

CALIBRATING RANDOMNESS

ROD DOWNEY, DENIS R. HIRSCHFELDT, ANDRÉ NIES, AND SEBASTIAAN A. TERWIJN

CONTENTS

1. Introduction	412
2. Sets, measure, and martingales	414
2.1. Sets and measure	414
2.2. Martingales	415
3. Three approaches to randomness	416
3.1. The measure-theoretic paradigm	416
3.2. The unpredictability paradigm	417
3.3. The incompressibility paradigm	418
4. Solovay reducibility, and a characterization of 1-random left-c.e. reals	423
5. Other reducibilities that calibrate randomness	427
5.1. \leq_{sw} and \leq_{rK}	427
5.2. The basic measures \leq_K and \leq_C	429
5.3. Other ways to compare randomness	431
6. K -triviality, Post's Problem, and generalizing the Kučera-Slaman Theorem	431
6.1. K -trivial sets	431
6.2. K -trivial sets solve Post's Problem	435
7. Lowness for 1-randomness	436
8. Characterizing the K -trivial sets	440
9. Kummer complex c.e. sets, array noncomputability, and c.e.-traceability	447

Received September 13, 2005.

Downey's research was supported by the Marsden Fund of New Zealand.

Hirschfeldt's research was supported by the Marsden Fund of New Zealand and by National Science Foundation Grants DMS-02-00465 and DMS-05-00590.

Nies' research was supported by the Marsden Fund of New Zealand.

Terwijn's research was supported by the Austrian Research Fund (FWF grant P17503-N12).

We thank Joe Miller and the anonymous referee for useful comments on preliminary versions of this paper, and Peter Gács for clarifying certain historical points.
