#### Abstract

We investigate the complete moment convergence of double-indexed weighted sums of martingale differences. Then it is easy to obtain the Marcinkiewicz-Zygmund-type strong law of large numbers of double-indexed weighted sums of martingale differences. Moreover, the convergence of double-indexed weighted sums of martingale differences is presented in mean square. On the other hand, we give the application to study the convergence of the state observers of linear-time-invariant systems and present the convergence with probability one and in mean square.

## 1. Introduction

Hsu and Robbins [1] introduced the concept of complete convergence; that is, a sequence of random variables $\left\{X_{n}, n \geq\right.$ $1\}$ is said to converge completely to a constant $C$ if $\sum_{n=1}^{\infty} P\left(\mid X_{n}-\right.$ $C \mid \geq \varepsilon)<\infty$ for all $\varepsilon>0$. By Borel-Cantelli lemma, it follows that $X_{n} \rightarrow C$ almost surely (a.s.). The converse is true if $\left\{X_{n}, n \geq 1\right\}$ is independent. But the converse cannot always be true for the dependent case. Hsu and Robbins [1] obtained that the sequence of arithmetic means of independent and identically distributed (i.i.d.) random variables converges completely to the expected value if the variance of the summands is finite. Erdös [2] proved the converse. The result of Hsu-Robbins-Erdös is a fundamental theorem in probability theory, and it has been generalized and extended in several directions by many authors. Baum and Katz [3] gave the following generalization to establish a rate of convergence in the sense of Marcinkiewicz-Zygmund-type strong law of large numbers.

Theorem 1. Let $\alpha>1 / 2, \alpha p>1$, and $\left\{X_{n}, n \geq 1\right\}$ be a sequence of i.i.d. random variables. Assume that $E X_{1}=0$ if $\alpha \leq 1$. Then the following statements are equivalent:
(i) $E\left|X_{1}\right|^{p}<\infty$;
(ii) $\sum_{n=1}^{\infty} n^{\alpha p-2} P\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} X_{i}\right|>\varepsilon n^{\alpha}\right)<\infty$ for all $\varepsilon>0$.

Many authors have extended Theorem 1 to the martingale differences. For example, Yu [4] obtained the complete convergence for weighted sums of martingale differences; Ghosal and Chandra [5] gave the complete convergence of martingale arrays; Stoica [6, 7] investigated the Baum-Katz-Nagaev-type results for martingale differences and the rate of convergence in the strong law of large numbers for martingale differences; Wang et al. [8] also studied the complete convergence and complete moment convergence for martingale differences, which generalized some results of Stoica [6, 7]; Yang et al. [9] obtained the complete convergence for the moving average process of martingale differences and so forth. For other works about convergence analysis, one can refer to Gut [10], Chen et al. [11], Sung [12-14], Sung and Volodin [15], Hu et al. [16], and the references therein.

In this paper, we study the moment complete convergence of double-indexed weighted sums of martingale differences. Then it is easy to obtain the Marcinkiewicz-Zygmund-type strong law of large numbers of double-indexed weighted sums of martingale differences. Moreover, the convergence of double-indexed weighted sums of martingale differences is presented in mean square. For the details, see Theorem 5, Corollary 6, and Theorem 7 in Section 2. On the other hand, we give the applications of Corollary 6 and Theorem 7 to study the convergence of the state observers of linear-time-invariant systems and present their convergence with
probability one and in mean square, respectively (see Theorems 11 and 12 in Section 3).

Recall that the sequence $\left\{X_{n}, n \geq 1\right\}$ is stochastically dominated by a nonnegative random variable $X$ if $\sup _{n \geq 1} P\left(\left|X_{n}\right|>t\right) \leq K P(X>t)$ for some positive constant $K$ and for all $t \geq 0$.

Throughout the paper, let $\mathscr{F}_{0}=\{\emptyset, \Omega\}, \mathbb{1}(B)$ be the indicator function of set $B x^{+}=x \mathbb{\rrbracket}(x \geq 0)$, and let $K, K_{1}, K_{2}, \ldots$ denote some positive constants not depending on $n$, which may be different in various places.

The following lemmas are useful for the proofs of the main results.

Lemma 2 (cf. Hall and Heyde [17, Theorem 2.11]). If $\left\{X_{i}, \mathscr{F}_{i}, 1 \leq i \leq n\right\}$ are martingale differences and $p>0$, then there exists a constant $K$ depending only on $p$ such that

$$
\begin{aligned}
& E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} X_{i}\right|^{p}\right) \\
& \quad \leq K\left\{E\left(\sum_{i=1}^{n} E\left(X_{i}^{2} \mid \mathscr{F}_{i-1}\right)\right)^{p / 2}+E\left(\max _{1 \leq i \leq n}\left|X_{i}\right|^{p}\right)\right\},
\end{aligned}
$$

$$
\begin{equation*}
n \geq 1 \tag{1}
\end{equation*}
$$

Lemma 3 (cf. Sung [12, Lemma 2.4]). Let $\left\{X_{n}, n \geq 1\right\}$ and $\left\{Y_{n}, n \geq 1\right\}$ be sequences of random variables. Then for any $n \geq 1, q>1, \varepsilon>0$, and $a>0$, one has

