# INVARIANTS OF FINITE GROUPS GENERATED BY PSEUDO-REFLECTIONS IN POSITIVE CHARACTERISTIC 

By<br>Haruhisa Nakajima

## Introduction

Let $R$ be a commutative ring, and let $V$ be a finitely generated free $R$-module. Let $R[V]$ be a polynomial ring over $R$ associated with $V$. Then a finite subgroup $G$ of $G L(V)$ acts naturally on $R[V]$. We denote by $R[V]^{G}$ the ring of invariants of $R[V]$ under the action of $G$.

Let $R=k$ be a field and suppose that $|G|$ is a unit of $k$. It is known ([4], [9], [3], [8]) that $k[V]^{G}$ is a polynomial ring if and only if $G$ is generated by pseudoreflections in $G L(V)$.

But, in the case where $|G| \equiv 0 \bmod \operatorname{char}(k)$, there are only the following results:
(1) L. E. Dickson [5]; $\boldsymbol{F}_{q}\left[T_{1}, \cdots, T_{n}\right]^{G L(n, q)}$ and $\boldsymbol{F}_{q}\left[T_{1}, \cdots, T_{n}\right]^{S L(n, q)}$ are polynomial rings, where $\boldsymbol{F}_{q}$ is the finite field of $q$ elements.
(2) M.-J. Bertin [1]; $\boldsymbol{F}_{q}\left[T_{1}, \cdots, T_{n}\right]^{U n i p(n, q)}$ is a polynomial ring, where

$$
\operatorname{Unip}(n, q)=\left\{\sigma \in G L(n, q): \sigma=\left[\begin{array}{llll}
1 & & & \\
& \cdot & & \\
* & & \cdot & \\
* & & & 1
\end{array}\right]\right\} .
$$

(3) J.-P. Serre [8]; (i) If $k[V]^{G}$. is a polynomial ring, then $G$ is generated by pseudo-reflections in $G L(V)$. (ii) $\boldsymbol{F}_{q}\left[T_{1}, T_{2}, T_{3}, T_{4}\right]_{4}^{0+\left(F_{q}\right)}$ is not a polynomial ring, where $O_{4}^{+}\left(\boldsymbol{F}_{q}\right)$ is the orthogonal group and $\operatorname{char}\left(\boldsymbol{F}_{q}\right) \neq 2$.

The purpose of this paper is to determine finite irreducible subgroups $G$ of $G L(V)$ such that $k[V]^{G}$ are polynomial rings in the case where $|G| \equiv 0 \bmod \operatorname{char}(k)$. Let $V$ be an $n$-dimensional vector space over a finite field $k$ of characteristic $p$ and let $G$ be a subgroup of $G L(V)$. Then our results are the following
[ I ] If $G$ is a transitive imprimitive group generated by pseudo-reflections, then $k[V]^{G}$ is a polynomial ring.
[II] Suppose that $p \neq 2, n \geqq 3$ and $G$ is an irreducible group generated by transvections. Then $k[V]^{G}$ is a polynomial ring if and only if $G$ is conjugate in $G L(V)$
to $S L(n, q)$.
[III] Suppose that $p \neq 2$ and $V$ is a faithful linear representation of least degree of the symmetric group $S_{m}$ of degree $m$ with $m \geqq 7$. Then $k[V]^{s_{n}}$ is a polynomial ring if and only if $(m, p)=1$ and all transpositions of $S_{m}$ are represented by reflections in $G L(V)$.
[IV] Let $F$ be a subfield of $k$ and let $O_{n}(F)$ be the orthogonal group of dimension $n$ over $F$. Suppose that $G$ is a subgroup of $O_{n}(F)$ which contains the commutator subgroup $\Omega_{n}(F)$ of $O_{n}(F)$. If $n \geqq 4$, then $k[V]^{G}$ is not a polynomial ring.

Let $G \subseteq G L(V)$ be an irreducible primitive group and let $p \neq 2$. If $G$ is generated by transvections, $G$ is called a transvection group. Transvection groups are classified by A.E. Zalesskii and V.N. Serezkin [11]. This result will be used in the proof of [II]. On the other hand $G$ is called a reflection group if $G$ is a group generated by reflections which contains no transvections. By using the classification stated in V.N. Serezkin [7], we can determine all reflection groups $G$ such that $k[V]^{G}$ are polynomial rings under the assumption of $n \geqq 4, p>7$. For convenience we will describe their results in $\S 1$.

## § 1. Preliminaries

Let $V$ be a vector space over a field $k$. According to [2], an element $\sigma \in G L(V)$ is called a pseudo-reflection in $V$ if $\operatorname{dim} V_{o} \leqq 1$ where $V_{\sigma}=(1-\sigma) V$.

