

## CORRECTION

### ROBUSTNESS OF MULTIVARIATE TESTS

BY TAKEAKI KARIYA

*The Annals of Statistics* (1981) **9** 1267–1275

By providing a counterexample, Guorui, Jiagang and Yaoting (1987) pointed out an error in Theorem 1. A corrected version of the theorem and the proof are as follows. In the statement of Theorem 1, replace (ii) by:

(ii) When  $M = 0$  and when we write  $X = ZA$  with  $Z \in \mathcal{Z}$  and  $A \in \mathcal{S}(p)$  uniquely,  $\mathcal{L}_Z(t(ZA)) = \mathcal{L}(t(Z))$  for all  $A \in \mathcal{S}(p)$  and all  $\Sigma \in \mathcal{S}(p)$  where  $\mathcal{L}_Z(\cdot)$  denotes the distribution of  $\cdot$  with respect to  $Z$ .

The proof of sufficiency part is almost the same as the proof given since (ii) implies  $\mathcal{L}(t(X)) = \mathcal{L}(t(Z))$  for all  $\mathcal{L}(X) \in \mathcal{F}_L$ . In the proof of necessity part, replace the sentence "Taking  $C = A^{-1}$  in (2.10) ... produces (ii)" in the last part by the following sentences:

"Taking  $C = A^{-1}$  in (2.10) yields

$$(2.10a) \quad \mathcal{L}(t(Z)) = \mathcal{L}_Z(t(ZA))$$

a.e. (A). Since the completeness of  $\mathcal{N}$  implies that of  $\mathcal{F}_L$ , and since  $\mathcal{L}(Z)$  remains the same for all  $\mathcal{L}(X) \in \mathcal{F}_L$  by Lemma 1, (2.10a) holds a.e. (A) for all  $\mathcal{L}(X) = \mathcal{L}(ZA) \in \mathcal{F}_L$ . But for any given  $A \in \mathcal{S}(p)$ , there exists a distribution in  $\mathcal{F}_L$  which gives a positive mass to  $A$ . Hence (2.10a) must hold for all  $A \in \mathcal{S}(p)$ ."

We remark that Theorem 1 holds as it stands if  $\mathcal{F}_L$  is replaced by  $\tilde{\mathcal{F}}_L = \{\mathcal{L}(Z) \in \mathcal{F}_L \mid \mathcal{L}(X) \text{ has a pdf wrt Lebesgue measure}\}$ . Also Theorem 2 should be correspondingly modified.
