

## ON THE STABLE CLASSIFICATION OF SPIN FOUR-MANIFOLDS

FULVIA SPAGGIARI

(Received February 27, 2002)

### 1. Introduction

The stable classification of closed connected topological respectively smooth four-manifolds (with orientation or spin structure) via bordism theory is a very nice result in topology of manifolds, and can be found in [11] and [23]. Here *stably* means that one allows additional connected sums with copies of  $\mathbb{S}^2 \times \mathbb{S}^2$  on both sides. In [19] the closed oriented 4-manifolds with finitely presentable fundamental group  $\pi$  were classified modulo connected sum with simply connected closed 4-manifolds. More precisely, the stable equivalence classes of these manifolds are bijective to the quotient  $H_4(B\pi; \mathbb{Z})/(\text{Aut } \pi)_*$  via the map  $M \rightarrow f_*[M]$ , where  $[M] \in H_4(M)$  is the fundamental class, and  $f: M \rightarrow B\pi$  is the classifying map for the universal covering of  $M$  (see [19, Theorem 1]). The proof of this theorem is based on some facts concerning the cobordism groups  $\Omega_4(M)$ ,  $\Omega_4(B\pi)$ , and  $\Omega_4$  (see for example [7] and [28]). Recently, this result has been extended to the non-orientable case in [18] at least for abelian fundamental groups.

The aim of the present paper is to study the stable classification of closed connected oriented spin smooth 4-manifolds by using techniques of Kervaire-Milnor surgery, as explained for example in [4], [5], [6], and [20]. Then we reproduce a nice result of Kurazono and Matumoto [19] for such manifolds under the assumption that the fundamental group is finitely presentable and has vanishing second and third homology with  $\mathbb{Z}_2$ -coefficients.

Let  $\mathcal{M}_\pi$  (resp.  $\mathcal{M}_\pi^{\text{Spin}}$ ) be the set of closed connected oriented smooth (resp. spin) 4-manifolds with finitely presentable fundamental group  $\pi$ , which are considered up to (resp. spin) stable equivalence. We say that two manifolds in  $\mathcal{M}_\pi$  (resp.  $\mathcal{M}_\pi^{\text{Spin}}$ ) are (resp. *spin*) *stably equivalent* if they become diffeomorphic (resp. spin preserving diffeomorphic) after taking connected sums with copies of  $\mathbb{S}^2 \times \mathbb{S}^2$  and  $\mathbb{S}^2 \times \mathbb{S}^2$  (resp.  $\mathbb{S}^2 \times \mathbb{S}^2$ ) on both sides. The first result of the paper is the following

---

Work performed under the auspices of the G.N.S.A.G.A. of the C.N.R. (National Research Council) of Italy and partially supported by the Ministero per la Ricerca Scientifica e Tecnologica of Italy within the projects “Proprietà Geometriche delle Varietà Reali e Complesse”.

**Theorem A.** *There are bijective maps*

$$c: \Omega_4(B\pi)/(\text{Aut } \pi)_* \rightarrow \mathcal{M}_\pi$$

and

$$c^{\text{Spin}}: \Omega_4^{\text{Spin}}(B\pi)/(\text{Aut } \pi)_* \rightarrow \mathcal{M}_\pi^{\text{Spin}}.$$

The inverse maps are given by sending  $\{M\} \in \mathcal{M}_\pi$  and  $\{M\}^{\text{Spin}} \in \mathcal{M}_\pi^{\text{Spin}}$  to  $\{(M, f)\} \in \Omega_4(B\pi)/(\text{Aut } \pi)_*$  and  $\{(M, \sigma_M, f)\} \in \Omega_4^{\text{Spin}}(B\pi)/(\text{Aut } \pi)_*$ , respectively. Here  $\sigma_M$  denotes the spin structure on  $M$ , and  $f: M \rightarrow B\pi$  is the classifying map.