On the other hand an automorphism $\sigma$ of an integral domain $R$ is called a generalized reflection in $R$ if ( $\sigma-1) R \subseteq p$ for some prime ideal $\mathfrak{p}$ of $R$ of height 1 . For a subgroup $G$ of $\operatorname{Aut}(R)$ and a prime ideal $\mathfrak{p}$ of $R$, we put $D_{G}(\mathfrak{p})=\{\sigma \in G: \sigma(\mathfrak{p})=$ p) (resp. $\left.I_{G}(\mathfrak{p})=\{\sigma \in G:(\sigma-1) R \cong \mathfrak{p}\}\right)$ which is called the decomposition group of $G$ at $\mathfrak{p}$ (resp. the inertia group of $G$ at $\mathfrak{p}$ ).

Let $R=\bigoplus_{i=0}^{\infty} R_{i}$ be a graded algebra over $R_{0}$ with a graduation $\left\{R_{i}\right\}$. We define that

$$
\begin{aligned}
\Lambda u t_{g r}(R) & =\{\sigma \in A u t(R): \sigma \text { preserves the graduation of } R\}, \\
A u t_{R_{0}-g r}(R) & =\left\{\sigma \in A u t_{g r}(R): \sigma \text { acts trivially on } R_{0}\right\}, \\
R_{+} & =\underset{i>0}{\oplus} R_{i} .
\end{aligned}
$$

Theorem 1.1. ([8]) Let $R$ be a regular local ring with the residue class field $k$. Let $G$ be a finite subgroup of $\operatorname{Aut}(R)$ such that $|G| \cdot 1_{R} \in U(R)$ and $k^{G}=k$, where $U(R)$ denotes the unit group of $R$. Then $R^{G}$ is a regular local ring if and only if $G$ is generated by generalized reflections.

The following lemma is well known.

Lemma 1.2. Let $R$ be a noetherian graded algebra over a field $k$. Then the following conditions are equivalent:
(1) $R$ is a graded polynomial algebra over $k$.
(2) $R_{R_{+}}$is a regular local ring.

For an element $\sigma$ of $\operatorname{Aut}(R)$ and a $\sigma$-stable prime ideal $\mathfrak{p}, \sigma$ induces an element of $A u t\left(R_{v}\right)$ which is denoted by the same symbol $\sigma$. Let $R=\bigoplus_{i=0}^{\infty} R_{i}$ be a noetherian graded polynomial algebra over a field $R_{0}=k$. Then, for $\sigma \in A u t_{k-g r}(R), \sigma$ is a generalized reflection in $R$ if and only if $\sigma$ is so in $R_{R_{+}}$. Therefore, from (1.1), we obtain

Corollary 1.3. Let $R=\bigoplus_{i=0}^{\infty} R_{i}$ be a noetherian graded polynomial algebra over a field $R_{0}=k$, and let $G$ be a finite subgroup of $\operatorname{Aut}_{k-g r}(R)$ such that $|G| \cdot 1_{k} \in U(k)$. Then $R^{G}$ is a graded polynomial algebra over $k$ if and only if $G$ is generated by generalized reflections.

Lemma 1.4. (e.g. [2]) Suppose that $R=k\left[T_{1}, \cdots, T_{n}\right]$ is a polynomial ring over an algebraically closed field $k$ and that $G$ is a finite subgroup of $G L_{n}(k)$. If $R^{G}$ is a polynomial ring, then $R^{D_{G}(\mathfrak{m})}$ is a polynomial ring for any maximal ideal $\mathfrak{n t}$ of $R$ and $D_{G}(\mathfrak{m})$ is generated by pseudo-reflections.

Proof. $\operatorname{dim}\left(R_{\mathrm{m}}^{D_{G}(\mathrm{~m})}\right)=\operatorname{dim}\left(\left(R^{G}\right)_{\mathrm{m} \cap R^{G}}\right)$ and $R_{\mathrm{m}^{\mathrm{m}^{( }}{ }^{(\mathrm{mm})} \text { is unramified over }\left(R^{G}\right)_{\mathrm{m} \cap R^{G}} .}$. Hence $R_{\mathfrak{m}}{ }^{D_{G}(\mathrm{~m})}$ is a regular local ring. Since $\mathfrak{m}$ is $D_{G}(\mathfrak{m})$-stable,

$$
R_{\mathrm{m}} D_{G^{(m)}}=\left(R^{D_{G}(\mathrm{~m})}\right)_{\mathrm{m} \cap R^{D_{G}}{ }^{(\mathrm{m})}} .
$$

