Keywords: $\alpha$-stable process, Stochastic Navier-Stokes equation, Invariant measure

Abstract
In this note we prove the well-posedness for stochastic 2D Navier-Stokes equation driven by general Lévy processes (in particular, $\alpha$-stable processes), and obtain the existence of invariant measures.

## 1 Introduction and Main Result

In this article we are concerned with the following stochastic 2D Navier-Stokes equation in torus $\mathrm{T}^{2}=(0,1]^{2}$ :

$$
\begin{equation*}
\mathrm{d} u_{t}=\left[\Delta u_{t}-\left(u_{t} \cdot \nabla\right) u_{t}+\nabla p_{t}\right] \mathrm{d} t+\mathrm{d} L_{t}, \quad \operatorname{div} u_{t}=0, \quad u_{0}=\varphi \in \mathbb{H}^{0} \tag{1.1}
\end{equation*}
$$

where $u_{t}(x)=\left(u_{t}^{1}(x), u_{t}^{2}(x)\right)$ is the 2D-velocity field, $p$ is the pressure, and $\left(L_{t}\right)_{t \geqslant 0}$ is an infinite dimensional cylindrical Lévy process given by

$$
L_{t}=\sum_{j \in \mathbb{N}} \beta_{j} L_{t}^{(j)} e_{j}
$$

[^0]where $\left\{\left(L_{t}^{(j)}\right)_{t \geqslant 0}, j \in \mathbb{N}\right\}$ is a sequence of independent one dimensional purely discontinuous Lévy processes defined on some filtered probability space $\left(\Omega, \mathscr{F},\left(\mathscr{F}_{t}\right)_{t \geq 0} ; P\right)$ and with the same Lévy measure $v,\left\{\beta_{j}, j \in \mathbb{N}\right\}$ is a sequence of positive numbers and $\left\{e_{j}, j \in \mathbb{N}\right\}$ is a sequence of orthonormal basis of Hilbert space $\mathbb{H}^{0}$, where for $\gamma \in \mathbb{R}, \mathbb{H}^{\gamma}$ with the norm $\|\cdot\|_{\gamma}$ and inner product $\langle\cdot, \cdot\rangle_{\gamma}$ denotes the usual Sobolev space of divergence free vector fields on $\mathbb{T}^{2}$ (see Section 2 for a definition).
As a continuous model, stochastic Navier-Stokes equation driven by Brownian motion has been extensively studied in the past decades (cf. [9, 3, 5, 8], etc.). Meanwhile, stochastic partial differential equation with jump has also been studied recently (cf. [11, 6]). However, in the well-known results, the assumption that the jump process has finite second order moments was required in order to obtain the usual energy estimate. This excludes the interest $\alpha$-stable process. In this note, we establish the well posedness for stochastic 2D Navier-Stokes equation (1.1) driven by a general cylindrical Lévy process, and obtain the existence of invariant measures for this discontinuous model. More precisely, we shall prove that:

Theorem 1.1. Suppose that for some $\theta \in(0,1]$,

$$
\left(\mathbf{H}_{\theta}\right): \quad H_{\theta}:=\int_{|x|>1}|x|^{\theta} v(\mathrm{~d} x)+\int_{|x| \leqslant 1}|x|^{2 \theta} v(\mathrm{~d} x)+\sum_{j \in \mathbb{N}}\left|\beta_{j}\right|^{\theta}<+\infty .
$$

Then for any $\varphi \in \mathbb{H}^{0}$, there exists a unique solution $\left(u_{t}\right)_{t \geqslant 0}=\left(u_{t}(\varphi)\right)_{t \geqslant 0}$ to equation (1.1) satisfying that for $P$-almost all $\omega$ and for any $t>0$,
(i) $t \mapsto u_{t}(\omega)$ is right continuous and has left-hand limit in $\mathbb{H}^{0}$, and $\int_{0}^{t}\left\|\nabla u_{s}(\omega)\right\|_{0}^{2} \mathrm{~d} s<+\infty$;
(ii) it holds that for any $\phi \in \mathbb{H}^{1}$,

$$
\left\langle u_{t}(\omega), \phi\right\rangle_{0}=\langle\varphi, \phi\rangle_{0}+\int_{0}^{t}\left[\left\langle\Delta u_{s}(\omega), \phi\right\rangle_{0}+\left\langle u_{s}(\omega) \otimes u_{s}(\omega), \nabla \phi\right\rangle_{0}\right] \mathrm{d} s+\left\langle L_{t}(\omega), \phi\right\rangle_{0}
$$

Moreover, there exists a constant $C=C\left(H_{\theta}, \theta\right)>0$ such that for any $t>0$,

$$
\begin{equation*}
\mathbb{E}\left(\sup _{s \in[0, t]}\left\|u_{s}\right\|_{0}^{\theta}\right)+\mathbb{E}\left(\int_{0}^{t} \frac{\left\|\nabla u_{s}\right\|_{0}^{2}}{\left(\left\|u_{s}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s\right) \leqslant C\left(1+\|\varphi\|_{0}^{\theta}+t\right) . \tag{1.2}
\end{equation*}
$$

In particular, there exists a probability measure $\mu$ on $\left(\mathrm{H}^{0}, \mathscr{B}\left(\mathrm{H}^{0}\right)\right)$ called invariant measure of $\left(u_{t}(\varphi)\right)_{t \geqslant 0}$ such that for any bounded measurable functional $\Phi$ on $H^{0}$,

$$
\int_{\mathbb{H}^{0}} \mathbb{E} \Phi\left(u_{t}(\varphi)\right) \mu(\mathrm{d} \varphi)=\int_{\mathbb{H}^{0}} \Phi(\varphi) \mu(\mathrm{d} \varphi)
$$

Remark 1.2. Assumption $\left(\mathbf{H}_{\theta}\right)$ implies that cylindrical Lévy process $\left(L_{t}\right)_{t \geqslant 0}$ admits a càdlàg version in $\mathbb{H}^{0}$ and for any $t>0$ (cf. [12, p.159, Theorem 25.3]),

$$
\mathbb{E}\left\|L_{t}\right\|_{0}^{\theta}<+\infty
$$

In fact, for $\theta \in(0,1]$, by the elementary inequality $(a+b)^{\theta} \leqslant a^{\theta}+b^{\theta}$, we have

$$
\mathbb{E}\left\|L_{t}\right\|_{0}^{\theta} \leqslant \mathbb{E}\left(\sum_{j \in \mathbb{N}}\left|\beta_{j}\right| \cdot\left|L_{t}^{(j)}\right|\right)^{\theta} \leqslant \sum_{j \in \mathbb{N}}\left|\beta_{j}\right|^{\theta} \cdot \mathbb{E}\left|L_{t}^{(j)}\right|^{\theta}=\mathbb{E}\left|L_{t}^{(1)}\right|^{\theta} \sum_{j \in \mathbb{N}}\left|\beta_{j}\right|^{\theta}<+\infty .
$$

Moreover, $\left(\mathbf{H}_{\theta}\right)$ admits $v(\mathrm{~d} x)=\mathrm{d} x /|x|^{1+\alpha}$ with $\alpha \in(\theta, 2 \theta)$.