The statement for the map  $c$  was proved in [19], while that for the map  $c^{\text{Spin}}$  follows from the results given in the next section. Then we can consider the Hurewicz homomorphisms

$$\mu: \Omega_4(B\pi) \rightarrow H_4(B\pi; \mathbb{Z})$$

and

$$\mu^{\text{Spin}}: \Omega_4^{\text{Spin}}(B\pi) \rightarrow H_4(B\pi; \mathbb{Z})$$

defined by the correspondences  $(M, f) \rightarrow f_*[M]$  and  $(M, \sigma_M, f) \rightarrow f_*[M]$ , respectively. By [11] and [19] the map  $\mu$  is surjective with kernel isomorphic to  $\mathbb{Z}$  and generated by  $\mathbb{C}P^2$ . So there is a decomposition

$$\Omega_4(B\pi) \cong \Omega_4 \oplus \widetilde{\Omega}_4(B\pi) \cong \mathbb{Z} \oplus H_4(B\pi; \mathbb{Z})$$

where  $\widetilde{\Omega}_4(B\pi) \cong H_4(B\pi; \mathbb{Z})$  is the cokernel of the monomorphism  $i: \Omega_4 \rightarrow \Omega_4(B\pi)$ , and the isomorphism  $\Omega_4 \cong \mathbb{Z}$  is given by the signature. In §3 we will prove that if  $H_2(B\pi; \mathbb{Z}_2) \cong H_3(B\pi; \mathbb{Z}_2) \cong 0$ , then the map  $\mu^{\text{Spin}}$  is surjective with kernel isomorphic to  $16\mathbb{Z}$  and generated by the Kummer surface  $K^4$ . The last result permits to obtain a stable decomposition theorem analogous to that proved in [19] for the class of spin smooth 4-manifolds whose fundamental group satisfies the above homological conditions. For this, we say that two closed connected oriented spin smooth 4-manifolds are *spin weakly stably equivalent* if they become spin preserving diffeomorphic after taking connected sums with copies of the Kummer surface  $K^4$  and  $\mathbb{S}^2 \times \mathbb{S}^2$ . Then the second result, we will prove, is the following

**Theorem B.** *Let  $\pi$  be a finitely presentable group which has vanishing second and third homology with  $\mathbb{Z}_2$ -coefficients. Then the spin weak stable equivalence classes of closed connected oriented spin smooth 4-manifolds  $M$  with fundamental group  $\pi$  one-to-one correspond with the elements of  $H_4(B\pi; \mathbb{Z})/(\text{Aut } \pi)_*$  via the map  $(M, \sigma_M, f) \rightarrow f_*[M]$ , where  $\sigma_M$  is the spin structure on  $M$ , and  $f: M \rightarrow B\pi$  is the*

classifying map. In particular, if  $f_*[M] = 0$ , then  $M$  is spin weakly stably equivalent to the boundary of the regular neighborhood of an embedded finite 2-complex, realizing  $\pi$ , in 5-space.

For the proof we treat with the spin cobordism groups  $\Omega_4^{\text{Spin}}(B\pi)$ . For the definition of spin cobordism groups we refer to [7] and [28]. A spin structure  $\sigma_M$  on a manifold  $M$  is best thought of as a choice of trivialization of the tangent bundle of  $M$  over the 2-skeleton [27].

The following corollary is related with some papers concerning the homotopy type and the stable classification of closed 4-manifolds with free fundamental group (see [2], [3], [13], [15], [16] and [17]).

**Corollary.** *Let  $M$  be a closed connected oriented spin smooth 4-manifold whose fundamental group  $\pi_1(M)$  is a free product  $G_1 * \dots * G_p$  such that  $H_2(BG_i; \mathbb{Z}_2) = H_3(BG_i; \mathbb{Z}_2) = 0$  for any  $i = 1, \dots, p$ . Then  $M \# lK^4 \# k(\mathbb{S}^2 \times \mathbb{S}^2)$  is spin preserving diffeomorphic to a connected sum  $M_1 \# \dots \# M_p$  of closed connected oriented spin smooth 4-manifolds  $M_i$  with  $\pi_1(M_i) \cong G_i$  for some non-negative integers  $l$  and  $k$ . The decomposition is spin stably unique.*

## 2. The map $c^{\text{Spin}}$

In this section we prove Theorem A for the class of closed connected spin smooth 4-manifolds with finitely presentable fundamental group  $\pi$ . We use only simple techniques of Kervaire-Milnor surgery (see for example [4], [5], [6], and [20]).