On the other hand there exist elements $a_{i} \in k(1 \leqq i \leqq n)$ such that $\mathfrak{m}=\left(T_{1}-a_{1}, \cdots, T_{n}-\right.$ $\left.a_{n}\right)$. Put $X_{i}=T_{i}-a_{i}(1 \leqq i \leqq n)$ and regard $R=k\left[X_{1}, \cdots, X_{n}\right]$ as a graded algebra by $\operatorname{deg} X_{i}=1$. Then $D_{G}(\mathfrak{m}) \cong A u t_{k-g r}(R)$ and $R_{+}=\mathfrak{m}$. Therefore $S=R^{D_{G}(m)}$ is a graded subalgebra of $R$ and $S_{+}=\mathfrak{n} \cap R^{D_{G}(\mathfrak{m})}$. Since $S_{S_{+}}$is a regular local ring, $S$ is a polynomial ring over $k$ by (1.2). Hence $D_{G}(\mathfrak{m})$ is generated by pseudo-reflections.

From here to the end of this section, we assume that $V$ is an $n$-dimensional vector space over a finite field $k$ of characteristic $p \neq 2$. A pseudo-reflection $\sigma \neq 1$ is called a transvection if $\sigma \mid V_{\sigma}=1$ and a reflection if $\sigma \mid V_{\sigma}=-1$. Let $G$ be a subgroup of $G L(V)$. Then we use the following notation:

$$
\begin{aligned}
& P(G)=\{\sigma \in G: \sigma \text { is a pseudo reflection }\}, \\
& T(G)=\{\sigma \in G: \sigma \text { is a transvection }\} \\
& R(G)=\{\sigma \in G: \sigma \text { is a reflection }\}
\end{aligned}
$$

A. E. Zalesskii and V.N. Serezkin obtained the following result which gives the classification of transvection groups.

Theorem 1.6. ([11]) Suppose that $G \cong G L(V)(n \geqq 2)$ is a transvection group. Then $G$ is conjugate in $G L(V)$ to one of the groups $S L(n, q), S p(n, q)$ or $\operatorname{SU}(n, q)$, except for the case where $G \cong S L(2,5), G \cong S L\left(2,3^{2}\right)$.

Recently V. N. Serezkin obtained the following
Theorem 1.7. ([6], [7]) Suppose $n>3, p>5$. Let $G \cong G L(V)$ be a reflection group. Then $G$ is conjugate in $G L(V)$ to one of the groups in the following list:
(1) The orthogonal groups $O_{2 m+1}(F), O_{2 m}^{ \pm}(F)$, where $F$ is a subfield of $k$ and $n=2 m+1,2 m$ respectively, or the groups $x \cdot \Omega$, where $x \in R\left(O_{n}(F)\right)$ and $\Omega$ is the commutator subgroup of the orthogonal group $O_{n}(F)$.
(2) The symmetric groups $S_{n+1}$ where $n+1 \neq 0$ mod $p$, and $S_{n+2}$ where $n+2 \equiv 0$ $\bmod p$.
(3) The nine exceptional groups, namely,
$W\left(F_{4}\right), W\left(N_{4}\right), E W\left(N_{4}\right), W\left(H_{4}\right)$ where $n=4 ; W\left(K_{5}\right)$ where $n=5$;
$W\left(K_{6}\right), W\left(E_{6}\right)$ where $n=6 ; W\left(E_{7}\right)$ where $n=7 ; W\left(E_{8}\right)$ where $n=8$.
However the complete proof of this result has not been published yet.
For a field $k$ of characteristic $p>7$, the orders of the groups in part (3) of (1.7) are units in $k$.

## § 2. Monomial groups

Let $V$ be a finitely generated free module over a commutative ring $R$. A subgroup $G$ of $G L(V)$ is said to be monomial if $G$ has a monomial form on some $R$-basis of $V$ [12], §43). For a field $k$, if $G \cong G L_{n}(k)$ is a finite transitive imprimitive group generated by pseudo-reflections, then $G$ is a monomial group.

In this section, we use the following notation.
Notation 2.1. Let $R$ be an integral domain and $k$ be the quotient field of $R$. Put

$$
\begin{aligned}
& I_{n}(R)=\left\{\sigma \in G L_{n}(R): \sigma \text { is a permutation matrix }\right\} \\
& D_{n}(R)=\left\{\sigma \in G L_{n}(R): \sigma \text { is diagonal }\right\}
\end{aligned}
$$

For a finite subgroup $G$ of $G L_{n}(R)$ of monomial form, the sequence $1 \rightarrow D(G) \rightarrow G \rightarrow$ $I_{n}(R)$ is exact, where $\Delta: G \rightarrow I I_{n}(R)$ is the canonical homomorphism and $D(G)=$ $D_{n}(R) \cap G$. Let

$$
\tilde{P}(G)=\left\{\sigma \in G: \sigma \text { is a pseudo-reflection in } G L_{n}(k)\right\} .
$$

We identify $S_{n}$ with $\Pi_{n}(R)$.
Lemma 2.2. Let $G \subseteq G L_{n}(R)$ be a finite subgroup of monomial form generated by pseudo-reflections in $G L_{n}(k)$. Assume that the following conditions are satisfied:
(1) The sequence $1 \rightarrow D(G) \rightarrow G \rightarrow \Pi_{n}(R) \rightarrow 1$ is exact and $\Pi_{n}(R)$ is contained in G.
(2) $\tilde{P}(D(G))=\left\{E_{n}\right\}$.

