

# Applied Dynamic Programming

By Richard Bellman and Stuart Dreyfus

Dynamic Programming has become more and more widely known and adopted as a valuable tool for the treatment of many challenging problems confronting decision-making agencies in the economic, industrial, scientific, and even political spheres of modern life. Not only graduate students in mathematics and economics, but also engineers and research workers in "operations analysis" will find interest in the book as it takes them into the computational aspects of applying the techniques of dynamic programming. *A RAND Corporation Research Study.*

400 pages. \$8.50

# Guide to Tables in Mathematical Statistics

By J. Arthur Greenwood and H. O. Hartley

This *Guide* catalogues a large selection of tables belonging to the field of mathematical statistics, the bulk of which were originally issued between 1900 and 1954, but some of which relate to works as early as 1799 and as late as 1960. As well as filling a need for those actively engaged in the computational side of mathematical statistics, this work offers valuable reference to the professional computer faced with a statistical problem and to the statistician called upon to compute.
