A. Grothendieck developed in [1]* systematically the notion of fibre space on a topological space $X$ with structure sheaf $\mathcal{G}$, where $\mathcal{G}$ is any sheaf of groups, and the notion of 1-cohomology set $H^1(X, \mathcal{G})$ of $X$ with values in $\mathcal{G}$. He showed the important relation between the elements of $H^1(X, \mathcal{G})$ and the classes of fibre spaces on $X$ with structure sheaf $\mathcal{G}$. And he obtained the exact sequence of the cohomology sets (dim. 0 and 1) of $X$ with values in sheaves of groups on $X$.

A. Haefliger introduced in [2] the cohomology sets $H^0(X, \mathcal{G})$ and $H^1(X, \mathcal{G})$ of $X$ with values in a sheaf of groupoids $\mathcal{G}$ on $X$. And under the assumption that $\mathcal{G}$ is transitive, he proved that there exists a one-to-one correspondence between $H^1(X, \mathcal{G})$ and $H^1(X, \mathcal{G}^f)$, where $\mathcal{G}^f$ is the sheaf of groups associated to an element $f$ of $Z^1(\mathcal{U}, \mathcal{G})$.

In this paper, it is shown that we can obtain an exact sequence of the cohomology sets (dim. 0 and 1) of $X$ with values in sheaves of groupoids on $X$. We deal with the inverse problem of the relation between $\mathcal{G}$ and $\mathcal{G}^f$ which was shown by A. Haefliger: When a sheaf of groups $\mathcal{G}$ on $X$ is given, we may introduce a sheaf of transitive groupoids $\mathcal{G}$ on $X$ and an element $f$ of $Z^1(\mathcal{U}, \mathcal{G})$ such that we have a one-to-one correspondence $H^1(X, \mathcal{G}) \rightarrow H^1(X, \mathcal{G}^f)$ where the latter set can be identified with $H^1(X, \mathcal{G})$. And when the sheaf of transitive groupoids $\mathcal{G}$ has a unit section, it is shown that there exists a sheaf of groups $\mathcal{G}$, which is simpler than $\mathcal{G}^f$, such that $H^1(X, \mathcal{G})$ corresponds one-one to $H^1(X, \mathcal{G})$.

In the first half part, we prepare ourselves for treating the above-mentioned problems. In §1, we prove that two systems of axioms in the definition of groupoid—those in A. Haefliger's paper [2] and in P. Dedecker's [3]—are equivalent, and in §§2–3 we introduce the concept of normal subgroupoid and quotient groupoid. In §4, we refer to a representation of groupoid.

In the last half part, we solve the above-mentioned problems, applying the results in §§1–4 and introducing the concept of groupoid extension of a sheaf of groups.

§1. Axioms of groupoid.[2][3] A groupoid is a set $\mathcal{G}$ which has a composition law $(x, y) \rightarrow xy$, defined for some pairs of elements $x, y (\in \mathcal{G})$ and