Then $R\left[T_{1}, \cdots, T_{n}\right]^{G}$ is a polynomial ring.
Proof. For $r \in \tilde{P}(G)-\left\{E_{n}\right\}$, there exists $\tau_{r} \in \Pi_{n}(R)$ such that $\tau_{r}{ }^{-1} \Delta(r) r_{\tau} \in H=$ $\operatorname{diag}\left[D_{2}(R), 1_{n-2}\right]$ where $\operatorname{diag}\left[D_{2}(R), 1_{n-2}\right]=\left\{\operatorname{diag}\left[\sigma, 1_{n-2}\right]: \sigma \in D_{2}(R)\right\}$. For matrices $A, B, C, \cdots, \operatorname{diag}[A, B, C, \cdots]$ means the block diagonal matrix defined canonically. Put $L=\left\{\tau_{r}^{-1} \Delta(r) r \tau_{r}: r \in \tilde{P}(G)-\left\{E_{n}\right\}\right\} \cup\left\{E_{n}\right\}$. Then $L$ is a subgroup of $H$ and there is a monomorphism from $L$ into $U(R)$. Hence $L$ is generated by $\sigma_{1}=\operatorname{diag}\left[a, a^{-1}, 1_{n-2}\right]$. Let $\sigma_{2}=\operatorname{diag}\left[a, 1, a^{-1}, 1_{n-3}\right], \cdots, \sigma_{n-1}=\operatorname{diag}\left[a, 1_{n-2}, a^{-1}\right]$ and put $m=|\langle a\rangle|$. It is easy to show that $D(G)=\left\langle\sigma_{1}, \sigma_{2}, \cdots, \sigma_{n-1}\right\rangle$. Since any monomial of $R\left[T_{1}, \cdots, T_{n}\right]$ is a semiinvariant of $D(G)$, we have $R\left[T_{1}, \cdots, T_{n}\right]^{D(G)}=R\left[T_{1}{ }^{m}, \cdots, T_{n}{ }^{m}, \prod_{i=1}^{n} T_{i}\right]$. Let $S=$ $R\left[T_{1}, \cdots, T_{n}\right]^{D(G)}, \tilde{S}=R\left[T_{1}{ }^{m}, \cdots, T_{n}{ }^{m}\right], U=\prod_{i=1}^{n} T_{i}, X_{i}=T_{i}{ }^{m}(1 \leqq i \leqq n) . \quad$ Then $S=\widetilde{S} \oplus \tilde{S} U \oplus$ $\cdots \oplus \tilde{S} U^{m-1}$ and $G / D(G)$ acts on $S$ as permutations of $\left\{X_{1}, \cdots, X_{n}\right\}$. Let $U_{i}(1 \leqq i \leqq n-1)$ be the fundamental symmetric polynomial of degree $i$ in $R\left[X_{1}, \cdots, X_{n}\right]$. Then we must have $R\left[T_{1}, \cdots, T_{n}\right]^{G}=R\left[U_{1}, \cdots, U_{n-1}, U\right]$.

Lemma 2.3. Let $V=\oplus_{i=1}^{n} R Y_{i}$ be a free $R$-module and let $G$ be a finite subgroup of $G L(V)$ generated by the set $\tilde{P}(G)$ such that $G$ has a monomial form on the basis $\left\{Y_{1}, \cdots, Y_{n}\right\}$. Then there is an $R$-basis $\left\{X_{1}, \cdots, X_{n}\right\}$ of $V$ such that the following conditions are satisfied:
(1) $G$ has a monomial form on the basis $\left\{X_{1}, \cdots, X_{n}\right\}$.

We regard $G$ as a subgroup of $G L_{n}(R)$ afforded by $\left\{X_{1}, \cdots, X_{n}\right\}$. Let $\Delta: G \rightarrow \Pi_{n}(R)$ be the canonical homomorphism.
(2) There exists a canonical isomorphism $H \cong I I_{n_{1}}(R) \times \cdots \times \Pi_{n_{s}}(R)$, where $H=$ $\operatorname{Im}(\Delta)$ and $\sum_{i=1}^{s} n_{i}=n$.
(3) $H$ is contained in $G$.