**Lemma 1.** *If  $\pi$  is finitely presented, any element  $\omega$  in  $\Omega_4^{\text{Spin}}(B\pi)$  gives a closed oriented spin smooth 4-manifold  $(N, \sigma_N)$  with  $\pi_1(N) \cong \pi$  and a map  $g: N \rightarrow B\pi$  such that  $g$  induces an isomorphism on  $\pi_1$  and  $[(N, \sigma_N, g)] = \omega$  in  $\Omega_4^{\text{Spin}}(B\pi)$ .*

*Proof.* The proof goes in the same way as that of Lemma 5 of [19]. We have only to keep the spin structures as in [4], [5], [6] and [20]. We can arrange that  $f$  induces an epimorphism on  $\pi_1$  by redefining  $M$  to be  $M \# k(\mathbb{S}^1 \times \mathbb{S}^3)$  and redefining  $f$  (we continue to use the same notation). It is easy to see that  $f$  extends in the desired way as does the spin structure, also denoted  $\sigma_M$  (see for example [6, Proposition 4.2]). Now perform surgery on embedded circles in  $\text{Int}M$  which represent elements of the kernel of  $f_*$  to get a new spin 4-manifold  $(N, \sigma_N)$  (see [25, Lemma 5]). Indeed,  $\sigma_M$  extends to a spin structure  $\sigma_N$  on the surgery manifold  $N$ . Since  $\pi$  is finitely presented, it is possible, by a finite number of surgeries, to obtain a closed oriented spin smooth 4-manifold  $(N, \sigma_N)$  and a map  $g: N \rightarrow B\pi$  which induces an isomorphism on  $\pi_1$ . Furthermore, we have  $[(N, \sigma_N, g)] = \omega$  in  $\Omega_4^{\text{Spin}}(B\pi)$  since  $k(\mathbb{S}^1 \times \mathbb{S}^3)$  represents the trivial class in  $\Omega_4^{\text{Spin}}(B\pi)$ . □

**Corollary 2.** *If the pairs  $(M, \sigma_M, f)$  and  $(N, \sigma_N, g)$  represent the same element of  $\Omega_4^{\text{Spin}}(B\pi)$  such that the induced maps on  $\pi_1$  are isomorphic, then there exist a compact oriented smooth cobordism  $(W, F)$  and a spin structure  $\sigma_W$  on  $W$  extending those on  $\partial W = M \cup (-N)$  such that both inclusions  $M \subset W$  and  $N \subset W$  induce isomorphisms on  $\pi_1$ .*

**Lemma 3.** *Let  $(W, \sigma_W, F)$  be a compact oriented smooth spin cobordism between  $(M, \sigma_M, f)$  and  $(N, \sigma_N, g)$  such that both inclusions  $M \subset W$  and  $N \subset W$  induce isomorphisms on  $\pi_1$ . Then  $M\#k(\mathbb{S}^2 \times \mathbb{S}^2)$  is spin preserving diffeomorphic to  $N\#h(\mathbb{S}^2 \times \mathbb{S}^2)$  for some non-negative integers  $k$  and  $h$ .*

*Proof.* We can simplify the handle decomposition of  $W$  relative to  $M$  so that it has only 2-handles and 3-handles as in the usual proof of s-cobordism theorem in higher dimension. Then the feet of 2-handles are isotopic to the trivial one because it should represent the zero element in  $\pi_1$  by the assumption. So the middle level manifold is a connected sum of  $M$  and some copies of  $\mathbb{S}^2 \times \mathbb{S}^2$  since the cobordism is spin. By thinking from the other direction, it is also spin preserving diffeomorphic to a connected sum of  $N$  and some copies of  $\mathbb{S}^2 \times \mathbb{S}^2$ . □

These results together imply that the map  $c^{\text{Spin}}$  is bijective, as claimed.

