

# SUBGROUPS WITH TRIVIAL MAXIMAL INTERSECTION

BY  
STEVEN BAUMAN

In a group  $G$ , let  $\Phi(G)$  be the intersection of all maximal subgroups. If  $H \leq G$ , then it is clear that  $H \leq \Phi(G)$  if and only if  $H \leq M$  for every maximal subgroup  $M$  of  $G$ . It is well known that if  $G$  is finite then  $\Phi(G)$  is a nilpotent group. It follows that if  $H \cap M = H$  for all maximal subgroups  $M$  of a finite group  $G$ , then  $H$  is nilpotent. In this note we will consider a similar situation.

**DEFINITION.** A subgroup  $H$  of  $G$  is said to satisfy  $\mathcal{P}(G)$  if for any maximal subgroup  $M$  of  $G$  either  $H \cap M = H$  or  $H \cap M = \langle 1 \rangle$ .

It is proved in [1] that if  $G$  is finite and solvable then if  $H$  satisfies  $\mathcal{P}(G)$ ,  $H$  is nilpotent. In this note we provide more information about  $H$ . In particular, we say something of the embedding of  $H$  in  $G$  when  $H$  satisfies  $\mathcal{P}(G)$ .

All groups will be finite and most notations standard. We use  $M < \cdot G$  for  $M$  being a maximal subgroup of  $G$ .

**LEMMA 1.** Let  $K \leq H < G$  with  $H$  satisfying  $\mathcal{P}(G)$ . If  $N \triangleleft G$  then  $K$  satisfies  $\mathcal{P}(G)$  and  $HN/N$  satisfies  $\mathcal{P}(G/N)$ .

*Proof.* The statement about  $K$  is clear. Let  $M/N < \cdot G/N$ . Then Dedekind's theorem yields

$$\frac{HN}{N} \cap \frac{M}{N} = \frac{(H \cap M)N}{N}.$$

Since  $H$  satisfies  $\mathcal{P}(G)$  the result follows.

There are some particular situations where subgroups  $H$  satisfying  $\mathcal{P}(G)$  arise. For example, if  $H \leq \Phi(G)$  or  $H \leq N$  where  $N$  is a minimal normal subgroup of a solvable group  $G$ , then  $H$  satisfies  $\mathcal{P}(G)$ . Let  $G$  be a Frobenius group with kernel  $N$  and complement  $M$ . If  $N$  is minimal normal in  $G$  and  $H \leq \Phi(M)$ , then  $H$  is easily seen to satisfy  $\mathcal{P}(G)$ . Thus Frobenius actions sometimes give rise to subgroups satisfying  $\mathcal{P}(G)$ .

**DEFINITION.** A group  $H$  is said to be of Frobenius type if it has Sylow  $p$ -subgroups which are cyclic for  $p > 2$  and cyclic or generalized quaternion for  $p = 2$ .

**LEMMA 2.** Let  $H$  satisfy  $\mathcal{P}(G)$  in a solvable group  $G$ . If  $N$  is a minimal normal complemented subgroup of  $G$  with  $(|H|, |N|) = 1$ , then either

- (1)  $[H, N] = 1$  or
- (2)  $H$  is of Frobenius type.