Remark 1.3. By estimate (1.2) and Poincàre's inequality, we have

$$
\begin{aligned}
\mathbb{E}\left(\int_{0}^{t}\left\|\nabla u_{s}\right\|_{0}^{\theta} \mathrm{d} s\right) & \leqslant \mathbb{E}\left(\int_{0}^{t} \frac{\left\|\nabla u_{s}\right\|_{0}^{\theta}\left(\left\|u_{s}\right\|_{0}^{2-\theta}+1\right)}{\left(\left\|u_{s}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s\right) \\
& \leqslant C \mathbb{E}\left(\int_{0}^{t} \frac{\left\|\nabla u_{s}\right\|_{0}^{2}+1}{\left(\left\|u_{s}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s\right) \\
& \leqslant C\left(1+\|\varphi\|_{0}^{\theta}+t\right)
\end{aligned}
$$

This estimate in particular yields the existence of invariant measures by the classical BogoliubovKrylov's argument (cf. [4]).

Remark 1.4. An obvious open question is about the uniqueness of invariant measures (i.e. ergodicity) for discontinuous system (1.1). The notion of asymptotic strong Feller property in [9] is perhaps helpful for solving this problem.

This paper is organized as follows: In Section 2, we give some necessary materials. In Section 3, we prove the main result.

## 2 Preliminaries

In this section we prepare some materials for later use. Let $C_{0}^{\infty}\left(T^{2}\right)^{2}$ be the space of all smooth $\mathbb{R}^{2}$-valued function on $\mathbb{T}^{2}$ with vanishing mean and divergence, i.e.,

$$
\int_{\mathbb{T}^{2}} f(x) \mathrm{d} x=0, \operatorname{div} f(x)=0
$$

For $\gamma \in \mathbb{R}$, let $\mathbb{H}^{\gamma}$ be the completion of $C_{0}^{\infty}\left(\mathbb{T}^{2}\right)^{2}$ with respect to the norm

$$
\|f\|_{\gamma}=\left(\int_{\mathbb{T}^{2}}\left|(-\Delta)^{\gamma / 2} f(x)\right|^{2} \mathrm{~d} x\right)^{1 / 2}
$$

where $(-\Delta)^{\gamma / 2}$ is defined through Fourier's transform. Thus, $\left(H^{\gamma},\|\cdot\|_{\gamma}\right)$ is a separable Hilbert space with the obvious inner product

$$
\langle f, g\rangle_{\gamma}:=\int_{\mathbb{T}^{2}}(-\Delta)^{\gamma / 2} f(x) \cdot(-\Delta)^{\gamma / 2} g(x) \mathrm{d} x
$$

Below, we shall fix an orthonormal basis $\left\{e_{j}, j \in \mathbb{N}\right\} \subset C_{0}^{\infty}\left(\mathbb{T}^{2}\right)^{2}$ of $H^{0}$ consisting of the eigenvectors of $\Delta$, i.e.,

$$
\begin{equation*}
\Delta e_{j}=-\lambda_{j} e_{j}, \quad\left\langle e_{j}, e_{j}\right\rangle_{0}=1, \quad j=1,2, \cdots \tag{2.1}
\end{equation*}
$$

where $0<\lambda_{1} \leqslant \cdots \leqslant \lambda_{j} \uparrow \infty$.
Let $\left\{\left(L_{t}^{(j)}\right)_{t \geqslant 0}, j \in \mathbb{N}\right\}$ be a sequence of independent one dimensional purely discontinuous Lévy processes with the same characteristic function, i.e.,

$$
\mathbb{E} e^{\mathrm{i} \xi L_{t}^{(j)}}=e^{-t \psi(\xi)}, \forall t \geqslant 0, j=1,2, \cdots
$$

where $\psi(\xi)$ is a complex valued function called Lévy symbol given by

$$
\psi(\xi)=\int_{\mathbb{R} \backslash\{0\}}\left(e^{\mathrm{i} \xi y}-1-\mathrm{i} \xi y 1_{|y| \leqslant 1}\right) v(\mathrm{~d} y)
$$

where $v$ is the Lévy measure and satisfies that

$$
\int_{\mathbb{R} \backslash\{0\}} 1 \wedge|y|^{2} v(\mathrm{~d} y)<+\infty
$$

For $t>0$ and $\Gamma \in \mathscr{B}(\mathbb{R} \backslash\{0\})$, the Poisson random measure associated with $L_{t}^{(j)}$ is defined by

$$
N^{(j)}(t, \Gamma):=\sum_{s \in(0, t]} 1_{\Gamma}\left(L_{s}^{(j)}-L_{s-}^{(j)}\right) .
$$

The compensated Poisson random measure is given by

$$
\tilde{N}^{(j)}(t, \Gamma)=N^{(j)}(t, \Gamma)-t v(\Gamma) .
$$

By Lévy-Itô's decomposition (cf. [2, p.108, Theorem 2.4.16]), one has

$$
L_{t}^{(j)}=\int_{|x| \leqslant 1} x \tilde{N}^{(j)}(t, \mathrm{~d} x)+\int_{|x|>1} x N^{(j)}(t, \mathrm{~d} x)
$$