Proof. We identify $G$ with the image of the matrix representation of $G$ afforded by the $R$-basis $\left\{Y_{1}, \cdots, Y_{n}\right\}$. Let $H^{\prime}$ be the image of the canonical homomorphism $\Delta^{\prime}: G \rightarrow \Pi_{n}(R)$. Since $G$ is generated by the set $\tilde{P}(G)$, we may assume that $H^{\prime}=$ $H_{1} \times \cdots \times H_{s}$ where

$$
\begin{aligned}
& H_{1}=\operatorname{diag}\left[\Pi_{n_{1}}(R), 1_{n-n_{1}}\right], \quad H_{2}=\operatorname{diag}\left[1_{n_{1}}, \Pi_{n_{2}}(R), 1_{n-n_{1}-n_{2}}\right], \\
& \cdots, H_{s}=\operatorname{diag}\left[1_{n-n_{s}}, \Pi_{n_{s}}(R)\right] .
\end{aligned}
$$

$$
\begin{aligned}
& \Delta^{\prime-1}((1,2)) \cap \tilde{P}(G) \ni \sigma_{1}^{(1)}, \cdots, \Delta^{\prime-1}\left(\left(1, n_{1}\right)\right) \cap \tilde{P}(G) \ni \sigma_{n_{1}-1}^{(1)}, \\
& \Delta^{\prime-1}\left(\left(n_{1}+1, n_{1}+2\right)\right) \cap \tilde{P}(G) \ni \sigma_{1}^{(2)}, \cdots, \\
& \Delta^{\prime-1}\left(\left(n_{1}+1, n_{1}+n_{2}\right)\right) \cap \tilde{P}(G) \ni \sigma_{n_{2}-1}^{(2)}, \\
& \quad \quad \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \\
& \Delta^{\prime-1}\left(\left(\sum_{i=1}^{s-1} n_{i}+1, \sum_{i=1}^{s-1} n_{i}+2\right)\right) \cap \tilde{P}(G) \ni \sigma_{1}^{(s)}, \cdots, \\
& \Delta^{\prime-1}\left(\left(\sum_{i=1}^{s-1} n_{i}+1, n\right)\right) \cap \tilde{P}(G) \ni \sigma_{n_{s}-1}^{(s)} .
\end{aligned}
$$

Put

$$
\begin{aligned}
& X_{1}=Y_{1}, X_{2}=Y_{1}^{\sigma_{1}(1)}, \cdots, X_{n_{1}}=Y_{1}^{\sigma_{n}(1)-1}, \\
& X_{n_{1}+1}^{(1)}=Y_{n_{1}+1}, X_{n_{1}+2}=Y_{n_{1}+1}^{\sigma_{1}^{(2)}}, \cdots, X_{n_{1}+n_{2}}=Y_{n_{1}+1}^{\sigma_{n+1}^{(2)}}, \\
& \quad \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots
\end{aligned}
$$

Then $\left\{X_{1}, \cdots, X_{n}\right\}$ is the $R$-basis of $V$ such that the conditions stated in this lemma are satisfied.

Theorem 2.4. Let $G$ be a finite monomial subgroup of $G L_{n}(R)$ generated by pseudo-reflections in $G L_{n}(k)$. Then $R\left[T_{1}, \cdots, T_{n}\right]^{G}$ is a polynomial ring over $R$.

Proof. By (2.3), we may assume that $G$ is indecomposable in $G L_{n}(R)$. Hence $G$ contains the group $\Pi_{n}(R)$. Since $H=\langle\tilde{P}(D(G))\rangle$ is a normal subgroup of $G$, there is an integer $m$ such that $R\left[T_{1}, \cdots, T_{n}\right]^{H}=R\left[T_{1}{ }^{m}, \cdots, T_{n}{ }^{m}\right] . \quad G / H$ acts $R$-linealy on $\sum_{i=1}^{n} R X_{i}$ and $G / H$ has a monomial form on the basis $\left\{X_{1}, \cdots, X_{n}\right\}$, where $X_{i}=T_{i}^{m}(1 \leqq$ $i \leqq n)$. If we regard $G$ as a subgroup of $G L_{n}(R)$, then the sequence $1 \rightarrow D(G / H) \rightarrow$ $G / H \rightarrow \Pi_{n}(R) \rightarrow 1$ is exact and $\Pi_{n}(R)$ is contained in $G / H$. If $\widetilde{P}(D(G / H)) \neq\left\{E_{n}\right\}$, we continue this procedure. So we may assume that $\tilde{P}(D(G / H))=\left\{E_{n}\right\}$. In this case, by (2.2), $R\left[X_{1}, \cdots, X_{n}\right]^{G / H}$ is a polynomial ring over $R$.

