This book represents an unusual attempt to publicize the field of Complex Dynamics. The editors report on this rapidly develop-
ing discipline in terms of computer graphical pictures that resulted from their own studies of iterated maps. Such maps arise, e.g.,
in the problem of root finding, or in the renormalization group theory of phase transitions. They define highly complex bound-
aries between various domains of attraction, also known as Julia sets for rational maps of the complex plane. Detailed investigation
into the changes of these boundaries under parameter variations reveals that Mandelbrot's set embodies an universal principle
of their morphology.
