\begin{equation*}
B_{k+1}(x+1)=B_{k+1}(x)+(k+1) x^{k} . \tag{2.12}
\end{equation*}
$$

Therefore, by (2.5), we obtain the following theorem.
Theorem 2.1. For $k \in \mathbf{Z}_{+}$, one has

$$
\begin{equation*}
B_{k+1}(x)=\left(x-\frac{g^{\prime}(t)}{g(t)}\right) B_{k} \tag{2.13}
\end{equation*}
$$

where $g^{\prime}(t)=d g(t) / d t$.
Corollary 2.2. For $\geq 0$, one has

$$
\begin{equation*}
B_{k+1}(x+1)=B_{k+1}(x)+(k+1) x^{k} \tag{2.14}
\end{equation*}
$$

Let us consider the linear functional $f(t)$ that satisfies

$$
\begin{equation*}
\langle f(t) \mid p(x)\rangle=\int_{\mathbf{Z}_{p}} p(u) d \mu(u), \tag{2.15}
\end{equation*}
$$

for all polynomials $p(x)$. It can be determined from (1.9) that

$$
\begin{align*}
f(t) & =\sum_{k=0}^{\infty} \frac{\left\langle f(t) \mid x^{k}\right\rangle}{k!} t^{k}=\sum_{k=0}^{\infty} \int_{\mathbf{Z}_{p}} u^{k} d \mu(u) \frac{t^{k}}{k!}  \tag{2.16}\\
& =\int_{\mathbf{Z}_{p}} e^{u t} d \mu(u) .
\end{align*}
$$

By (1.24) and (2.16), we get

$$
\begin{equation*}
f(t)=\int_{\mathrm{Z}_{p}} e^{u t} d \mu(u)=\frac{t}{e^{t}-1} \tag{2.17}
\end{equation*}
$$

Therefore, by (2.17), we obtain the following theorem.
Theorem 2.3. For $p(x) \in \mathbf{P}$, one has

$$
\begin{equation*}
\left\langle\int_{Z_{p}} e^{u t} d \mu(u) \mid p(x)\right\rangle=\int_{Z_{p}} p(u) d \mu(u) . \tag{2.18}
\end{equation*}
$$

That is

$$
\begin{equation*}
\left\langle\left.\frac{t}{e^{t}-1} \right\rvert\, p(x)\right\rangle=\int_{\mathrm{Z}_{p}} p(u) d \mu(u) . \tag{2.19}
\end{equation*}
$$

In particular, one has

$$
\begin{equation*}
B_{n}=\left\langle\int_{Z_{p}} e^{u t} d \mu(u) \mid x^{n}\right\rangle . \tag{2.20}
\end{equation*}
$$

From (1.24), one has

$$
\begin{align*}
\sum_{n=0} \int_{\mathbf{Z}_{p}}(x+y)^{n} d \mu(y) \frac{t^{n}}{n!} & =\int_{Z_{p}} e^{(x+y) t} d \mu(y) \\
& =\sum_{n=0}^{\infty} \int_{\mathbf{Z}_{p}} e^{y t} d \mu(y) x^{n} \frac{t^{n}}{n!} . \tag{2.21}
\end{align*}
$$

By (1.25) and (2.21), we get

$$
\begin{equation*}
B_{n}(x)=\int_{\mathbf{Z}_{p}}(x+y)^{n} d \mu(y)=\int_{\mathbf{Z}_{p}} e^{y t} d \mu(y) x^{n} \tag{2.22}
\end{equation*}
$$

where $n \geq 0$.
Therefore, by (2.22), we obtain the following theorem.
Theorem 2.4. For $p(x) \in \mathbb{P}$, we have

$$
\begin{align*}
\int_{\mathbf{Z}_{p}} p(x+y) d \mu(y) & =\int_{\mathbf{Z}_{p}} e^{y t} d \mu(y) p(x)  \tag{2.23}\\
& =\frac{t}{e^{t}-1} p(x)
\end{align*}
$$

In particular, one obtains

$$
\begin{align*}
B_{n}(x) & =\int_{\mathbf{Z}_{p}}(x+y)^{n} d \mu(y)=\int_{\mathbf{Z}_{p}} e^{y t} d \mu(y) x^{n}  \tag{2.24}\\
& =\frac{t}{e^{t}-1} x^{n}
\end{align*}
$$