$$
\begin{align*}
& E\left(\max _{1 \leq j \leq n}\left|\sum_{i=1}^{j}\left(X_{i}+Y_{i}\right)\right|-\varepsilon a\right)^{+} \\
& \quad \leq\left(\frac{1}{\varepsilon^{q}}+\frac{1}{q-1}\right) \frac{1}{a^{q-1}} E\left(\max _{1 \leq j \leq n}\left|\sum_{i=1}^{j} X_{i}\right|^{q}\right)  \tag{2}\\
& \quad+E\left(\max _{1 \leq j \leq n}^{q}\left|\sum_{i=1}^{j} Y_{i}\right|\right)
\end{align*}
$$

Lemma 4 (cf. Wang et al. [8, Lemma 2.2]). Let $\left\{X_{n}, n \geq 1\right\}$ be a sequence of random variables stochastically dominated by a nonnegative random variable $X$. Then for any $n \geq 1, a>0$, and $b>0$, the following two statements hold:

$$
\begin{align*}
& E\left[\left|X_{n}\right|^{a} \mathbb{1}\left(\left|X_{n}\right| \leq b\right)\right] \\
& \quad \leq K_{1}\left\{E\left[X^{a} \mathbb{1}(X \leq b)\right]+b^{a} P(X>b)\right\},  \tag{3}\\
& E\left[\left|X_{n}\right|^{a} \mathbb{1}\left(\left|X_{n}\right|>b\right)\right] \leq K_{2} E\left[X^{a} \mathbb{1}(X>b)\right] .
\end{align*}
$$

Consequently, $E\left|X_{n}\right|^{a} \leq K_{3} E X^{a}$. Here $K_{1}, K_{2}$, and $K_{3}$ are positive constants.

## 2. The Convergence of Double-Indexed Weighted Sums of Martingale Differences

First, we give the complete moment convergence of doubleindexed weighted sums of martingale differences.

Theorem 5. Let $\alpha>1 / 2, p \geq 2$, and $\left\{X_{n}, \mathscr{F}_{n}, n \geq 1\right\}$ be martingale differences stochastically dominated by a nonnegative random variable $X$ with $E X^{p}<\infty$. Let $\left\{a_{n i}, 1 \leq i \leq n\right.$, $n \geq 1\}$ be a triangular array of real numbers. For some $q>$ $2(\alpha p-1) /(2 \alpha-1)$, we assume that $E\left[\sup _{n \geq 1} E\left(X_{n}^{2} \mid \mathscr{F}_{n-1}\right)\right]^{q / 2}<$ $\infty$ and

$$
\begin{equation*}
\sum_{i=1}^{n}\left|a_{n i}\right|^{q}=O(n) \tag{4}
\end{equation*}
$$

Then for every $\varepsilon>0$,

$$
\begin{equation*}
\sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} X_{i}\right|-\varepsilon n^{\alpha}\right)^{+}<\infty \tag{5}
\end{equation*}
$$

Taking $p=2 l$ and $\alpha=2 / p$ for $1 \leq l<2$ in Theorem 5, we have the following result.

Corollary 6. Let $1 \leq l<2,\left\{X_{n}, \mathscr{F}_{n}, n \geq 1\right\}$ be martingale differences stochastically dominated by a nonnegative random variable $X$ with $E X^{2 l}<\infty$. Let $\left\{a_{n i}, 1 \leq i \leq n, n \geq 1\right\}$ be a triangular array of real numbers. For some $q>2 l /(2-l)$, one assumes that $E\left[\sup _{n \geq 1} E\left(X_{n}^{2} \mid \mathscr{F}_{n-1}\right)\right]^{q / 2}<\infty$ and (4) holds true. Then for every $\varepsilon>0$,

$$
\begin{equation*}
\sum_{n=1}^{\infty} n^{-1 / l} E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} X_{i}\right|-\varepsilon n^{1 / l}\right)^{+}<\infty \tag{6}
\end{equation*}
$$

In particular, one has

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \frac{1}{n^{1 / l}} \sum_{i=1}^{n} a_{n i} X_{i}=0, \quad \text { a.s. } \tag{7}
\end{equation*}
$$

Next, we investigate the convergence in mean square.
Theorem 7. Let $r>1 / 2$ and $\left\{X_{n}, \mathscr{F}_{n}, n \geq 1\right\}$ be martingale differences stochastically dominated by a nonnegative random variable $X$ with $E X^{2}<\infty$. Let $\left\{a_{n i}, 1 \leq i \leq n, n \geq 1\right\}$ be a triangular array of real numbers and

$$
\begin{equation*}
\sum_{i=1}^{n} a_{n i}^{2}=O(n) \tag{8}
\end{equation*}
$$

Then, one has

$$
\begin{equation*}
n^{2 r-1} E\left(\frac{1}{n^{r}} \sum_{i=1}^{n} a_{n i} X_{i}\right)^{2} \leq K, \quad n \geq 1 \tag{9}
\end{equation*}
$$

where $K$ is a positive constant.
Remark 8. Wang et al. [8] obtained the complete convergence and complete moment convergence for nonweighted martingale differences, which generalized some results of Stoica [6, 7]. In this paper, we study the complete moment convergence of double-indexed weighted sums of martingale differences. So we extend the results of Wang et al. [8] and Stoica [6, 7] to the case of double-indexed weighted sums of martingale differences. On the other hand, we give the applications of

Corollary 6 and Theorem 7 to study the convergence of the state observers of linear-time-invariant systems and present the convergence with probability one and in mean square, respectively (see Theorems 11 and 12 in Section 3).