### 3. Spin cobordism group

Let  $(M, \sigma_M)$  be a closed connected oriented spin smooth 4-manifold with finite presentable fundamental group  $\pi$ . Then we have a map  $f: M \rightarrow B\pi$  from  $M$  to the classifying space  $B\pi$ . The map is unique up to homotopy if we fix the induced isomorphism on  $\pi$ . The map determines the oriented spin cobordism class  $[(M, \sigma_M, f)]$  in  $\Omega_4^{\text{Spin}}(B\pi)$ . On the other hand, any element  $\omega$  of  $\Omega_4^{\text{Spin}}(B\pi)$  gives a closed connected oriented spin smooth 4-manifold  $(N, \sigma_N)$  and a map  $g: N \rightarrow B\pi$  with  $g_*: \pi_1(N) \xrightarrow{\cong} \pi$  (see Lemma 1 in §2). The manifolds  $M$  and  $N$  will be shown to be spin weakly stably equivalent provided  $H_2(B\pi; \mathbb{Z}_2) \cong H_3(B\pi; \mathbb{Z}_2) \cong 0$ . For this we need some results which describe the properties of the Hurewicz homomorphism  $\mu^{\text{Spin}}$ .

**Lemma 4.** *Let  $X$  be a CW-complex such that  $H_2(X; \mathbb{Z}_2) = H_3(X; \mathbb{Z}_2) = 0$ . Then the map*

$$\mu^{\text{Spin}}: \Omega_4^{\text{Spin}}(X) \rightarrow H_4(X; \mathbb{Z}),$$

*defined by*

$$\mu^{\text{Spin}}[(M, \sigma_M, f)] = f_*[M],$$

is surjective and  $\text{Ker } \mu^{\text{Spin}} \cong \Omega_4^{\text{Spin}}$ . Moreover, the restriction of  $\mu^{\text{Spin}}$  on

$$\widetilde{\Omega}_4^{\text{Spin}}(X) = \text{Ker}(\Omega_4^{\text{Spin}}(X) \rightarrow \Omega_4^{\text{Spin}}(*))$$

is an isomorphism.

Proof. The Atiyah-Hirzebruch spectral sequence

$$E_{p,q}^2 : H_p(X; \Omega_q^{\text{Spin}}) \Rightarrow \Omega_{p+q}^{\text{Spin}}(X)$$

has vanishing  $E^2$  terms for  $p+q \leq 4$  except for  $E_{0,4}^2$  and  $E_{4,0}^2$ . In fact, recall that  $\Omega_n^{\text{Spin}}$  is  $\mathbb{Z}, \mathbb{Z}_2, \mathbb{Z}_2, 0,$  and  $\mathbb{Z}$  for  $n = 0, 1, 2, 3, 4$  (see [26]), and hence  $E_{3,1}^2 = H_3(X; \Omega_1^{\text{Spin}}), E_{2,2}^2 = H_2(X; \Omega_2^{\text{Spin}})$  and  $E_{1,3}^2 = H_1(X; \Omega_3^{\text{Spin}})$  vanish (under our hypothesis). In general,  $E_{p,q}^\infty \cong J_{p,q} / J_{p-1,q+1}$ , where

$$J_{p,q} = \text{Im}(\Omega_{p+q}^{\text{Spin}}(X^{(p)}, X^{(p-1)}) \rightarrow \Omega_{p+q}^{\text{Spin}}(X)).$$

Thus  $E_{0,4}^\infty$  is the image of the split monomorphism  $\Omega^{\text{Spin}}(*) \rightarrow \Omega_4^{\text{Spin}}(X)$  whose cokernel is  $E_{4,0}^\infty \subset H_4(X; \mathbb{Z})$ . By dimensional reasoning

$$d^r : E_{p,q}^r \rightarrow E_{p-r,q+r-1}^r$$

and by comparing with the spectral sequence for  $\Omega_{p+q}^{\text{Spin}}(*)$ , it follows that every element in  $E_{0,4}^2$  and  $E_{4,0}^2$  is a permanent cycle. So we have  $E_{4,0}^\infty = E_{4,0}^2 \cong H_4(X; \mathbb{Z})$  and  $E_{0,4}^\infty = E_{0,4}^2 \cong H_0(X; \mathbb{Z}) \cong \mathbb{Z} \cong \Omega_4^{\text{Spin}}(*)$ . Then we get the exact sequence

$$0 \longrightarrow E_{0,4}^2 \cong \Omega_4^{\text{Spin}}(*) \longrightarrow \Omega_4^{\text{Spin}}(X) \longrightarrow E_{4,0}^2 \cong H_4(X; \mathbb{Z}) \longrightarrow 0.$$

