SOLUTION OF A PROBLEM RAISED BY RUBEL

BY Y. KATZNELSON¹

The following problem was raised by L. Rubel in the 1950s and appears in [2]; my interest in it was rekindled by a query that B. Ghusayni submitted to the Notices of the American Mathematical Society.

PROBLEM. Suppose $E \neq \{0\}$ is a linear subspace of $L^2(\mathbf{R})$ such that

(i) $f \in E \Rightarrow \widehat{f} \in E$ (where \widehat{f} is the Fourier transform of f)

(ii) $g \in L^2(\mathbf{R})$, $|g| \leq |f|$ a.e. for some $f \in E$ implies that $g \in E$.

Then must $E = L^2(\mathbf{R})$?

We propose to prove more, namely:

THEOREM 1. Let $g, f \in L^2(\mathbf{R})$, $f \neq 0$. Then there exist functions $\varphi_j \in L^\infty(\mathbf{R})$, $j = 1, \dots, 5$ such that, denoting by M_j the operator of multiplication by φ_j and by F the Fourier transformation, we have

$$g = M_5 F M_4 F M_3 F M_2 F M_1 \cdot f.$$

NOTATIONS.

$$l^{2^*} = \{h; h \in L^2(\mathbf{R}), h \text{ constant in each } [n, n+1)\},$$

$$L^{2^*} = \{H; |H(x)| \leq h(x) \text{ for some } h \in l^{2^*}\},$$

$$= \{H; H = \varphi h, h \in l^{2^*}, \varphi \in L^\infty(\mathbf{R})\},$$

$$= \{H; \Sigma \sup_{n \leq x < n+1} |H(x)|^2 = |||H|||^2 < \infty\}.$$

LEMMA 1. If $\psi \in L^2(\mathbf{R})$ and $\text{support}(\psi) \subset [0, 1]$, then $\widehat{\psi} = F\psi \in L^{2^*}$ and $|||\widehat{\psi}||| \leq 2\|\psi\|$.

LEMMA 2. If $\Psi \in L^2(\mathbf{R})$, then there exists a continuous Φ , $|\Phi(x)| = 1$, such that $(\Phi\Psi)^\wedge \in L^{2^*}$ and $|||\Phi\Psi^\wedge||| \leq 2\|\Psi\|$.

PROOF. Write $\Psi = \Sigma\psi_j$ with $\psi_j = \Psi$ on I_j , where $\{I_j\}$ are intervals of length 1 whose disjoint union covers \mathbf{R} . Write $\Phi(x) = \exp\{i\lambda_j x\}$ on I_j ,