Proof of Theorem 5. Let $X_{n i}=X_{i} \mathbb{1}\left(\left|X_{i}\right| \leq n^{\alpha}\right), 1 \leq i \leq n$. It can be found that $a_{n i} X_{i}=a_{n i} X_{i} \mathbb{1}\left(\left|X_{i}\right|>n^{\alpha}\right)+\left[a_{n i} X_{n i}-\right.$ $\left.a_{n i} E\left(X_{n i} \mid \mathscr{F}_{i-1}\right)\right]+a_{n i} E\left(X_{n i} \mid \mathscr{F}_{i-1}\right), 1 \leq i \leq n$.

By Lemma 3 with $a=n^{\alpha}$, for any $q>1$, we obtain that

$$
\begin{align*}
& \sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} X_{i}\right|-\varepsilon n^{\alpha}\right)^{+} \\
& \leq \\
& \quad K_{1} \sum_{n=1}^{\infty} n^{\alpha p-2-q \alpha}  \tag{10}\\
& \quad \times E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k}\left[a_{n i} X_{n i}-a_{n i} E\left(X_{n i} \mid \mathscr{F}_{i-1}\right)\right]\right|^{q}\right) \\
& \quad+\sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} X_{i} \mathbb{1}\left(\left|X_{i}\right|>n^{\alpha}\right)\right|\right) \\
& \quad+\sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} E\left(X_{n i} \mid \mathscr{F}_{i-1}\right)\right|\right) \\
& := \\
& H_{1}+H_{2}+H_{3} .
\end{align*}
$$

For $p \geq 2$, it is easy to see that $q>2(\alpha p-1) /(2 \alpha-1) \geq 2$. Consequently, for any $1 \leq s \leq 2$, we get by Hölder's inequality and (4) that

$$
\begin{equation*}
\sum_{i=1}^{n}\left|a_{n i}\right|^{s} \leq\left(\sum_{i=1}^{n}\left|a_{n i}\right|^{q}\right)^{s / q}\left(\sum_{i=1}^{n} 1\right)^{1-s / q}=O(n) \tag{11}
\end{equation*}
$$

So, it can be checked by Markov's inequality, Lemma 4, (11), and $E X^{p}<\infty(p \geq 2)$ that

$$
\begin{aligned}
H_{2} & \leq \sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} \sum_{i=1}^{n}\left|a_{n i}\right| E\left[\left|X_{i}\right| \mathbb{1}\left(\left|X_{i}\right|>n^{\alpha}\right)\right] \\
& \leq K_{1} \sum_{n=1}^{\infty} n^{\alpha p-1-\alpha} E\left[X \mathbb{1}\left(X>n^{\alpha}\right)\right] \\
& =K_{1} \sum_{n=1}^{\infty} n^{\alpha p-1-\alpha} \sum_{m=n}^{\infty} E\left[X \mathbb{1}\left(m^{\alpha}<X \leq(m+1)^{\alpha}\right)\right] \\
& =K_{1} \sum_{m=1}^{\infty} E\left[X \mathbb{1}\left(m^{\alpha}<X \leq(m+1)^{\alpha}\right)\right] \sum_{n=1}^{m} n^{\alpha p-1-\alpha} \\
& \leq K_{2} \sum_{m=1}^{\infty} m^{\alpha p-\alpha} E\left[X \mathbb{1}\left(m^{\alpha}<X \leq(m+1)^{\alpha}\right)\right] \\
& \leq K_{2} E X^{p}<\infty .
\end{aligned}
$$

Since $\left\{X_{i}, \mathscr{F}_{i}, 1 \leq i \leq n\right\}$ are martingale differences, by the martingale property and the proof of (12), one has that

$$
\begin{align*}
H_{3} & =\sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} E\left[X_{i} \mathbb{1}\left(\left|X_{i}\right| \leq n^{\alpha}\right) \mid \mathscr{F}_{i-1}\right]\right|\right) \\
& =\sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} E\left[X_{i} \mathbb{1}\left(\left|X_{i}\right|>n^{\alpha}\right) \mid \mathscr{F}_{i-1}\right]\right|\right) \\
& \leq K_{1} \sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} \sum_{i=1}^{n}\left|a_{n i}\right| E\left[\left|X_{i}\right| \mathbb{1}\left(\left|X_{i}\right|>n^{\alpha}\right)\right] \\
& \leq K_{2} \sum_{n=1}^{\infty} n^{\alpha p-1-\alpha} E\left[X \mathbb{1}\left(X>n^{\alpha}\right)\right] \leq K_{3} E X^{p}<\infty . \tag{13}
\end{align*}
$$

