#### ON THE FUNDAMENTAL THEOREM OF CALCULUS

Elaborating on the ideas of Henstock and Kurzweil, we define a well-behaved Riemann type integral in  $\mathbb{R}^m$  which is independent of the affine structure of  $\mathbb{R}^m$  and, consequently, is suitable for integrating on differentiable manifolds. The following version of the Fundamental Theorem of Calculus is proved.

**THEOREM** *Let  $M$  be a compact oriented  $m$ -dimensional  $C^1$  manifold with boundary  $\partial M$ , and let  $w$  be a continuous  $(m-1)$ -form on  $M$ . If  $w$  is differentiable in  $M - \partial M$ , then  $dw$  is integrable over  $M$  and*

$$\int_M dw = \int_{\partial M} w .$$
