

point of  $ac$  with a point of  $b$  and join a point of  $ab$  with a point of  $c$ . Let  $x_1$  in  $ab$ ,  $x_2$  in  $ac$ , be the points where this line meets these spaces. The line then contains  $x$ ,  $x_1$ ,  $x_2$  all in  $a$ , where although  $x_1$  and  $x_2$  might coincide, neither could be  $x$ . But then the line would lie wholly in  $a$ , contrary to hypothesis. Hence  $x(ab+ac)=0$ , and (2) is established. Likewise  $y$  cannot be in  $ab+bc$ . For if it were then  $x+y$  would be in  $a+ab+bc=a+bc$ , contrary to hypothesis. Thus (4) is established, and (6) follows similarly. Hence for  $a$  to fail to be distributive in the second sense implies Case A. Conversely given Case A, then  $a$  fails to be distributive with respect to  $b$  and  $c$  in the second sense. Indeed  $y$  will then be in  $a+b$  and also in  $x+y$  which is in  $a+c$ . But  $y$  will not be in  $a+bc$ . For  $y$  is in  $b$ , but not in  $ab+bc$ , hence not in  $ab$  nor  $bc$ , hence not in  $a$  nor  $bc$ . If  $y$  were yet in  $a+bc$ , there would be a point  $u$  in  $a$ , and a point  $v$  in  $bc$  such that  $y$  would be in  $u+v$ . But  $y$  and  $v$  are then distinct and are both in  $b$ . Hence  $u+v$  is in  $b$ , and  $u$  is in  $b$ . Hence  $u$  is in  $ab$ . Hence  $y$  would be in  $ab+bc$  contrary to hypothesis. Hence Case A is a necessary and sufficient condition that  $a$  fail to be distributive with respect to  $b$  and  $c$  in the second sense.

Since Case B is necessary and sufficient for  $a$  to be distributive with respect to  $b$  and  $c$  in the first sense and again also in the second sense, Theorem 1 is proved. Since this Case B is symmetric in  $a$ ,  $b$ , and  $c$ , Theorem 2 is proved.

## ON FACTORING LARGE NUMBERS\*

BY D. H. LEHMER† AND R. E. POWERS

1. *Introduction.* Various non-tentative methods of factoring a given odd number  $N$ , based on the expansion of  $N^{1/2}$  in a regular continued fraction, have been described.‡ The success of most of these methods depends on the appearance of a perfect square among the denominators of the complete quotients. In practice, however, such an event occurs all too infrequently. More often