Next, we turn to prove $H_{1}<\infty$ under conditions of Theorem 5. It can be seen that

$$
\begin{equation*}
\left\{\left[a_{n i} X_{n i}-a_{n i} E\left(X_{n i} \mid \mathscr{F}_{i-1}\right)\right], \mathscr{F}_{i}, 1 \leq i \leq n\right\} \tag{14}
\end{equation*}
$$

are also martingale differences. So, by Markov's inequality, (10), and Lemma 2 with $p=q$, it can be found that

$$
\left.\left.\begin{array}{rl}
H_{1}= & K_{1} \sum_{n=1}^{\infty} n^{\alpha p-2-q \alpha} E\left(\max _{1 \leq k \leq n} \mid \sum_{i=1}^{k}\right.
\end{array}\right] a_{n i} X_{n i}-a_{n i} E\right) .
$$

Obviously, it follows that

$$
\begin{align*}
E\{[ & {\left.\left[a_{n i} X_{n i}-E\left(a_{n i} X_{n i} \mid \mathscr{F}_{i-1}\right)\right]^{2} \mid \mathscr{F}_{i-1}\right\} } \\
& =E\left[a_{n i}^{2} X_{i}^{2} \mathbb{1}\left(\left|X_{i}\right| \leq n^{\alpha}\right) \mid \mathscr{F}_{i-1}\right] \\
& \quad-\left[E\left(a_{n i} X_{i} \mathbb{1}\left(\left|X_{i}\right| \leq n^{\alpha}\right) \mid \mathscr{F}_{i-1}\right)\right]^{2}  \tag{16}\\
& \leq a_{n i}^{2} E\left[X_{i}^{2} \mathbb{1}\left(\left|X_{i}\right| \leq n^{\alpha}\right) \mid \mathscr{F}_{i-1}\right] \\
& \leq a_{n i}^{2} E\left(X_{i}^{2} \mid \mathscr{F}_{i-1}\right), \quad \text { a.s., } 1 \leq i \leq n .
\end{align*}
$$

Combining (11) with $E\left[\sup _{i \geq 1} E\left(X_{i}^{2} \mid \mathscr{F}_{i-1}\right)\right]^{q / 2}<\infty$, we obtain that

$$
\begin{align*}
H_{11} & \leq \sum_{n=1}^{\infty} n^{\alpha p-2-q \alpha}\left(\sum_{i=1}^{n} a_{n i}^{2}\right)^{q / 2} E\left(\sup _{i \geq 1} E\left(X_{i}^{2} \mid \mathscr{F}_{i-1}\right)\right)^{q / 2} \\
& \leq K_{4} \sum_{n=1}^{\infty} n^{\alpha p-2-q \alpha+q / 2}<\infty \tag{17}
\end{align*}
$$

following from the fact that $q>2(\alpha p-1) /(2 \alpha-1)$. Meanwhile, by $C_{r}$ inequality, Lemma 4 , and (4),

$$
\begin{align*}
H_{12} \leq & K_{5} \sum_{n=1}^{\infty} n^{\alpha p-2-q \alpha} \sum_{i=1}^{n}\left|a_{n i}\right|^{q} E\left[\left|X_{i}\right|^{q} \mathbb{1}\left(\left|X_{i}\right| \leq n^{\alpha}\right)\right] \\
\leq & K_{6} \sum_{n=1}^{\infty} n^{\alpha p-1-q \alpha} E\left[X^{q} \mathbb{1}\left(X \leq n^{\alpha}\right)\right] \\
& +K_{7} \sum_{n=1}^{\infty} n^{\alpha p-1} P\left(X>n^{\alpha}\right)  \tag{18}\\
\leq & K_{6} \sum_{n=1}^{\infty} n^{\alpha p-1-q \alpha} E\left[X^{q} \mathbb{1}\left(X \leq n^{\alpha}\right)\right] \\
& +K_{7} \sum_{n=1}^{\infty} n^{\alpha p-1-\alpha} E\left[X \mathbb{1}\left(X>n^{\alpha}\right)\right] \\
= & K_{6} H_{11}^{*}+K_{7} H_{12}^{*} .
\end{align*}
$$

By the conditions $p \geq 2$ and $\alpha>1 / 2$, we have that $2(\alpha p-$ $1) /(2 \alpha-1)-p \geq 0$, which implies $q>p$. So, we obtain by $E X^{p}<\infty$ that

$$
\begin{align*}
H_{11}^{*} & =\sum_{n=1}^{\infty} n^{\alpha p-1-q \alpha} \sum_{i=1}^{n} E\left[X^{q} \mathbb{1}\left((i-1)^{\alpha}<X \leq i^{\alpha}\right)\right] \\
& =\sum_{i=1}^{\infty} E\left[X^{q} \mathbb{1}\left((i-1)^{\alpha}<X \leq i^{\alpha}\right)\right] \sum_{n=i}^{\infty} n^{\alpha p-1-q \alpha}  \tag{19}\\
& \leq K_{8} \sum_{i=1}^{\infty} E\left[X^{p} X^{q-p} \mathbb{1}\left((i-1)^{\alpha}<X \leq i^{\alpha}\right)\right] i^{\alpha p-q \alpha} \\
& \leq K_{8} E X^{p}<\infty .
\end{align*}
$$

By the proof of (12), one has that

$$
\begin{equation*}
H_{12}^{*}=\sum_{n=1}^{\infty} n^{\alpha p-1-\alpha} E\left[X \mathbb{1}\left(X>n^{\alpha}\right)\right] \leq K_{9} E X^{p}<\infty \tag{20}
\end{equation*}
$$

Thus, by (15)-(20), we have that $H_{1}<\infty$. So, it completes the proof of (5).