For a Polish space $(\mathbb{G}, \rho)$, let $\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{G}\right)$ be the space of all right continuous functions with left-hand limits from $\mathbb{R}_{+}$to $\mathbb{G}$, which is endowed with the Skorohod topology:

$$
\begin{equation*}
d_{\mathrm{G}}(u, v):=\inf _{\lambda \in \Lambda}\left[\sup _{s \neq t}\left|\log \frac{\lambda(t)-\lambda(s)}{t-s}\right| \vee \int_{0}^{\infty} \sup _{t \geqslant 0}\left(\rho\left(u_{t \wedge r}, v_{\lambda(t) \wedge r}\right) \wedge 1\right) e^{-r} \mathrm{~d} r\right], \tag{2.2}
\end{equation*}
$$

where $\Lambda$ is the space of all continuous and strictly increasing function from $\mathbb{R}_{+} \rightarrow \mathbb{R}_{+}$with $\lambda(0)=$ 0 and $\lambda(\infty)=\infty$. Thus, $\left(\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{G}\right) ; d_{\mathbb{G}}\right)$ is again a Polish space (cf. [7, p.121, Theorem 5.6]).
We need the following tightness criterion, which is a direct combination of [10, Corollary 5.2] and Aldous's criterion [1].
Theorem 2.1. Let $\left\{\left(X_{t}^{n}\right)_{t \geqslant 0}, n \in \mathbb{N}\right\}$ be a sequence of $H^{-1}$-valued stochastic processes with càdlàg path. Assume that
(i) for each $\phi \in C_{0}^{\infty}\left(\mathbb{T}^{2}\right)^{2}$ and $t>0, \lim _{K \rightarrow \infty} \sup _{n \in \mathbb{N}} P\left\{\sup _{s \in[0, t]}\left|\left\langle X_{s}^{n}, \phi\right\rangle_{-1}\right| \geqslant K\right\}=0$;
(ii) for each $\phi \in C_{0}^{\infty}\left(\mathbb{T}^{2}\right)^{2}$ and $t, a>0$,

$$
\lim _{\varepsilon \rightarrow 0+} \sup _{n \in \mathbb{N}} \sup _{\tau \in \mathscr{S}_{t}} P\left\{\left|\left\langle X_{\tau}^{n}-X_{\tau+\varepsilon}^{n}, \phi\right\rangle_{-1}\right| \geqslant a\right\}=0
$$

where $\mathscr{S}_{t}$ denotes the class of all $\left(\mathscr{F}_{t}\right)$-stopping times with bound $t$;
(iii) for every $\varepsilon>0$ and $t>0$,

$$
\lim _{m \rightarrow \infty} \sup _{n \in \mathbb{N}} P\left(\sup _{s \in[0, t]} \sum_{j=m}^{\infty}\left\langle X_{s}^{n}, e_{j}\right\rangle_{-1}^{2} \geqslant \varepsilon\right)=0
$$

Then the laws of $\left(X_{t}^{n}\right)_{t \geqslant 0}$ in $\mathrm{D}\left(\mathbb{R}_{+} ; \mathrm{H}^{-1}\right)$ are tight.
The following result comes from [7, p. 131 Theorem 7.8].
Theorem 2.2. Suppose that stochastic processes sequence $\left\{\left(X_{t}^{n}\right)_{t \geqslant 0}, n \in \mathbb{N}\right\}$ weakly converges to $\left(X_{t}\right)_{t \geqslant 0}$ in $\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{H}^{-1}\right)$. Then, for any $t>0$ and $\phi \in \mathbb{H}^{1}$, there exists a sequence $t_{n} \downarrow t$ such that for any bounded continuous function $f$,

$$
\lim _{n \rightarrow \infty} \mathbb{E} f\left(\left\langle X_{t_{n}}^{n}, \phi\right\rangle_{-1}\right)=\mathbb{E} f\left(\left\langle X_{t}, \phi\right\rangle_{-1}\right)
$$

We also need the following technical result.
Lemma 2.3. Suppose that sequence $\left\{u^{n}, n \in \mathbb{N}\right\}$ converges to $u$ in $\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{H}^{-1}\right)$. Then for any $T>0$ and $m \in \mathbb{N}$,

$$
\begin{equation*}
\sup _{t \in[0, T]}\left\|u_{t}\right\|_{0} \leqslant \underline{\lim }_{n \rightarrow \infty} \sup _{t \in\left[0, T+\frac{1}{m}\right]}\left\|u_{t}^{n}\right\|_{0} \tag{2.3}
\end{equation*}
$$

If in addition, for Lebesgue almost all $t$, $u_{t}^{n}$ converges to $u_{t}$ in $\mathbb{H}^{0}$, then for any $\beta>0$,

$$
\begin{equation*}
\int_{0}^{T} \frac{\left\|\nabla u_{t}\right\|_{0}^{2}}{\left(1+\left\|u_{t}\right\|_{0}^{2}\right)^{\beta}} \mathrm{d} t \leqslant \lim _{n \rightarrow \infty} \int_{0}^{T} \frac{\left\|\nabla u_{t}^{n}\right\|_{0}^{2}}{\left(1+\left\|u_{t}^{n}\right\|_{0}^{2}\right)^{\beta}} \mathrm{d} t \tag{2.4}
\end{equation*}
$$

Proof. Without loss of generality, we assume that the right hand side of (2.3) is finite. For any $\phi \in \mathbb{H}^{1}$, it is clear that $t \mapsto\left\langle u_{t}, \phi\right\rangle_{0}$ is a càdlàg real valued function, and by definition (2.2) of Skorohod metric, we have

$$
d_{\mathbb{R}}\left(\left\langle u^{n}, \phi\right\rangle_{0},\langle u, \phi\rangle_{0}\right) \leqslant\left(2+\|\phi\|_{1}\right) d_{\mathbb{H}^{-1}}\left(u^{n}, u\right)
$$

and so $\left\langle u^{n}, \phi\right\rangle_{0}$ converges to $\langle u, \phi\rangle_{0}$ in $\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{R}\right)$ as $n \rightarrow \infty$. Since the discontinuous points of $\left\langle u_{\text {. }}, \phi\right\rangle_{0}$ are at most countable, for any $T>0$ and $m \in \mathbb{N}$, there exists a time $T_{m} \in(T, T+1 / m)$ such that $\langle u ., \phi\rangle_{0}$ is continuous at $T_{m}$. Thus, we have (cf. [7, p.119, Proposition 5.3])

$$
\lim _{n \rightarrow \infty} \sup _{t \in\left[0, T_{m}\right]}\left|\left\langle u_{t}^{n}, \phi\right\rangle_{0}\right|=\sup _{t \in\left[0, T_{m}\right]}\left|\left\langle u_{t}, \phi\right\rangle_{0}\right| .
$$