## § 3. Unipotent abelian groups

We will consider about invariants of subgroups of the group:

$$
A(m, n: q)=\left\{\left[\begin{array}{cc}
E_{m} & 0 \\
M & E_{n}
\end{array}\right]: \quad M \in \operatorname{Mat}_{n \times m}\left(\boldsymbol{F}_{q}\right)\right\} .
$$

We preserve the following notation in this section.
Notation 3.1. Let $k=\boldsymbol{F}_{q}$ where $q=p^{f}$ and $p$ is a prime. Let

$$
\sigma=\left[\begin{array}{cc}
E_{m} & 0 \\
M & E_{n}
\end{array}\right], \quad M=\left[\mu_{1} \cdots \mu_{m}\right]
$$

where $\mu_{i}(1 \leqq i \leqq m)$ are column vectors. If $\sigma \neq 1$, we put $\varphi(\sigma)=\mu_{i_{0}}$ where $i_{0}=\min \{i$ : $\left.\mu_{i} \neq 0\right\}$. And if $\sigma=1$, put $\varphi(\sigma)=0$. For a subgroup $G$ of the group $A(m, n: q)$, set $d(G)=\operatorname{dim}_{k}\langle\varphi(P(G))\rangle_{k}$, where $\langle\varphi(P(G))\rangle_{k}$ is the subspace of the column vector space $k^{n}$ spanned by the set $\varphi(P(G))$. The group $A(m, n: q)$ acts linearly on the polynomial ring $S=k\left[X_{1}, \cdots, X_{m}, Y_{1}, \cdots, Y_{n}\right]$ in the form that for $\sigma=\left[\sigma_{i j}\right] \in A(m, n: q)$

$$
\left(\left[X_{1}, \cdots, X_{m}, Y_{1}, \cdots, Y_{n}\right]\right)^{\sigma}=\left[\sigma_{i j}\right]^{t}\left[X_{1}, \cdots, X_{m}, Y_{1}, \cdots, Y_{n}\right] .
$$

Lemma 3.2. Let $G$ be a subgroup of $A(m, n: q)$ generated by pseudo-reflections. Then there exists an element $\delta \in G L(n, q)$ such that $Z_{i} \in S^{G}(d(G)<i \leqq n)$ where

$$
t\left[Z_{1}, \cdots, Z_{n}\right]=\delta^{t}\left[Y_{1}, \cdots, Y_{n}\right] .
$$

Proof. Put $d=d(G)$. We can choose elements $\sigma_{i} \in P(G)(1 \leqq i \leqq d)$ such that $\langle\varphi(P(G))\rangle_{k}=\underset{i=1}{\oplus} k \varphi\left(\sigma_{i}\right)$. Hence, for some $\delta \in G L(n, q)$, we have $\varphi\left(\delta^{\prime} \sigma_{i} \delta^{\prime-1}\right) \in k e_{i}(1 \leqq i \leqq d)$, where $\delta^{\prime}=\operatorname{diag}\left[1_{m}, \delta\right]$ and $\left\{e_{1}, \cdots, e_{n}\right\}$ is the standard basis of $k^{n}$. Since $G=\langle P(G)\rangle$ and $\langle\varphi(P(G))\rangle_{k}=\oplus_{i=1}^{d} k \varphi\left(\sigma_{i}\right)$, this lemma is obvious.

Proposition 3.3. Let $G$ be a subgroup of $A(m, n: q)$ of order $p^{d(G)}$ generated by pseudo-reflections. Then $S^{G}$ is a polynomial ring.

Proof. Put $d=d(G)$ and choose elements $\sigma_{i} \in P(G)(1 \leqq i \leqq d)$ such that $\langle\varphi(P(G))\rangle_{k}$ $=\stackrel{d}{\oplus} \underset{i=1}{ } k \varphi\left(\sigma_{i}\right)$. By (3.2) there exists $\Psi^{\prime}=\operatorname{diag}\left[1_{m}, \Psi\right] \in G L(m+n, q)$ such that $\varphi\left(\Psi^{\prime} \sigma_{i} \Psi^{\prime-1}\right) \epsilon$ $k e_{i}(1 \leqq i \leqq d)$ and $Z_{i} \in S^{G}(d<i \leqq n)$, where $\left\{e_{1}, \cdots, e_{n}\right\}$ is the standard basis of $k^{n}$ and ${ }^{t}\left[Z_{1}, \cdots, Z_{n}\right]=\Psi^{t}\left[Y_{1}, \cdots, Y_{n}\right]$. Set

$$
\Psi^{\prime} \sigma_{i} \Psi^{\prime-1}=\left[\begin{array}{cc}
E_{m} & 0 \\
\tilde{w}_{i 1} \cdots \tilde{w}_{i m} & E_{n}
\end{array}\right] \quad(1 \leqq i \leqq d) .
$$