Proof of Corollary 6. If $p=2 l$ and $\alpha=2 / p$, then one has $\alpha p=$ 2 . So as an application of Theorem 5, one gets (6) immediately. On the other hand, it can be seen that

$$
\begin{align*}
& \sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} E\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} X_{i}\right|-\varepsilon n^{\alpha}\right)^{+} \\
& \quad=\sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} \int_{0}^{\infty} P\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} X_{i}\right|-\varepsilon n^{\alpha}>t\right) d t \\
& \quad \geq \sum_{n=1}^{\infty} n^{\alpha p-2-\alpha} \int_{0}^{\varepsilon n^{\alpha}} P\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} X_{i}\right|-\varepsilon n^{\alpha}>t\right) d t \\
& \quad \geq \varepsilon \sum_{n=1}^{\infty} n^{\alpha p-2} P\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} X_{i}\right|>2 \varepsilon n^{\alpha}\right) . \tag{21}
\end{align*}
$$

So by (5) and (21) with $\alpha p=2$, we have for every $\varepsilon>0$ that

$$
\begin{equation*}
\sum_{n=1}^{\infty} P\left(\max _{1 \leq k \leq n}\left|\sum_{i=1}^{k} a_{n i} X_{i}\right|>\varepsilon n^{1 / l}\right)<\infty \tag{22}
\end{equation*}
$$

It follows from Borel-Cantelli lemma that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \frac{1}{n^{1 / l}} \sum_{i=1}^{n} a_{n i} X_{i}=0, \quad \text { a.s. } \tag{23}
\end{equation*}
$$

So, (7) holds.
Proof of Theorem 7. Since $\left\{a_{n i} X_{i}, \mathscr{F}_{i}, 1 \leq i \leq n\right\}$ are martingale differences, it can be found by Lemmas 2 and 4 and (8) that

$$
\begin{align*}
E\left(\frac{1}{n^{r}} \sum_{i=1}^{n} a_{n i} X_{i}\right)^{2} & =\frac{1}{n^{2 r}} E\left(\sum_{i=1}^{n} a_{n i} X_{i}\right)^{2} \leq \frac{K_{1}}{n^{2 r}} \sum_{i=1}^{n} a_{n i}^{2} E X_{i}^{2} \\
& \leq \frac{K_{2}}{n^{2 r}} E X^{2} \sum_{i=1}^{n} a_{n i}^{2} \leq \frac{K_{3}}{n^{2 r-1}}, \quad n \geq 1 . \tag{24}
\end{align*}
$$

Consequently, (9) holds true.

## 3. Applications to the Convergence of the State Observers of Linear-Time-Invariant Systems

In this section, we give the applications of Corollary 6 and Theorem 7 to study the convergence of the state observers of linear-time-invariant systems.

For $t \geq 0$, consider an MISO (multi-input-single-output) linear-time-invariant system

$$
\begin{align*}
& \dot{x}(t)=A x(t)+B u(t),  \tag{25}\\
& y(t)=C x(t),
\end{align*}
$$

where $A \in R^{m_{0} \times m_{0}}, B \in R^{m_{0} \times m_{1}}$, and $C \in R^{1 \times m_{0}}$ are known system matrices, and for $t \geq 0, u(t) \in R^{m_{1}}$ is the control input,
$x(t) \in R^{m_{0}}$ is the state, and $y(t) \in R$ is the system output. The initial state $x(0)$ is unknown. We are interested in estimation of $x(t)$, from some limited observations on $y(t)$.

In our setup, the output $y(t)$ is only measured at a sequence of sampling time instants $\left\{t_{i}\right\}$ with measured values $\gamma\left(t_{i}\right)$, and noise $d_{i}$

$$
\begin{equation*}
\gamma\left(t_{i}\right)=y\left(t_{i}\right)-d_{i} . \tag{26}
\end{equation*}
$$

We would like to estimate the state $x(t)$ from information on $u(t)$, $\left\{t_{i}\right\}$, and $\left\{\gamma\left(t_{i}\right)\right\}$. In practical systems, the irregular sampling sequences $\left\{\gamma\left(t_{i}\right)\right\}$ can be generated by different means such as randomized sampling, event-triggered sampling, and signal quantization.

It is obvious that state estimation will not be possible if the system is not observable. Also, in this paper, $d_{k}$ is assumed to be martingale difference. We give the following assumption.