Hence,

$$
\begin{aligned}
\sup _{t \in[0, T]}\left\|u_{t}\right\|_{0} & =\sup _{t \in[0, T]} \sup _{\phi \in \mathbb{H}^{1} ;\|\phi\|_{0} \leqslant 1}\left|\left\langle u_{t}, \phi\right\rangle_{0}\right| \\
& \leqslant \sup _{\phi \in \mathbb{H}^{1} ;\|\phi\|_{0} \leqslant 1} \sup _{t \in\left[0, T_{m}\right]}\left|\left\langle u_{t}, \phi\right\rangle_{0}\right| \\
& =\sup _{\phi \in \mathbb{H}^{1} ;\|\phi\|_{0} \leqslant 1} \lim _{n \rightarrow \infty} \sup _{t \in\left[0, T_{m}\right]}\left|\left\langle u_{t}^{n}, \phi\right\rangle_{0}\right| \\
& \leqslant \lim _{n \rightarrow \infty}^{\lim } \sup _{\phi \in \mathbb{H}^{1} ;\|\phi\|_{0} \leqslant 1} \sup _{t \in\left[0, T_{m}\right]}\left|\left\langle u_{t}^{n}, \phi\right\rangle_{0}\right| \\
& =\underset{n \rightarrow \infty}{\lim } \sup _{t \in\left[0, T_{m}\right]}\left\|u_{t}^{n}\right\|_{0} .
\end{aligned}
$$

Thus, (2.3) is proven.
For proving (2.4), let $\mathscr{N}$ be the Lebesgue null set such that for all $t \notin \mathscr{N}, u_{t}^{n}$ converges to $u_{t}$ in $\mathbb{H}^{0}$. Fixing a $t \notin \mathscr{N}$, then as above, we have

$$
\frac{\left\|\nabla u_{t}\right\|_{0}^{2}}{\left(1+\left\|u_{t}\right\|_{0}^{2}\right)^{\beta}} \leqslant \frac{\underline{\lim }_{n \rightarrow \infty}\left\|\nabla u_{t}^{n}\right\|_{0}^{2}}{\left(1+\lim _{n \rightarrow \infty}\left\|u_{t}^{n}\right\|_{0}^{2}\right)^{\beta}} \leqslant \lim _{n \rightarrow \infty} \frac{\left\|\nabla u_{t}^{n}\right\|_{0}^{2}}{\left(1+\left\|u_{t}^{n}\right\|_{0}^{2}\right)^{\beta}} .
$$

Estimate (2.4) now follows by Fatou's lemma.

## 3 Proof of Theorem 1.1

We first give the following definition about the weak solutions to equation (1.1).
Definition 3.1. A probability measure $P$ on $\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{H}^{-1}\right)$ is called a weak solution of equation (1.1) if
(i) for any $t>0, P\left(u \in \mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{H}^{-1}\right): \sup _{s \in[0, t]}\left\|u_{s}\right\|_{0}+\int_{0}^{t}\left\|\nabla u_{s}\right\|_{0}^{2} \mathrm{~d} s<+\infty\right)=1$;
(ii) for any $j \in \mathbb{N}$,

$$
\begin{equation*}
M_{t}^{(j)}(u):=\left\langle u_{t}, e_{j}\right\rangle_{0}-\left\langle u_{0}, e_{j}\right\rangle_{0}-\int_{0}^{t}\left[\left\langle u_{s}, \Delta e_{j}\right\rangle_{0}+\left\langle u_{s} \otimes u_{s}, \nabla e_{j}\right\rangle_{0}\right] \mathrm{d} s \tag{3.1}
\end{equation*}
$$

is a Lévy process with the characteristic function

$$
\mathbb{E} e^{\mathrm{i} \xi M_{t}^{(j)}}=\exp \left\{t \int_{\mathbb{R} \backslash\{0\}}\left(e^{\mathrm{i} \xi y \beta_{j}}-1-\mathrm{i} \xi y \beta_{j} 1_{|y| \leqslant 1}\right) v(\mathrm{~d} y)\right\}
$$

and $\left\{\left(M_{t}^{(j)}\right)_{t \geqslant 0}, j \in \mathbb{N}\right\}$ is a sequence of independent Lévy processes.
Proof of Existence of Weak Solutions: We use Galerkin's approximation to prove the existence of weak solutions and divide the proof into three steps.
(Step 1): For $n \in \mathbb{N}$, set

$$
\mathbb{H}_{n}^{0}:=\operatorname{span}\left\{e_{1}, e_{2}, \cdots, e_{n}\right\}
$$

and let $\Pi_{n}$ be the projection from $\mathbb{H}^{0}$ to $\mathbb{H}_{n}^{0}$ and define

$$
L_{t}^{n}:=\sum_{j=1}^{n} \beta_{j} L_{t}^{(j)} e_{j}=\sum_{j=1}^{n} \int_{|y| \leqslant 1} y \beta_{j} e_{j} \tilde{N}^{(j)}(t, \mathrm{~d} y)+\sum_{j=1}^{n} \int_{|y|>1} y \beta_{j} e_{j} N^{(j)}(t, \mathrm{~d} y)
$$

Consider the following finite dimensional SDE driven by finite dimensional Lévy process $L_{t}^{n}$ :

$$
\begin{equation*}
\mathrm{d} u_{t}^{n}=\left[\Delta u_{t}^{n}-\Pi_{n}\left(\left(u_{t}^{n} \cdot \nabla\right) u_{t}^{n}\right)\right] \mathrm{d} t+\mathrm{d} L_{t}^{n}, u_{0}^{n}=\Pi_{n} \varphi \tag{3.2}
\end{equation*}
$$

Since for any $R>0$ and $u, v \in \mathbb{H}_{n}^{0}$ with $\|u\|_{0},\|v\|_{0} \leqslant R$,

$$
\left\|\Pi_{n}((u \cdot \nabla) u-(v \cdot \nabla) v)\right\|_{0} \leqslant C_{R, n}\|u-v\|_{0}
$$

and

$$
\begin{equation*}
\left\langle u, \Delta u-\Pi_{n}((u \cdot \nabla) u)\right\rangle_{0}=-\|\nabla u\|_{0}, \quad \forall u \in \mathbb{H}_{n}^{0} \tag{3.3}
\end{equation*}
$$

finite dimensional SDE (3.2) is thus well-posed.
Define a smooth function $f_{n}$ on $H_{n}^{0}$ by

$$
f_{n}(u):=\left(\|u\|_{0}^{2}+1\right)^{\theta / 2}, \quad u \in \mathbb{H}_{n}^{0}
$$

By simple calculations, we have

$$
\begin{equation*}
\nabla f_{n}(u)=\frac{\theta u}{\left(\|u\|_{0}^{2}+1\right)^{1-\theta / 2}}, \quad \nabla^{2} f_{n}(u)=\frac{\theta \sum_{i=1}^{n} e_{i} \otimes e_{i}}{\left(\|u\|_{0}^{2}+1\right)^{1-\theta / 2}}-\frac{\theta(2-\theta) u \otimes u}{\left(\|u\|_{0}^{2}+1\right)^{2-\theta / 2}}, \tag{3.4}
\end{equation*}
$$

and for all $u, v \in \mathbb{H}_{n}^{0}$,

$$
\begin{equation*}
\left|f_{n}(u)-f_{n}(v)\right| \leqslant\left|\left(\|u\|_{0}^{2}+1\right)^{1 / 2}-\left(\|v\|_{0}^{2}+1\right)^{1 / 2}\right|^{\theta} \leqslant\|u-v\|_{0}^{\theta} \tag{3.5}
\end{equation*}
$$