The map  $\mu^{\text{Spin}} : \Omega_n^{\text{Spin}}(X) \rightarrow H_n(X; \mathbb{Z})$  induces a map from the spectral sequence for  $\Omega_{p+q}^{\text{Spin}}(X)$  to the spectral sequence for  $H_{p+q}(X; \mathbb{Z})$  and coincides with the map  $\Omega_4^{\text{Spin}}(X) \rightarrow E_{4,0}^2 \cong H_4(X; \mathbb{Z})$  of the sequence above for  $n = 4$ . Finally, we note that the kernel of this map is  $E_{0,4}^2 \cong \Omega_4^{\text{Spin}} \cong \mathbb{Z}$ , which is generated by the Kummer surface  $K^4$ . □

**Corollary 5.** *If  $H_2(B\pi; \mathbb{Z}_2) = H_3(B\pi; \mathbb{Z}_2) = 0$ , then the map*

$$\mu^{\text{Spin}} : \Omega_4^{\text{Spin}}(B\pi) \rightarrow H_4(B\pi; \mathbb{Z})$$

*is an epimorphism, and  $\text{Ker } \mu^{\text{Spin}} \cong \Omega_4^{\text{Spin}}$  is generated by the Kummer surface. Then there is a decomposition*

$$\Omega_4^{\text{Spin}}(B\pi) \cong \Omega_4^{\text{Spin}} \oplus \widetilde{\Omega}_4^{\text{Spin}}(B\pi) \cong 16\mathbb{Z} \oplus H_4(B\pi; \mathbb{Z})$$

where  $\widetilde{\Omega}_4^{\text{Spin}}(B\pi) \cong H_4(B\pi; \mathbb{Z})$  denotes the cokernel of the split monomorphism

$$i^{\text{Spin}} : \Omega_4^{\text{Spin}} \rightarrow \Omega_4^{\text{Spin}}(B\pi),$$

and the isomorphism  $\Omega_4^{\text{Spin}} \cong 16\mathbb{Z}$  is given by the signature.

As a consequence of Corollary 5, we get the following useful results first proved in [5, Theorem 5.2] and [6, Proposition 5.1], respectively.

**Corollary 6.** *If  $H_2(B\pi; \mathbb{Z}_2) = H_3(B\pi; \mathbb{Z}_2) = 0$ , then an oriented spin cobordism class  $[(M, \sigma_M, f)]$  is zero in  $\Omega_4^{\text{Spin}}(B\pi)$  if and only if the signature of  $M$  vanishes, and  $f_*[M] = 0$  in  $H_4(B\pi; \mathbb{Z})$ .*

**Corollary 7.** *Suppose that  $H_2(B\pi; \mathbb{Z}_2) = H_3(B\pi; \mathbb{Z}_2) = 0$ . Then  $\widetilde{\Omega}_4^{\text{Spin}}(B\pi)$  is trivial if and only if  $H_4(B\pi; \mathbb{Z}) = 0$ .*

Now we are going to prove Theorem B. Let  $\pi$  be a finitely presented group which has vanishing second and third homology with  $\mathbb{Z}_2$ -coefficients. A closed connected oriented spin 4-manifold  $(M, \sigma_M)$  with fundamental group  $\pi$  carries a classifying map  $f: M \rightarrow B\pi$ . The triple  $(M, \sigma_M, f)$  determines an oriented spin cobordism class  $[(M, \sigma_M, f)]$  in  $\Omega_4^{\text{Spin}}(B\pi)$ , and an element  $\mu^{\text{Spin}}[(M, \sigma_M, f)] = f_*[M]$  in  $H_4(B\pi; \mathbb{Z})$ . Of course, spin weakly stably equivalent 4-manifolds determine the same element of  $H_4(B\pi; \mathbb{Z})/(\text{Aut } \pi)_*$ . Conversely, take any element of  $H_4(B\pi; \mathbb{Z})$ . Then it gives an element of