Assumption 9. The system (25) is observable; that is, the observability matrix

$$
\begin{equation*}
W_{o}^{\prime}=\left[C^{\prime},(C A)^{\prime}, \ldots,\left(C A^{m_{0}-1}\right)^{\prime}\right] \tag{27}
\end{equation*}
$$

has full rank.
For both $t>t_{0}$ and $t<t_{0}$, the solution to system (25) can be expressed as

$$
\begin{equation*}
x(t)=e^{A\left(t-t_{0}\right)} x\left(t_{0}\right)+\int_{t_{0}}^{t} e^{A(t-\tau)} B u(\tau) d \tau . \tag{28}
\end{equation*}
$$

Suppose that $\left\{t_{i}, 1 \leq i \leq n\right\}$ is a sequence of sampling times. For $t_{i} \leq t_{n}$, we have

$$
\begin{equation*}
\gamma\left(t_{i}\right)+d_{i}=y\left(t_{i}\right)=C e^{A\left(t_{i}-t_{n}\right)} x\left(t_{n}\right)+C \int_{t_{n}}^{t_{i}} e^{A\left(t_{i}-\tau\right)} B u(\tau) d \tau . \tag{29}
\end{equation*}
$$

Since the second term is known, it will be denoted by $v\left(t_{i}, t_{n}\right)=C \int_{t_{n}}^{t_{i}} e^{A\left(t_{i}-\tau\right)} B u(\tau) d \tau$. This leads to the observations

$$
\begin{equation*}
C e^{A\left(t_{i}-t_{n}\right)} x\left(t_{n}\right)=\gamma\left(t_{i}\right)-v\left(t_{i}, t_{n}\right)+d_{i}, \quad 1 \leq i \leq n . \tag{30}
\end{equation*}
$$

Define

$$
\begin{array}{cc}
\Phi_{n}=\left[\begin{array}{c}
C e^{A\left(t_{1}-t_{n}\right)} \\
\vdots \\
C e^{A\left(t_{n-1}-t_{n}\right)} \\
C
\end{array}\right], & \Gamma_{n}=\left[\begin{array}{c}
\gamma\left(t_{1}\right) \\
\vdots \\
\gamma\left(t_{n-1}\right) \\
\gamma\left(t_{n}\right)
\end{array}\right],  \tag{31}\\
V_{n}=\left[\begin{array}{c}
v\left(t_{1}, t_{n}\right) \\
\vdots \\
v\left(t_{n-1}, t_{n}\right) \\
0
\end{array}\right], \quad D_{n}=\left[\begin{array}{c}
d_{1} \\
\vdots \\
d_{n-1} \\
d_{n}
\end{array}\right] .
\end{array}
$$

Then, (30) can be written as

$$
\begin{equation*}
\Phi_{n} x\left(t_{n}\right)=\Gamma_{n}-V_{n}+D_{n} . \tag{32}
\end{equation*}
$$

Suppose that $\Phi_{n}$ is full rank, which will be established later. Then, a least-squares estimate of $x\left(t_{n}\right)$ is given by

$$
\begin{equation*}
\widehat{x}\left(t_{n}\right)=\left(\Phi_{n}^{\prime} \Phi_{n}\right)^{-1} \Phi_{n}^{\prime}\left(\Gamma_{n}-V_{n}\right) \tag{33}
\end{equation*}
$$

Here, $G^{\prime}$ denotes the transpose of $G$. From (32) and (33), the estimation error for $x\left(t_{n}\right)$ at sampling time $t_{n}$ is

$$
\begin{align*}
e\left(t_{n}\right) & =\widehat{x}\left(t_{n}\right)-x\left(t_{n}\right)=\left(\Phi_{n}^{\prime} \Phi_{n}\right)^{-1} \Phi_{n}^{\prime} D_{n} \\
& =\left(\frac{1}{n^{r}} \Phi_{n}^{\prime} \Phi_{n}\right)^{-1} \frac{1}{n^{r}} \Phi_{n}^{\prime} D_{n} \tag{34}
\end{align*}
$$

for some $1 / 2<r<1$. For convergence analysis, one must consider a typical entry in $\left(1 / n^{r}\right) \Phi_{n}^{\prime} D_{n}$. By the Cayley Hamilton theorem (see Ogata [18]), the matrix exponential can be expressed by a polynomial function of $A$ of order at most $m_{0}-1$,

$$
\begin{equation*}
e^{A t}=\alpha_{1}(t) I+\cdots+\alpha_{m_{0}}(t) A^{m_{0}-1} \tag{35}
\end{equation*}
$$

where the time functions $\alpha_{i}(t)$ can be derived by the Lagrange-Hermite interpolation method (see Ogata [18]). This implies that

$$
\begin{align*}
C e^{A\left(t_{i}-t_{n}\right)} & =\left[\alpha_{1}\left(t_{i}-t_{n}\right), \ldots, \alpha_{m_{0}}\left(t_{i}-t_{n}\right)\right]\left[\begin{array}{c}
C \\
C A \\
\vdots \\
C A^{m_{0}-1}
\end{array}\right] \\
& =\varphi^{\prime}\left(t_{i}-t_{n}\right) W_{o} \tag{36}
\end{align*}
$$

where $\varphi^{\prime}\left(t_{i}-t_{n}\right)=\left[\alpha_{1}\left(t_{i}-t_{n}\right), \ldots, \alpha_{m_{0}}\left(t_{i}-t_{n}\right)\right]$ and $W_{o}$ is the observability matrix.