Then we have $\tilde{w}_{i j}=w_{i j} e_{i}(1 \leqq i \leqq d ; 1 \leqq j \leqq m)$ for some $w_{i j} \in k$. Let

$$
W_{i}=Z_{i}^{p}-\left(\sum_{j=1}^{m} w_{i j} X_{j}\right)^{p-1} Z_{i} \quad(1 \leqq i \leqq d) .
$$

$S^{G}$ is integral over $k\left[X_{1}, \cdots, X_{m}, W_{1}, \cdots, W_{d}, Z_{d+1}, \cdots, Z_{n}\right]$. Since the rings have the
common quotient field, we obtain

$$
S^{G}=k\left[X_{1}, \cdots, X_{m}, W_{1}, \cdots, W_{d}, Z_{d+1}, \cdots, Z_{n}\right] .
$$

Proposition 3.4. Let $G$ be a subgroup of $A(1, n: q)$. Then $k\left[X, Y_{1}, \cdots, Y_{n}\right]^{a}$ is a polynomial ring and we can construct a system of fundamental invariants of $G$.

Proof. Assume that $|G|>p^{d(G)}$. Choose elements $\sigma_{1}^{(1)}, \cdots, \sigma_{d(G)}^{(1)} \in G$ such that $\langle\varphi(P(G))\rangle_{k}=\stackrel{d(G)}{\bigoplus_{i=1}} k \varphi\left(\sigma_{i}^{(1)}\right)$. Put $G_{1}=\left\langle\sigma_{1}^{(1)}, \cdots, \sigma_{d(G)}^{(1)}\right\rangle$, and take a suitable element $\Psi^{\prime}=$ $\operatorname{diag}[1, \Psi] \in G L(n+1, q)$ as we did in the proof of (3.3). Let ${ }^{t}\left[Z_{1}, \cdots, Z_{n}\right]=\Psi^{t}\left[Y_{1}, \cdots, Y_{n}\right]$ and let $W_{i}=Z_{i}{ }^{p}-\left(w_{i} X\right)^{p-1} Z_{i}(1 \leqq i \leqq d(G))$, where the elements $w_{i} \in k(1 \leqq i \leqq d(G))$ are determined by $\Psi^{\prime}$. Then we have $k\left[X, Y_{1}, \cdots, Y_{n}\right]^{G_{1}}=k\left[X, W_{1}, \cdots, W_{d(G)}, Z_{d(G)+1}, \cdots, Z_{n}\right]$ and $Z_{i} \in k\left[X, Y_{1}, \cdots, Y_{n}\right]^{G}(d(G)<i \leqq n)$. For $\sigma \in G^{(1)}=G / G_{1}$, there exist elements $a_{o}^{(i)} \in k$ $(1 \leqq i \leqq d(G))$ which satisfy $W_{i}{ }^{\sigma}=W_{i}+a_{\sigma}^{(i)} X^{p}$. Let $\tilde{X}=X^{p}$ and set

$$
\tilde{V}=k \tilde{X} \oplus k W_{1} \oplus \cdots \oplus k W_{d(G)} \oplus k Z_{d(G)+1} \oplus \cdots \oplus k Z_{n} .
$$

Then $G^{(1)}$ acts linearly and faithfully on the $k$-space $\tilde{V}$ and we can identify the group $G^{(1)}$ with the image of the canonical homomorphism from $G^{(1)}$ to the group $A(1, d(G): q)$ which is defined on the basis $\left\{\tilde{X}, W_{1}, \cdots, W_{d(G)}\right\}$. If $d\left(G^{(1)}\right) \neq 0$, then we can construct a subgroup $G_{2}$ of $G^{(1)}$ such that $\left|G_{2}\right|=p^{d\left(G^{(1))}\right.}=p^{d\left(G_{2}\right)}$. By (3.3), $k\left[X, W_{1}, \cdots, W_{d(G)}\right]^{G_{2}}$ is a polynomial ring. Hence $\left(k\left[X, Y_{1}, \cdots, Y_{n}\right]^{G_{1}}\right)^{G_{2}}$ is a polynomial ring. Put $G^{(2)}=G^{(1)} / G_{2}$. If $d\left(G^{(2)}\right) \neq 0$, then we continue this procedure. Since $G$ is finite, there is an integer $j>0$ such that $d\left(G^{(j)}\right)=0 . \quad d\left(G^{(j)}\right)=0$ implies $G^{(j)}=\{1\}$, and so this proposition is proved.