The higher order Bernoulli polynomials $B_{n}^{(r)}(x)$ are defined by

$$
\begin{align*}
\int_{\mathbf{Z}_{p}} \cdots \int_{\mathbf{Z}_{p}} e^{\left(x_{1}+x_{2}+\cdots+x_{r}+x\right) t} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) & =\left(\frac{t}{e^{t}-1}\right)^{r} e^{x t} \\
& =\sum_{n=0}^{\infty} B_{n}^{(r)}(x) \frac{t^{n}}{n!} \tag{2.25}
\end{align*}
$$

In the special case, $x=0, B_{n}^{(r)}(0)=B_{n}^{(r)}$ are called the $n$th Bernoulli numbers of order $r(\in \mathbf{N})$. From (2.25), we note that

$$
\begin{align*}
& \int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}}\left(x_{1}+\cdots+x_{r}\right)^{n} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) \\
& \quad= \sum_{i_{1}+\cdots+i_{r}=n}\binom{n}{i_{1}, \ldots, i_{r}} \int_{\mathrm{Z}_{p}} x_{1}^{i_{1}} d \mu\left(x_{1}\right) \int_{\mathbf{Z}_{p}} x_{2}^{i_{2}} d \mu\left(x_{2}\right) \cdots \int_{\mathbf{Z}_{p}} x_{r}^{i_{r}} d \mu\left(x_{r}\right)  \tag{2.26}\\
& \quad=\sum_{i_{1}+\cdots+i_{r}=n}\binom{n}{i_{1}, \ldots, i_{r}} B_{i_{1}} \cdots B_{i_{r}}=B_{n}^{(r)} .
\end{align*}
$$

By (2.25) and (2.26), we get

$$
\begin{equation*}
B_{n}^{(r)}(x)=\sum_{l=0}^{n}\binom{n}{l} B_{n-l}^{(r)} x^{l} \tag{2.27}
\end{equation*}
$$

From (2.26) and (2.27), we note that $B_{n}^{(r)}(x)$ is a monic polynomial of degree $n$ with coefficients in $\mathbf{Q}$. For $r \in \mathbf{N}$, let us assume that

$$
\begin{equation*}
g^{(r)}(t)=\left(\int_{\mathbf{Z}_{p}} \cdots \int_{\mathbf{Z}_{p}} e^{\left(x_{1}+\cdots+x_{r}\right) t} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right)\right)^{-1}=\left(\frac{e^{t}-1}{t}\right)^{r} \tag{2.28}
\end{equation*}
$$

By (2.28), we easily see that $g^{(r)}(t)$ is an invertible series. From (2.25) and (2.28), we have

$$
\begin{align*}
\frac{e^{x t}}{g^{(r)}(t)} & =\int_{\mathbf{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} e^{\left(x_{1}+\cdots+x_{r}+x\right) t} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) \\
& =\sum_{n=0}^{\infty} B_{n}^{(r)}(x) \frac{t^{n}}{n!^{\prime}}  \tag{2.29}\\
t B_{n}^{(r)}(x)= & n B_{n-1}^{(r)}(x) .
\end{align*}
$$

From (2.29), we note that $B_{n}^{(r)}$ is an Appell sequence for $g^{(r)}(t)$. Therefore, by (2.29), we obtain the following theorem.

Theorem 2.5. For $p(x) \in \mathbb{P}$ and $r \in \mathbf{N}$, one has

$$
\begin{equation*}
\int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} p\left(x_{1}+\cdots+x_{r}+x\right) d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right)=\left(\frac{t}{e^{t}-1}\right)^{r} p(x) . \tag{2.30}
\end{equation*}
$$

In particular, the Bernoulli polynomials of order $r$ are given by

$$
\begin{equation*}
B_{n}^{(r)}(x)=\left(\frac{t}{e^{t}-1}\right)^{r} x^{n}=\int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} e^{\left(x_{1}+\cdots+x_{r}\right) t} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) x^{n} . \tag{2.31}
\end{equation*}
$$