Denote

$$
\Psi_{n}=\left[\begin{array}{c}
\varphi^{\prime}\left(t_{1}-t_{n}\right)  \tag{37}\\
\vdots \\
\varphi^{\prime}(0)
\end{array}\right]
$$

Then

$$
\begin{equation*}
\Phi_{n}=\Psi_{n} W_{o} \tag{38}
\end{equation*}
$$

which implies that

$$
\begin{align*}
& \frac{1}{n^{r}} \Phi_{n}^{\prime} \Phi_{n}=W_{o}^{\prime} \frac{1}{n^{r}} \Psi_{n}^{\prime} \Psi_{n} W_{o},  \tag{39}\\
& \frac{1}{n^{r}} \Phi_{n}^{\prime} D_{n}=\frac{1}{n^{r}} W_{o}^{\prime} \Psi_{n}^{\prime} D_{n} .
\end{align*}
$$

As a result, for any $r>0$, one has

$$
\begin{equation*}
e\left(t_{n}\right)=\left(\frac{1}{n^{r}} \Phi_{n}^{\prime} \Phi_{n}\right)^{-1} \frac{1}{n^{r}} \Phi_{n}^{\prime} D_{n}=W_{o}^{-1}\left(\frac{1}{n^{r}} \Psi_{n}^{\prime} \Psi_{n}\right)^{-1} \frac{1}{n^{r}} \Psi_{n}^{\prime} D_{n} \tag{40}
\end{equation*}
$$

Under Assumption 9, $W_{0}^{-1}$ exists. Convergence results will be established by the following two sufficient conditions: $\left(1 / n^{r}\right) \Psi_{n}^{\prime} D_{n} \rightarrow 0$ and $\left(1 / n^{r}\right) \Psi_{n}^{\prime} \Psi_{n} \geq \beta I$, for some $\beta>0$. So we need the following persistent excitation (PE) condition, which was used by Wang et al. [19] and Thanh et al. [20].

Assumption 10. For some $1 / 2<r<1$,

$$
\begin{equation*}
\beta=\inf _{n \geq 1} \sigma_{\min }\left(\frac{1}{n^{r}} \Psi_{n}^{\prime} \Psi_{n}\right)>0, \tag{41}
\end{equation*}
$$

where $\sigma_{\min }(H)$ is the small eigenvalue of $H$ for a suitable symmetric $H$.

We can investigate the convergence of double-indexed summations of random variables form

$$
\begin{equation*}
\frac{1}{n^{r}} \sum_{i=1}^{n} a_{n i} d_{i} \tag{42}
\end{equation*}
$$

for some $1 / 2<r<1$. Here, $\left\{a_{n i}\right\}$ is a triangular array of real numbers and $\left\{d_{i}\right\}$ is a sequence of martingale differences. It can be seen that (42) is a special case of (7) in Corollary 6. The $j$ th component of $\left(1 / n^{r}\right) \Psi_{n}^{\prime} D_{n}$ takes the form

$$
\begin{equation*}
\frac{1}{n^{r}} \sum_{i=1}^{n} \alpha_{j}\left(t_{i}-t_{n}\right) d_{i}, \tag{43}
\end{equation*}
$$

where $\left\{\alpha_{j}\left(t_{i}-t_{n}\right)\right\}$ is a triangular array of real numbers. The convergence analysis of (43) for $e\left(t_{n}\right)$ is a special case of (42) or (7) in Corollary 6.

Recently, Wang et al. [19] investigated the convergence analysis of the state observers of linear-time-invariant systems under $\rho^{*}$-mixing sampling. Thanh et al. [20] studied the convergence analysis of double-indexed and randomly weighted sums of $\rho^{*}$-mixing sequence and gave its application to state observers. For more related works, one can refer to [18-23] and the references therein.

As an application of Corollary 6 to the observers and state estimation, we obtain the following theorem.

Theorem 11. Let Assumptions 9 and 10 hold. Let $1 / 2<$ $r<1$ and $\left\{d_{n}, \mathscr{F}_{n}, n \geq 1\right\}$ be martingale differences stochastically dominated by a nonnegative random variable $d$ with $E d^{2 / r}<\infty$. Suppose that for any $q>2 /(2 r-1)$, one has $E\left[\sup _{n \geq 1} E\left(d_{n}^{2} \mid \mathscr{F}_{n-1}\right)\right]^{q / 2}<\infty$ and

$$
\begin{equation*}
\sum_{i=1}^{n}\left|\alpha_{j}\left(t_{i}-t_{n}\right)\right|^{q}=O(n) \tag{44}
\end{equation*}
$$

where $1 \leq j \leq m_{0}$. Then

$$
\begin{equation*}
\frac{1}{n^{r}}\left\|\Psi_{n}^{\prime} D_{n}\right\| \longrightarrow 0, \quad \text { a.s. } \tag{45}
\end{equation*}
$$

Consequently,

$$
\begin{equation*}
e\left(t_{n}\right) \longrightarrow 0, \quad \text { a.s. } \tag{46}
\end{equation*}
$$

As an application to Theorem 7, we get the following result.