By (3.2), (3.3), (3.4) and Itô's formula (cf. [2, p.226, Theorem 4.4.7]), we have

$$
\begin{aligned}
f_{n}\left(u_{t}^{n}\right)= & f_{n}\left(u_{0}^{n}\right)-\int_{0}^{t} \frac{\theta\left\|\nabla u_{s}^{n}\right\|_{0}^{2}}{\left(\left\|u_{s}^{n}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s+\sum_{j=1}^{n} \int_{0}^{t} \int_{|y| \leqslant 1}\left[f_{n}\left(u_{s}^{n}+y \beta_{j} e_{j}\right)-f_{n}\left(u_{s}^{n}\right)\right] \tilde{N}^{(j)}(\mathrm{d} s, \mathrm{~d} y) \\
& +\sum_{j=1}^{n} \int_{0}^{t} \int_{|y| \leqslant 1}\left[f_{n}\left(u_{s}^{n}+y \beta_{j} e_{j}\right)-f_{n}\left(u_{s}^{n}\right)-\frac{\theta\left\langle u_{s}^{n}, y \beta_{j} e_{j}\right\rangle_{0}}{\left(\left|u_{s}^{n}\right|^{2}+1\right)^{1-\theta / 2}}\right] v(\mathrm{~d} y) \mathrm{d} s \\
& +\sum_{j=1}^{n} \int_{0}^{t} \int_{|y|>1}\left[f_{n}\left(u_{s}^{n}+y \beta_{j} e_{j}\right)-f_{n}\left(u_{s}^{n}\right)\right] N^{(j)}(\mathrm{d} s, \mathrm{~d} y) \\
= & f_{n}\left(u_{0}^{n}\right)-I_{1}^{n}(t)+I_{2}^{n}(t)+I_{3}^{n}(t)+I_{4}^{n}(t)
\end{aligned}
$$

For $I_{2}^{n}(t)$, by Burkholder's inequality and (3.5), we have

$$
\begin{aligned}
\mathbb{E}\left(\sup _{t \in[0, T]} I_{2}^{n}(t)\right) & \leqslant C \sum_{j=1}^{n} \mathbb{E}\left(\int_{0}^{T} \int_{|y| \leqslant 1}\left|f_{n}\left(u_{s}^{n}+y \beta_{j} e_{j}\right)-f_{n}\left(u_{s}^{n}\right)\right|^{2} N^{(j)}(\mathrm{d} s, \mathrm{~d} y)\right)^{1 / 2} \\
& \leqslant C \sum_{j=1}^{n}\left(\mathbb{E} \int_{0}^{T} \int_{|y| \leqslant 1}\left|f_{n}\left(u_{s}^{n}+y \beta_{j} e_{j}\right)-f_{n}\left(u_{s}^{n}\right)\right|^{2} v(\mathrm{~d} y) \mathrm{d} s\right)^{1 / 2} \\
& \leqslant C T^{1 / 2} \sum_{j=1}^{n}\left|\beta_{j}\right|^{\theta}\left(\int_{|y| \leqslant 1}|y|^{2 \theta} v(\mathrm{~d} y)\right)^{1 / 2} \leqslant C T^{1 / 2} \sum_{j=1}^{\infty}\left|\beta_{j}\right|^{\theta}
\end{aligned}
$$

where we have used condition $\left(\mathbf{H}_{\theta}\right)$. Here and after, the constant $C$ is independent of $n, T$. For $I_{3}^{n}(t)$, by Taylor's expansion and (3.4), we have

$$
\mathbb{E}\left(\sup _{t \in[0, T]} I_{3}^{n}(t)\right) \leqslant C \sum_{j=1}^{n} \beta_{j}^{2} \int_{0}^{T} \int_{|y| \leqslant 1}|y|^{2} v(\mathrm{~d} y) \mathrm{d} s \leqslant C T \sum_{j=1}^{\infty}\left|\beta_{j}\right|^{\theta} \int_{|y| \leqslant 1}|y|^{2} v(\mathrm{~d} y)
$$

For $I_{4}^{n}(t)$, by (3.5), we have

$$
\begin{aligned}
\mathbb{E}\left(\sup _{t \in[0, T]} I_{4}^{n}(t)\right) & \leqslant \sum_{j=1}^{n} \mathbb{E}\left(\int_{0}^{T} \int_{|y|>1}\left|f_{n}\left(u_{s}^{n}+y \beta_{j} e_{j}\right)-f_{n}\left(u_{s}^{n}\right)\right| N^{(j)}(\mathrm{d} s, \mathrm{~d} y)\right) \\
& =\sum_{j=1}^{n} \mathbb{E}\left(\int_{0}^{T} \int_{|y|>1}\left|f_{n}\left(u_{s}^{n}+y \beta_{j} e_{j}\right)-f_{n}\left(u_{s}^{n}\right)\right| v(\mathrm{~d} y) \mathrm{d} s\right) \\
& \leqslant C T \sum_{j=1}^{\infty}\left|\beta_{j}\right|^{\theta} \int_{|y|>1}|y|^{\theta} v(\mathrm{~d} y) .
\end{aligned}
$$

Combining the above calculations, we obtain that

$$
\begin{equation*}
\mathbb{E}\left(\sup _{t \in[0, T]}\left(\left\|u_{t}^{n}\right\|_{0}^{2}+1\right)^{\theta / 2}\right)+\mathbb{E} \int_{0}^{T} \frac{\theta\left\|\nabla u_{s}^{n}\right\|_{0}^{2}}{\left(\left\|u_{s}^{n}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s \leqslant\left(\|\varphi\|_{0}^{2}+1\right)^{\theta / 2}+C T+C T^{1 / 2} \tag{3.6}
\end{equation*}
$$

