

N. Straumann, University of Zurich

General Relativity and Relativistic Astrophysics

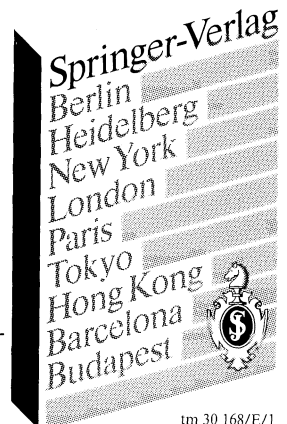

1991. XIII, 459 pp.
81 figs. (Texts and
Monographs in
Physics) Softcover
DM 72,-
ISBN 3-540-53743-0

This study edition of Straumann's well-known textbook is intended for students in physics, astrophysics, and mathematics. It concentrates on the physical content of Einstein's famous theory. The mathematical background of modern differential geometry is kept to a minimum and serves mainly as a reference for the reader unfamiliar with Cartan's coordinate-free calculus, which is used throughout the book. The author discusses in detail the equivalence principle and the field equations together with their experimental support by very recent observations. The last part covers much ground in modern astrophysics. It carefully analyses the Kerr-Newman-solutions, gravitational collapse, the cooling of neutron stars, radio sources, and black holes. The book should become a standard text for a modern treatment of the problems of gravitation.