Theorem 12. Let $1 / 2<r<1$ and Assumptions 9 and 10 hold. Assume that $\left\{d_{n}, \mathscr{F}_{n}, n \geq 1\right\}$ are martingales differences stochastically dominated by a nonnegative random variable d with $E d^{2}<\infty$. For $1 \leq j \leq m_{0}$, it is supposed that

$$
\begin{equation*}
\sum_{i=1}^{n} \alpha_{j}^{2}\left(t_{i}-t_{n}\right)=O(n) \tag{47}
\end{equation*}
$$

Then

$$
\begin{equation*}
\zeta=\sup _{n \geq 1} n^{2 r-1} E e^{\prime}\left(t_{n}\right) e\left(t_{n}\right)<\infty . \tag{48}
\end{equation*}
$$

Remark 13. If we assume that, for each $1 \leq i \leq n,\left\{\varphi\left(t_{i}-t_{n}\right)\right\}$ is uniformly bounded, then we can find that condition (44) holds for any $q$. On the other hand, similar to Theorems 11 and 12, Wang et al. [19] also obtained the convergence of the state observers with probability one and in mean square under $\rho^{*}$ mixing sampling (see Theorems 4 and 5 of Wang et al. [19]). So Theorems 11 and 12 generalize the results of Wang et al. [19] to the case of martingale differences.

Proof of Theorem 11. It can be seen that

$$
\frac{1}{n^{r}} \Psi_{n}^{\prime} D_{n}=\left[\begin{array}{c}
\frac{1}{n^{r}} \sum_{i=1}^{n} \alpha_{1}\left(t_{i}-t_{n}\right) d_{i}  \tag{49}\\
\vdots \\
\frac{1}{n^{r}} \sum_{i=1}^{n} \alpha_{m_{0}}\left(t_{i}-t_{n}\right) d_{i}
\end{array}\right] .
$$

To prove (45), it suffices to look at the $j$ th component

$$
\begin{equation*}
\frac{1}{n^{r}} \sum_{i=1}^{n} \alpha_{j}\left(t_{i}-t_{n}\right) d_{i} \tag{50}
\end{equation*}
$$

of

$$
\begin{equation*}
\frac{1}{n^{r}} \Psi_{n}^{\prime} D_{n} \tag{51}
\end{equation*}
$$

For any $q>2 /(2 r-1)$, by $E\left[\sup _{n \geq 1} E\left(d_{n}^{2} \mid \mathscr{F}_{n-1}\right)\right]^{q / 2}<\infty$ and (44), we can obtain (45) from Corollary 6 with $l=1 / r$, $a_{n i}=\alpha_{j}\left(t_{i}-t_{n}\right)$ in (43), and $X_{n}=d_{n}$.

On the other hand, by Assumption 9, $W_{0}^{-1}$ exists, and by (41) in Assumption 10, $\left(\left(1 / n^{r}\right) \Psi_{n}^{\prime} \Psi_{n}\right)^{-1}$ exists and

$$
\begin{equation*}
\sigma_{\max }\left(\left(\frac{1}{n^{r}} \Psi_{n}^{\prime} \Psi_{n}\right)^{-1}\right) \leq \frac{1}{\beta}, \tag{52}
\end{equation*}
$$

where $\sigma_{\max }(\cdot)$ is the largest eigenvalue. Together with

$$
\begin{equation*}
e\left(t_{n}\right)=W_{o}^{-1}\left(\frac{1}{n^{r}} \Psi_{n}^{\prime} \Psi_{n}\right)^{-1} \frac{1}{n^{r}} \Psi_{n}^{\prime} D_{n} \tag{53}
\end{equation*}
$$

and (45), it follows (46).
Proof of Theorem 12. For $1 \leq j \leq m_{0}$, by (47), (8) holds. Applying Theorem 7 with $a_{n i}=\alpha_{j}\left(t_{i}-t_{n}\right), X_{n}=d_{n}$, and $1 / 2<r<1$, we obtain that for a typical term

$$
\begin{equation*}
\frac{1}{n^{r}} \sum_{i=1}^{n} \alpha_{j}\left(t_{i}-t_{n}\right) d_{i} \tag{54}
\end{equation*}
$$

in (49),

$$
\begin{equation*}
n^{2 r-1} E\left(\frac{1}{n^{r}} \sum_{i=1}^{n} \alpha_{j}\left(t_{i}-t_{n}\right) d_{i}\right)^{2} \leq K_{1}, \quad n \geq 1 \tag{55}
\end{equation*}
$$

Together with (49), (53), and (55), we obtain that

$$
\begin{equation*}
n^{2 r-1} E e^{\prime}\left(t_{n}\right) e\left(t_{n}\right) \leq m_{0} K_{2}<\infty, \tag{56}
\end{equation*}
$$

where $K_{2}$ is a positive constant. Lastly, by (56), (48) holds true.

## Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