(Step 2): In this step, we use Theorem 2.1 to show that $\left\{\left(u_{t}^{n}\right)_{t \geqslant 0}, n \in \mathbb{N}\right\}$ is tight in $\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{H}^{-1}\right)$. For any $\phi \in C_{0}^{\infty}\left(\mathbb{T}^{2}\right)^{2}$, by equation (3.2), we have

$$
\begin{aligned}
\left\langle u_{t}^{n}, \phi\right\rangle_{-1} & =\left\langle u_{0}^{n}, \phi\right\rangle_{-1}+\int_{0}^{t}\left[\left\langle\Delta u_{s}^{n}, \phi\right\rangle_{-1}-\left\langle\left(u_{s}^{n} \cdot \nabla\right) u_{s}^{n}, \phi\right\rangle_{-1}\right] \mathrm{d} s+\left\langle L_{t}^{n}, \phi\right\rangle_{-1} \\
& =\left\langle u_{0}^{n}, \phi\right\rangle_{-1}+\int_{0}^{t}\left[\left\langle u_{s}^{n}, \Delta \phi\right\rangle_{-1}+\left\langle u_{s}^{n} \otimes u_{s}^{n}, \nabla \phi\right\rangle_{-1}\right] \mathrm{d} s+\left\langle L_{t}^{n}, \phi\right\rangle_{-1}
\end{aligned}
$$

Thus, for $\varepsilon>0$ and any stopping time $\tau$ bounded by $t$, we have

$$
\begin{aligned}
\left\langle u_{\tau+\varepsilon}^{n}-u_{\tau}^{n}, \phi\right\rangle_{-1}= & \int_{\tau}^{\tau+\varepsilon}\left[\left\langle u_{s}^{n}, \Delta \phi\right\rangle_{-1}+\left\langle u_{s}^{n} \otimes u_{s}^{n}, \nabla \phi\right\rangle_{-1}\right] \mathrm{d} s+\left\langle L_{\tau+\varepsilon}^{n}-L_{\tau}^{n}, \phi\right\rangle_{-1} \\
\leqslant & \varepsilon \sup _{s \in[0, t]}\left(\left\|u_{s}^{n}\right\|_{0} \cdot\|\phi\|_{0}+\left\|u_{s}^{n}\right\|_{0}^{2} \cdot\left\|\nabla(-\Delta)^{-1} \phi\right\|_{\infty}\right) \\
& +\sum_{j=1}^{n}\left|\beta_{j}\right| \cdot\left|L_{\tau+\varepsilon}^{(j)}-L_{\tau}^{(j)}\right| \cdot\left\|(-\Delta)^{-1} \phi\right\|_{0}
\end{aligned}
$$

Using $(a+b)^{\theta} \leqslant a^{\theta}+b^{\theta}$ provided that $\theta \in(0,1]$, we get

$$
\mathbb{E}\left|\left\langle u_{\tau+\varepsilon}^{n}-u_{\tau}^{n}, \phi\right\rangle_{-1}\right|^{\theta / 2} \leqslant C_{\phi} \mathbb{E}\left(\sup _{s \in[0, t]}\left\|u_{s}^{n}\right\|_{0}^{\theta}+1\right) \varepsilon^{\theta / 2}+C_{\phi}\left(\mathbb{E} \sum_{j=1}^{n}\left|\beta_{j}\right|^{\theta} \cdot\left|L_{\tau+\varepsilon}^{(j)}-L_{\tau}^{(j)}\right|^{\theta}\right)^{\frac{1}{2}}
$$

By the strong Markov property of Lévy process (cf. [12, p.278, Theorem 40.10]), we have

$$
\mathbb{E}\left|L_{\tau+\varepsilon}^{(j)}-L_{\tau}^{(j)}\right|^{\theta}=\mathbb{E}\left|L_{\varepsilon}^{(j)}\right|^{\theta}=\mathbb{E}\left|L_{\varepsilon}^{(1)}\right|^{\theta}, \forall j \in \mathbb{N}
$$

Thus, by (3.6) and $\left(\mathrm{H}_{\theta}\right)$,

$$
\begin{equation*}
\mathbb{E}\left|\left\langle u_{\tau+\varepsilon}^{n}-u_{\tau}^{n}, \phi\right\rangle_{-1}\right|^{\theta / 2} \leqslant C\left[\varepsilon^{\theta / 2}+\left(\mathbb{E}\left|L_{\varepsilon}^{(1)}\right|^{\theta}\right)^{1 / 2}\right] \tag{3.7}
\end{equation*}
$$

where the constant $C$ is independent of $n, \tau$ and $\varepsilon$. On the other hand, by (2.1), we have

$$
\begin{equation*}
\mathbb{E}\left(\sup _{s \in[0, t]} \sum_{j=m}^{\infty}\left\langle u_{s}^{n}, e_{j}\right\rangle_{-1}^{2}\right)^{\theta / 2}=\mathbb{E}\left(\sup _{s \in[0, t]} \sum_{j=m}^{\infty} \frac{\left\langle u_{s}^{n}, e_{j}\right\rangle_{0}^{2}}{\lambda_{j}^{2}}\right)^{\theta / 2} \leqslant \frac{1}{\lambda_{m}^{\theta}} \mathbb{E}\left(\sup _{s \in[0, t]}\left\|u_{s}^{n}\right\|_{0}^{\theta}\right) \tag{3.8}
\end{equation*}
$$

By Theorem 2.1 and (3.6)-(3.8), one knows that the law of $\left(u_{t}^{n}\right)_{t \geqslant 0}$ in $\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{H}^{-1}\right)$ denoted by $P_{n}$ is tight.
(Step 3): Let $P$ be any accumulation point of $\left\{P_{n}, n \in \mathbb{N}\right\}$. In this step, we show that $P$ is a weak solution of equation (1.1) in the sense of Definition 3.1. First of all, by Skorohod's embedding theorem, there exists a probability space $(\tilde{\Omega}, \tilde{\mathscr{F}}, \tilde{P})$ and $\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{H}^{-1}\right)$-valued random variables $X^{n}$ and $X$ such that
(i) Law of $X^{n}$ under $\tilde{P}$ is $P_{n}$ and law of $X$ under $\tilde{P}$ is $P$.
(ii) $X^{n}$ converges to $X$ in $\mathbb{D}\left(\mathbb{R}_{+} ; \mathbb{H}^{-1}\right)$ a.s. as $n \rightarrow \infty$.

