of its derivative. Interesting contributions have been made to the 
theory of trigonometric integration, such as Verblunsky's approx­imate Denjoy integral and Burkill's Cesaro-Perron integral, in the 
intervening years between the author's original researches (1921) 
and the publication of this book, though there is no mention of them 
here.

Starting from de la Vallée-Poussin's result, the treatise covers all 
the ground that is necessary to reach the final result of the author. 
The fourth part, under review, comprises Chapters VII to IX, with 
a few Appendices at the end. In Chapter VII the author develops the 
theory of the Denjoy integral (totalisation simple) with the aid of a 
new notion of totalisation of series, presented here for the first time. 
In Chapter VIII he treats Stieltjes integrals relative to general meas­ures. In Chapter IX he presents a complete solution of the main 
problem, explained above, and illustrates with examples the impos­sibility of relaxing any of the conditions formulated in his definition 
of the "trigonometric integral." The Appendices deal mainly with the 
special Denjoy integral using majorants and minorants, besides con­taining a rather severe criticism of Perron's definition of integral on 
the ground that it is nonconstructive.

In contrast with the earlier notes of the author which were brief, 
the present work is very elaborate and even diffuse. It bears witness 
to the highly ingenious and original mind of the author. To appreci­ate it, one has to read the book in full; no part of it can be detached 
from the rest. This, however, is not an unmixed blessing. Though the 
title of the book sounds very special, its content is not narrow; it is 
really a survey, in the singular fashion of the author, of the various 
sectors of the theory of functions of a real variable that surround the 
very difficult problem of the calculation of coefficients of trigono­metrical series. The work that is embodied in this book has already had 
considerable influence on that of other mathematicians; in this sense, 
one regrets that the book did not appear sooner. Anyone interested 
in the theory of non-absolutely convergent integrals would consider 
the book valuable.

K. Chandrasekharan

*Lectures on classical differential geometry.* By D. J. Struik. Cambridge, 
Addison-Wesley, 1950. 8 + 221 pp. $6.00.

There is many a good reason to welcome this new book on differ­ential geometry.

First of all, there is the very fact that it is devoted to *classical* 
differential geometry, that is, to the wealth of ideas from which all 
further developments have been derived. The comprehensive his-
