11. On the Series of Orthogonal Functions.

By Kien-Kwong CHEN.

Mathematical Institute, Tohoku Imp. University, Sendai.

Let $c_1, c_2, \ldots \ldots$ be a sequence of real numbers and $\varphi_1(x),\ \varphi_2(x), \ldots \ldots$ a sequence of normalized orthogonal functions in the interval $(0, 1)$; then relating to the series

$$(1) \qquad\qquad c_1\,\varphi_1(x) + c_2\,\varphi_2(x) + \ldots \ldots$$

we have the following theorems :

(A)   If the series $\sum (\log \nu)^2.\, c_\nu^2$ is convergent, the series (1) converges almost everywhere in the interval $(0, 1)$[1].

(B)   If the series $\sum (\log \log \nu)^2.\, c_\nu^2$ is convergent, the series (1) is C_1-summable almost everywhere in the interval $(0, 1)$[2].

The author proved that (A) and (B) are deducible from the following theorem, due to Borgen and Kaczmarz[2].

(C)   If the series $\sum (\log \log \nu)^2.\, c_\nu^2$ is convergent, the sequence of the partial sums

$$(2) \qquad s(x, 2),\ s(x, 2^2), \ldots \ldots, s(x, 2^n), \ldots \ldots$$

converges almost everywhere in the interval $(0, 1)$, where

$$s(x, p) = c_1\,\varphi_1(x) + c_2\,\varphi_2(x) + \ldots \ldots + c_p\,\varphi_p(x).$$

Conversely, it can be shown that the theorem (C) is deducible from (A), and also from (B).

Thus, we know that each of the theorems (A) and (B) is deducible from the other; i. e.

The theorems (A) *and* (B) *are equivalent.*

Corresponding to Lebesgue's constants in the theory of trigonometric series, we have for the system of normalized orthogonal functions $\varphi_1(x),\ \varphi_2(x), \ldots \ldots$, Lebesgue's functions