Thus, by (3.6), we have

$$
\begin{equation*}
\tilde{\mathbb{E}}\left(\sup _{t \in[0, T]}\left\|X_{t}^{n}\right\|_{0}^{\theta}\right)+\tilde{\mathbb{E}}\left(\int_{0}^{T} \frac{\theta\left\|\nabla X_{s}^{n}\right\|_{0}^{2}}{\left(\left\|X_{s}^{n}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s\right) \leqslant C\left(1+\|\varphi\|_{0}^{\theta}+T\right) \tag{3.9}
\end{equation*}
$$

By Lemma 2.3 and Fatou's lemma, for any $m \in \mathbb{N}$, we have

$$
\begin{align*}
\mathbb{E}^{P}\left(\sup _{t \in[0, T]}\left\|u_{t}\right\|_{0}^{\theta}\right) & =\tilde{\mathbb{E}}\left(\sup _{t \in[0, T]}\left\|X_{t}\right\|_{0}^{\theta}\right) \leqslant \lim _{n \rightarrow \infty} \tilde{\mathbb{E}}\left(\sup _{t \in[0, T+1 / m]}\left\|X_{t}^{n}\right\|_{0}^{\theta}\right) \\
& \leqslant\left(\|\varphi\|_{0}^{2}+1\right)^{\theta / 2}+C(T+1 / m)+C(T+1 / m)^{1 / 2} . \tag{3.10}
\end{align*}
$$

On the other hand, for any $\delta \in(0, \theta / 4)$, by Hölder's inequality and (3.9), we have

$$
\begin{aligned}
\tilde{\mathbb{E}}\left(\int_{0}^{T}\left\|X_{s}^{n}-X_{s}\right\|_{0}^{\delta} \mathrm{d} s\right) & \leqslant \tilde{\mathbb{E}}\left(\int_{0}^{T}\left\|X_{s}^{n}-X_{s}\right\|_{-1}^{\delta / 2}\left\|X_{s}^{n}-X_{s}\right\|_{1}^{\delta / 2} \mathrm{~d} s\right) \\
& \leqslant\left(\tilde{\mathbb{E}} \int_{0}^{T}\left\|X_{s}^{n}-X_{s}\right\|_{-1}^{\delta} \mathrm{d} s\right)^{1 / 2}\left(\tilde{\mathbb{E}} \int_{0}^{T}\left\|X_{s}^{n}-X_{s}\right\|_{1}^{\delta} \mathrm{d} s\right)^{1 / 2} \rightarrow 0
\end{aligned}
$$

So, there exists a subsequence still denoted by $n$ such that for $\tilde{P} \times \mathrm{d} t$-almost all $(\omega, s), X_{s}^{n}(\omega)$ converges to $X_{s}(\omega)$ in $\mathbb{H}^{0}$. By Lemma 2.3 and (3.9), we then obtain

$$
\begin{align*}
\mathbb{E}^{P}\left(\int_{0}^{T} \frac{\theta\left\|\nabla u_{s}\right\|_{0}^{2}}{\left(\left\|u_{s}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s\right) & =\tilde{\mathbb{E}}\left(\int_{0}^{T} \frac{\theta\left\|\nabla X_{s}\right\|_{0}^{2}}{\left(\left\|X_{s}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s\right) \\
& \leqslant \underset{n \rightarrow \infty}{\lim _{n \rightarrow \infty}} \tilde{\mathbb{E}}\left(\int_{0}^{T} \frac{\theta\left\|\nabla X_{s}^{n}\right\|_{0}^{2}}{\left(\left\|X_{s}^{n}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s\right) \\
& \leqslant C\left(1+\|\varphi\|_{0}^{\theta}+T\right) . \tag{3.11}
\end{align*}
$$

Combining (3.10) and (3.11) gives (1.2). In particular, $\sup _{t \in[0, T]}\left\|u_{t}\right\|_{0}$ and $\int_{0}^{T} \frac{\theta\left\|\nabla u_{s}\right\|_{0}^{2}}{\left(\left\|u_{s}\right\|_{0}^{2}+1\right)^{1-\theta / 2}} \mathrm{~d} s$ are finite $P$-almost surely, which produces (i) of Definition 3.1.
Fixing $j \in \mathbb{N}$, in order to show that $M_{t}^{(j)}$ defined by (3.1) is a Lévy process, we only need to prove that for any $0 \leqslant s<t$,

$$
\begin{equation*}
\mathbb{E}^{P} e^{\mathrm{i} \xi\left(M_{t}^{(j)}-M_{s}^{(j)}\right)}=\tilde{\mathbb{E}} e^{\mathrm{i} \xi\left(\tilde{M}_{t}^{(j)}-\tilde{M}_{s}^{(j)}\right)}=\exp \left\{(t-s) \int_{\mathbb{R} \backslash\{0\}}\left(e^{\mathrm{i} \xi y \beta_{j}}-1-1_{|y| \leqslant 1} \mathrm{i} \xi y \beta_{j}\right) v(\mathrm{~d} y)\right\} \tag{3.12}
\end{equation*}
$$

where

$$
\tilde{M}_{t}^{(j)}:=\left\langle X_{t}, e_{j}\right\rangle_{0}-\left\langle X_{0}, e_{j}\right\rangle_{0}-\int_{0}^{t}\left[\left\langle X_{r}, \Delta e_{j}\right\rangle_{0}+\left\langle X_{r} \otimes X_{r}, \nabla e_{j}\right\rangle_{0}\right] \mathrm{d} r
$$

Fix $0 \leqslant s<t$ below. By Theorem 2.2, there exists $\left(s_{n}, t_{n}\right) \downarrow(s, t)$ such that

$$
\lim _{n \rightarrow \infty} \tilde{\mathbb{E}} e^{\mathrm{i} \xi\left\langle X_{t_{n}}^{n}, e_{j}\right\rangle_{0}}=\tilde{\mathbb{E}} e^{\mathrm{i} \xi\left\langle X_{t}, e_{j}\right\rangle_{0}}, \quad \lim _{n \rightarrow \infty} \tilde{\mathbb{E}} e^{\mathrm{i} \xi\left\langle X_{s_{n}}^{n}, e_{j}\right\rangle_{0}}=\tilde{\mathbb{E}} e^{\mathrm{i} \xi\left\langle X_{s}, e_{j}\right\rangle_{0}} .
$$

By equation (3.2), it is well-known that for any $n \geqslant j$,

$$
\begin{aligned}
& \tilde{\mathbb{E}} \exp \left\{\mathrm{i} \xi\left[\left\langle X_{t_{n}}^{n}-X_{s_{n}}^{n}, e_{j}\right\rangle_{0}-\int_{s_{n}}^{t_{n}}\left[\left\langle X_{r}^{n}, \Delta e_{j}\right\rangle_{0}+\left\langle X_{r}^{n} \otimes X_{r}^{n}, \nabla e_{j}\right\rangle_{0}\right] \mathrm{d} r\right]\right\} \\
& \quad=\mathbb{E}^{P_{n}} \exp \left\{\mathrm{i} \xi\left[\left\langle u_{t_{n}}^{n}-u_{s_{n}}^{n}, e_{j}\right\rangle_{0}-\int_{s_{n}}^{t_{n}}\left[\left\langle u_{r}^{n}, \Delta e_{j}\right\rangle_{0}+\left\langle u_{r}^{n} \otimes u_{r}^{n}, \nabla e_{j}\right\rangle_{0}\right] \mathrm{d} r\right]\right\}
\end{aligned}
$$

$$
=\exp \left\{\left(t_{n}-s_{n}\right) \int_{\mathbb{R} \backslash\{0\}}\left(e^{\mathrm{i} \xi y \beta_{j}}-1-1_{|y| \leqslant 1} \mathrm{i} \xi y \beta_{j}\right) v(\mathrm{~d} y)\right\} .
$$