That is

$$
\begin{equation*}
B_{n}^{(r)}(x) \sim\left(\left(\frac{e^{t}-1}{t}\right)^{r}, t\right) . \tag{2.32}
\end{equation*}
$$

Let us consider the linear functional $f^{(r)}(t)$ that satisfies

$$
\begin{equation*}
\left\langle f^{(r)}(t) \mid p(x)\right\rangle=\int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} p\left(x_{1}+\cdots+x_{r}\right) d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) \tag{2.33}
\end{equation*}
$$

for all polynomials $p(x)$. It can be determined from (1.9) that

$$
\begin{align*}
f^{(r)}(t) & =\sum_{k=0}^{\infty} \frac{\left\langle f^{(r)}(t) \mid x^{k}\right\rangle}{k!} t^{k} \\
& =\sum_{k=0}^{\infty} \int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}}\left(x_{1}+\cdots+x_{r}\right)^{k} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) \frac{t^{k}}{k!}  \tag{2.34}\\
& =\int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} e^{\left(x_{1}+\cdots+x_{r}\right) t} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) \\
& =\left(\frac{t}{e^{t}-1}\right)^{r}
\end{align*}
$$

Therefore, by (2.34), we obtain the following theorem.
Theorem 2.6. For $p(x) \in \mathbb{P}$, one has

$$
\begin{align*}
& \left\langle\int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} e^{\left(x_{1}+\cdots+x_{r}\right) t} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) \mid p(x)\right\rangle  \tag{2.35}\\
& \quad=\int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} p\left(x_{1}+\cdots+x_{r}\right) d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right)
\end{align*}
$$

That is

$$
\begin{equation*}
\left\langle\left.\left(\frac{t}{e^{t}-1}\right)^{r} \right\rvert\, p(x)\right\rangle=\int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} p\left(x_{1}+\cdots+x_{r}\right) d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) . \tag{2.36}
\end{equation*}
$$

In particular, one gets

$$
\begin{equation*}
B_{n}^{(r)}=\left\langle\int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} e^{\left(x_{1}+\cdots+x_{r}\right) t} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) \mid x^{n}\right\rangle \tag{2.37}
\end{equation*}
$$

Remark 2.7. From (1.11), we note that

$$
\begin{align*}
& \left\langle\int_{\mathrm{Z}_{p}} \cdots \int_{\mathrm{Z}_{p}} e^{\left(x_{1}+\cdots+x_{r}\right) t} d \mu\left(x_{1}\right) \cdots d \mu\left(x_{r}\right) \mid x^{n}\right\rangle \\
& \quad=\sum_{n=i_{1}+\cdots+i_{r}}\binom{n}{i_{1}, \ldots, i_{r}}\left\langle\int_{\mathrm{Z}_{p}} e^{x_{1} t} d \mu\left(x_{1}\right) \mid x^{i_{1}}\right\rangle \cdots\left\langle\int_{\mathrm{Z}_{p}} e^{x_{r} t} d \mu\left(x_{r}\right) \mid x^{i_{r}}\right\rangle \tag{2.38}
\end{align*}
$$

By Theorems 2.3 and 2.6 and (2.38), we get

$$
\begin{equation*}
B_{n}^{(r)}=\sum_{n=i_{1}+\cdots+i_{r}}\binom{n}{i_{1}, \ldots, i_{r}} B_{i_{1}} \cdots B_{i_{r}} . \tag{2.39}
\end{equation*}
$$

Let $s_{n}(x)$ be the Sheffer sequence for $(g(t), f(t))$.

Then the Sheffer identity is given by

$$
\begin{equation*}
s_{n}(x+y)=\sum_{k=0}^{n}\binom{n}{k} p_{k}(y) s_{n-k}(x), \tag{2.40}
\end{equation*}
$$

see $[7,8]$, where $p_{k}(y)=g(t) s_{k}(y)$. From Theorem 2.5 and (2.40), we have

$$
\begin{equation*}
B_{n}^{(r)}(x+y)=\sum_{k=0}^{n}\binom{n}{k} B_{n-k}^{(r)}(x) x^{k} \tag{2.41}
\end{equation*}
$$
