

SETS OF LOCAL SEPARATING POINTS  
OF A CONTINUUM\*

BY G. T. WHYBURN

1. *Introduction.* Let  $M$  denote any locally compact metric continuum and let  $L$  be the set of all local separating points<sup>†</sup> of  $M$ . We proceed to establish the following six properties, of which, for our immediate purposes, the most useful is number (iv).

(i). *If  $U$  is any uncountable subset of  $L$ , there exists a point  $x$  of  $U$  which is a point of order 2 in  $M$  relative to  $U$ .*

This statement means that  $x$  is contained in arbitrarily small neighborhoods whose boundaries have in common with  $M$  just two points and these two points belong to  $U$ . A proof has already been given by the author (loc. cit.).

(ii). *If  $H$  is any connected subset of  $M$ , then  $(\overline{H} - H) \cdot L$  is countable.*

For if not, (i) would give a point  $x$  of this set which could be separated in  $M$  from some point of  $H$  by two points not in  $H$ , which obviously is impossible since  $H + x$  is connected.

(iii). *If  $H$  is any connected subset of  $M$ , the points of  $H \cdot L$  which are not local separating points of  $H$  are countable.*

This results immediately from (i).

(iv). *If  $H$  is any connected subset of  $M$  such that  $\overline{H} \subset L + C$ , where  $C$  is some countable set, then  $H$  is a locally connected  $G_\delta$ -set. Hence  $H$  is arcwise connected.*

By (ii) we see that  $(\overline{H} - H) \cdot L$  and hence  $\overline{H} - H$  itself is countable. Thus  $H$  is a  $G_\delta$ -set. Now  $\overline{H}$  must be a regular curve, for by (i), all save a countable number of its points are points of order 2. Thus any connected subset of  $\overline{H}$ , and in particular  $H$ , is locally connected. That  $H$  is arcwise connected follows now by the well known theorem of Moore-Menger.<sup>‡</sup>

† A point  $p$  is a local separating point of  $M$  provided some neighborhood  $V$  of  $p$  exists such that  $M \cdot \overline{V} - p$  is separated between some pair of points belonging to the component of  $M \cdot \overline{V}$  which contains  $p$ . See the author's paper in Monatshefte für Mathematik und Physik, vol. 36 (1929), pp. 305-314.