Thus, for proving (3.12), it suffices to prove the following limits:

$$
\begin{aligned}
& \lim _{n \rightarrow \infty} \tilde{\mathbb{E}}\left|\exp \left\{\mathrm{i} \xi \int_{s}^{t}\left\langle X_{r}^{n} \otimes X_{r}^{n}, \nabla e_{j}\right\rangle_{0} \mathrm{~d} r\right\}-\exp \left\{\mathrm{i} \xi \int_{s}^{t}\left\langle X_{r} \otimes X_{r}, \nabla e_{j}\right\rangle_{0} \mathrm{~d} r\right\}\right|=0, \\
& \lim _{n \rightarrow \infty} \tilde{\mathbb{E}}\left|\exp \left\{\mathrm{i} \xi \int_{s}^{t}\left\langle X_{r}^{n}, \Delta e_{j}\right\rangle_{0} \mathrm{~d} r\right\}-\exp \left\{\mathrm{i} \xi \int_{s}^{t}\left\langle X_{r}, \Delta e_{j}\right\rangle_{0} \mathrm{~d} r\right\}\right|=0, \\
& \lim _{n \rightarrow \infty} \tilde{\mathbb{E}}\left|\exp \left\{\mathrm{i} \xi \int_{s_{n}}^{t_{n}}\left\langle X_{r}^{n} \otimes X_{r}^{n}, \nabla e_{j}\right\rangle_{0} \mathrm{~d} r\right\}-\exp \left\{\mathrm{i} \xi \int_{s}^{t}\left\langle X_{r}^{n} \otimes X_{r}^{n}, \nabla e_{j}\right\rangle_{0} \mathrm{~d} r\right\}\right|=0, \\
& \lim _{n \rightarrow \infty} \tilde{\mathbb{E}}\left|\exp \left\{\mathrm{i} \xi \int_{s_{n}}^{t_{n}}\left\langle X_{r}^{n}, \Delta e_{j}\right\rangle_{0} \mathrm{~d} r\right\}-\exp \left\{\mathrm{i} \xi \int_{s}^{t}\left\langle X_{r}^{n}, \Delta e_{j}\right\rangle_{0} \mathrm{~d} r\right\}\right|=0 .
\end{aligned}
$$

Let us only prove the first limit, the others are similar. Noticing that for any $\delta \in(0,1)$ and $a, b \in \mathbb{R}$,

$$
\left|e^{\mathrm{i} a}-e^{\mathrm{i} b}\right| \leqslant 2(|a-b| \wedge 1) \leqslant 2|a-b|^{\delta}
$$

by Hölder's inequality and $\|u\|_{0} \leqslant\|u\|_{-1}^{1 / 2}\|u\|_{1}^{1 / 2}$, we have for $\delta<\theta / 4$,

$$
\begin{aligned}
& \tilde{\mathbb{E}}\left|\exp \left\{\mathrm{i} \xi \int_{s}^{t}\left\langle X_{r}^{n} \otimes X_{r}^{n}, \nabla e_{j}\right\rangle_{0} \mathrm{~d} r\right\}-\exp \left\{\mathrm{i} \xi \int_{s}^{t}\left\langle X_{r} \otimes X_{r}, \nabla e_{j}\right\rangle_{0} \mathrm{~d} r\right\}\right| \\
& \leqslant\left. 2|\xi|^{\delta} \tilde{\mathbb{E}} \int_{s}^{t}\left\langle X_{r}^{n} \otimes X_{r}^{n}-X_{r} \otimes X_{r}, \nabla e_{j}\right\rangle_{0} \mathrm{~d} r\right|^{\delta} \\
& \leqslant C \tilde{\mathbb{E}}\left(\int_{s}^{t}\left\|X_{r}^{n}-X_{r}\right\|_{0}\left(\left\|X_{r}^{n}\right\|_{0}+\left\|X_{r}\right\|_{0}\right) \mathrm{d} r\right)^{\delta} \\
& \leqslant C \tilde{\mathbb{E}}\left(\sup _{r \in[s, t]}\left(\left\|X_{r}^{n}\right\|_{0}+\left\|X_{r}\right\|_{0}\right) \int_{s}^{t}\left\|X_{r}^{n}-X_{r}\right\|_{-1}^{1 / 2}\left\|X_{r}^{n}-X_{r}\right\|_{1}^{1 / 2} \mathrm{~d} r\right)^{\delta} \\
& \leqslant C \tilde{\mathbb{E}}\left(\sup _{r \in[s, t]}\left(\left\|X_{r}^{n}\right\|_{0}+\left\|X_{r}\right\|_{0}+1\right)^{2 \delta-(\theta \delta / 2)}\left(\int_{s}^{t}\left\|X_{r}^{n}-X_{r}\right\|_{-1} \mathrm{~d} r\right)^{\delta / 2}\right. \\
& \times\left(\int_{s}^{t} \frac{\left(\left\|X_{r}^{n}\right\|_{1}+\left\|X_{r}\right\|_{1}\right)}{\left.\left.\left.\left(\left\|X_{r}^{n}\right\|_{0}^{2}+\left\|X_{r}\right\|_{0}^{2}+1\right)^{1-\theta / 2} \mathrm{~d} r\right)^{\delta / 2}\right)^{2 \delta}\right]^{1 / 4} \rightarrow 0}\right. \\
& \leqslant C\left[\tilde{\mathbb{E}}\left(\int_{s}^{t}\left\|X_{r}^{n}-X_{r}\right\|_{-1} \mathrm{~d} r\right)^{2}\right]^{2}
\end{aligned}
$$

as $n \rightarrow \infty$, where in the last inequality, we have used (3.9) and Hölder's inequality. As for the independence of $M^{(j)}$ for different $j \in \mathbb{N}$, it can be proved in a similar way.

Proof of Theorem 1.1: The pathwise uniqueness follows by the classical result for 2D deterministic Navier-Stokes equation. As for the existence of invariant measures, basing on (1.2) (see Remark 1.3), it follows by the classical Bogoliubov-Krylov's argument.