$$\widetilde{\Omega}_4^{\text{Spin}}(B\pi) = \text{Ker}(\Omega_4^{\text{Spin}}(B\pi) \rightarrow \Omega_4^{\text{Spin}}(*))$$

by Corollary 5. It comes from a closed connected spin smooth 4-manifold  $(N, \sigma_N)$  with  $\pi_1(N) \cong \pi$  and a map  $g: N \rightarrow B\pi$  by Lemma 1. Let  $(M, \sigma_M, f)$  be another triple with  $\pi_1(M) \cong \pi$  and a map  $f: M \rightarrow B\pi$  such that  $f_*[M] = g_*[N]$ . Then for some  $l$  and  $m$  we have

$$[(M \# l K^4, \sigma'_M, f')] = [(N \# m K^4, \sigma'_N, g')]$$

in  $\Omega_4^{\text{Spin}}(B\pi)$  by Corollary 5, and the fact that  $\Omega_4^{\text{Spin}}(*)$  is generated by the Kummer surface  $K^4$  (Here  $f'$  and  $g'$  are maps sending  $K^4$ 's to one point). Therefore the manifolds  $M$  and  $N$  are spin weakly stably equivalent by Corollary 2, and Lemma 3, i.e.  $M \# l K^4 \# k(\mathbb{S}^2 \times \mathbb{S}^2)$  is spin preserving diffeomorphic to  $N \# m K^4 \# h(\mathbb{S}^2 \times \mathbb{S}^2)$  for some  $l, m, h$  and  $k$ .

#### 4. Some applications

(1). If  $\pi$  is a free group of rank  $p$ , then  $B\pi \simeq \bigvee_p \mathbb{S}^1$ , so we get in particular  $H_i(B\pi; \mathbb{Z}_2) \cong 0$  for  $i = 2, 3$ , and  $H_4(B\pi; \mathbb{Z}) \cong 0$ . Thus we have  $\Omega_4^{\text{Spin}}(B\pi) \cong 16\mathbb{Z}$ ,

and the isomorphism is given by the signature. Theorem A implies that if  $M$  is a closed connected oriented spin 4-manifold with signature zero and  $\pi_1(M) \cong \pi$ , then  $M$  is spin stably homeomorphic to  $\#p(\mathbb{S}^1 \times \mathbb{S}^3)$  (see [2], [3], [13], and [15]). Theorem B says that a closed connected oriented spin 4-manifold  $M$  with  $\pi_1(M) \cong \pi$  becomes homeomorphic to  $\#p(\mathbb{S}^1 \times \mathbb{S}^3)$  after taking connected sums with copies of  $K^4$  and  $\mathbb{S}^2 \times \mathbb{S}^2$ . We recall that there exists a closed oriented topological 4-manifold with fundamental group  $\mathbb{Z}$  which is not the connected sum of  $\mathbb{S}^1 \times \mathbb{S}^3$  with a simply connected 4-manifold (see [12]).

(2). Let  $\pi$  be a group with a presentation of deficiency one which is an extension of  $\mathbb{Z}$  by a finitely generated normal subgroup. It was shown in [14] that the canonical 2-complex corresponding to that presentation is aspherical, hence  $\pi$  has geometric dimension at most 2. Furthermore, the Euler characteristic of  $B\pi$  vanishes. Suppose that  $H_1(B\pi; \mathbb{Z}_2) \cong \mathbb{Z}_2$  (examples are given by *knot like groups*, i.e., groups having abelianization  $\mathbb{Z}$  and deficiency one). Since  $\chi(B\pi) = 0$ , it follows that  $H_i(B\pi; \mathbb{Z}_2) = 0$  for  $i = 2, 3$ , and  $H_4(B\pi; \mathbb{Z}) = 0$ . Thus we obtain  $\Omega_4^{\text{Spin}}(B\pi) \cong 16\mathbb{Z}$ , as before. We recall that an algebraic characterization of certain 4-manifolds (called *exact manifolds*) with infinite cyclic first homology was given in nice recent papers of Kawachi (see [16] and [17]).

(3). If  $\pi \cong \mathbb{Z}_p \oplus \mathbb{Z}$  where  $p$  is a prime number,  $p > 2$ , then  $H_4(B\pi; \mathbb{Z}) \cong \mathbb{Z}_p$ . Since  $\text{Aut } \pi$  identifies all the non-zero elements of  $H_4(B\pi; \mathbb{Z})$ , we get that  $H_4(B\pi; \mathbb{Z})/(\text{Aut } \pi)_*$  is isomorphic to  $\mathbb{Z}_2$  (see [19]). Further, we have  $H_i(B\pi; \mathbb{Z}_2) \cong 0$  for  $i = 2, 3$ , hence  $\Omega_4^{\text{Spin}}(B\pi) \cong 16\mathbb{Z} \oplus \mathbb{Z}_p$ . Let  $Y^4$  be the boundary of a regular neighbourhood of an embedded finite 2-complex  $X^2$  realizing  $\pi$  in the standard 5-space. The induced homomorphism  $H_4(Y; \mathbb{Z}) \rightarrow H_4(B\pi; \mathbb{Z})$  is trivial since it factorizes through  $H_4(X; \mathbb{Z}) = 0$ . Thus  $[Y]$  goes to zero in  $H_4(B\pi; \mathbb{Z})/(\text{Aut } \pi)_* \cong \mathbb{Z}_2$ . Of course,  $Y^4$  is spin and has trivial signature since it embeds smoothly in  $\mathbb{R}^5$ . Let  $\Sigma_p$  be the product  $L(p, 1) \times \mathbb{S}^1$ , where  $L(p, 1)$  is the usual lens space. Then  $[\Sigma_p]$  goes to a nontrivial element of  $H_4(B\pi; \mathbb{Z})$ . Theorem B says that any closed connected oriented spin smooth 4-manifold  $M$  becomes spin stably equivalent to either  $\Sigma_p$  or  $Y^4$ .

(4). If  $\pi$  is a cyclic group  $\mathbb{Z}_p$  of odd order, then  $H_i(B\pi; \mathbb{Z}_2) = 0$  for  $i = 2, 3$ , and  $H_4(B\pi; \mathbb{Z}) = 0$ , hence  $\Omega_4^{\text{Spin}}(B\pi) \cong 16\mathbb{Z}$ . Let  $\bar{\Sigma}_p$  be the closed spin 4-manifold obtained from  $\Sigma_p$  by killing the generator of  $\mathbb{Z} \subset \pi_1(\Sigma_p) = \mathbb{Z}_p \oplus \mathbb{Z}$ . By Theorem B any closed connected oriented spin 4-manifold  $M$  with  $\pi_1(M) \cong \mathbb{Z}_p$  becomes diffeomorphic to  $\bar{\Sigma}_p$  after stabilization with copies of  $K^4$  and  $\mathbb{S}^2 \times \mathbb{S}^2$  (compare with Theorem 2.5 of [11]). Further examples of smooth 4-manifolds with cyclic fundamental groups were constructed in [8] by using the knot surgery construction.

(5). Let  $\pi$  be the fundamental group of a closed aspherical 4-manifold  $Q^4$  which is a rational homology 4-sphere. The existence of such a manifold was proved for example in [24]. If further  $H_2(B\pi; \mathbb{Z}_2) = 0$ , then the condition  $\chi(B\pi) = 2$  implies that the Betti numbers  $\beta_i$  vanish (mod 2) for  $i = 1, 3$ , hence  $H_3(B\pi; \mathbb{Z}_2) = 0$ . Of course, we also have  $H_4(B\pi; \mathbb{Z}) \cong \mathbb{Z}$ , hence  $H_4(B\pi; \mathbb{Z})/(\text{Aut } \pi)_*$  is isomorphic to either  $\mathbb{Z}$  or  $\mathbb{Z}/\{\pm 1\}$

(see [19]). Finally, we obtain  $\Omega_4^{\text{Spin}}(B\pi) \cong 16\mathbb{Z} \oplus \mathbb{Z}$ .

ACKNOWLEDGEMENT. The author wishes to thank the referee for his useful suggestions and remarks to improve this paper.