Proposition 3.5. Let $G$ be a subgroup of $\Lambda(m, 1: q)$. Then $k\left[X_{1}, \cdots, X_{m}, Y\right]^{a}$ is a polynomial ring.
 this case we may assume that $Y^{\tau_{i}}=Y+a_{i} X_{i}(1 \leqq i \leqq t)$ for some elements $a_{i} \in k$. Put $V_{1}(T)=T^{p}-\left(a_{1} X_{1}\right)^{p-1} T$ and define $V_{i+1}(T)=V_{i}(T)^{p}-V_{i}\left(a_{i} X_{i}\right)^{p-1} V_{i}(T)(1 \leqq i<t)$ inductively. Then we must have $k\left[X_{1}, \cdots, X_{m}, Y\right]^{a}=k\left[X_{1}, \cdots, X_{m}, V_{t}(Y)\right]$. Using this result we can prove the general case. The canonical isomorphism $k=\boldsymbol{F}_{p} 1 \oplus \boldsymbol{F}_{p} w_{2} \oplus$ $\cdots \oplus \boldsymbol{F}_{p} w_{f} \ni \sigma \longmapsto\left(\sigma^{(1)}, \cdots, \sigma^{(f)}\right) \in \boldsymbol{F}_{p}^{f}$ as $\boldsymbol{F}_{p}$-spaces induces a group homomorphism $\eta$ : $A(m, 1: q) \rightarrow A(m f, 1: p)$ defined by

$$
\left[\begin{array}{cc}
E_{m} & 0 \\
b_{1}, \cdots, b_{m} & 1
\end{array}\right] \longmapsto\left[\begin{array}{cc}
E_{m f} & 0 \\
b_{1}^{(1)}, \cdots, b_{1}^{(f)}, \cdots, b_{m}^{(1)}, \cdots, b_{m}^{(f)} & 1
\end{array}\right] .
$$

Let $R=k\left[X_{1}^{(1)}, \cdots, X_{1}^{(f)}, \cdots, X_{m}^{(1)}, \cdots, X_{m}^{(f)}, Y\right]$ be a polynomial ring of $m f+1$ variables with the canonical action of $\eta(G)$. Define a ring homomorphism $\rho$ from $R$ to $S=$
$k\left[X_{1}, \cdots, X_{m}, Y\right]$ by $\rho(Y)=Y, \rho\left(X_{1}^{(1)}\right)=X_{1}, \rho\left(X_{1}^{(2)}\right)=w_{2} X_{1}, \cdots, \rho\left(X_{1}^{(f)}\right)=w_{f} X_{1}, \cdots, \rho\left(X_{m}^{(1)}\right)$ $=X_{m}, \cdots, \rho\left(X_{m}^{(f)}\right)=w_{f} X_{m}$. There exists a polynomial $V(Y) \in R$ such that

$$
R^{\eta(G)}=k\left[X_{1}^{(1)}, \cdots, X_{1}^{(f)}, \cdots, X_{m}^{(1)}, \cdots, X_{m}^{(f)}, V(Y)\right] .
$$

Then we obtain $S^{G}=k\left[X_{1}, \cdots, X_{m}, \rho(V(Y))\right]$.

Theorem 3.6. Let $G$ be a subgroup of $G L_{n}(k)$ and let $R=k\left[T_{1}, \cdots, T_{n}\right]$. Then for any minimal prime ideal $p$ of $R, R^{I} G^{(p)}$ is a polynomial ring and can be determined effectively.

Proof. We may assume that $|N| \equiv 0 \bmod p$ where $N=I_{G}(p)$. There exists a normal $p$-subgroup $H$ of $N$ such that $([N: H], p)=1$. Since the action of $H$ on $R$ preserves the natural graduation of $R, \mathfrak{p}$ is generated by a homogeneous polynomial of degree 1. Exchanging the basis of $\oplus_{i=1}^{n} k T_{i}$, we can regard $H$ as a subgroup of $A(1, n-1: q)$. By (3.4), $R^{H}$ is a polynomial ring. $N / H$ is generated by generalized reflections in $R^{H}$, therefore $R^{v}=\left(R^{H}\right)^{N^{\prime} H}$ is a polynomial ring.

Theorem 3.7. Preserve the notation of (3.6) and let $I_{G}^{*}(\mathfrak{p})=\left\{t\left[\sigma_{i j}\right]: \sigma=\left[\sigma_{i j}\right] \in I_{G}(\mathfrak{p})\right\}$ for any minimal prime ideal $p$ of $R$. Then $R^{I_{G}^{*}(p)}$ is a polynomial ring.

Proof. This theorem is reduced to (3.5).
Remark 3.8. Let $V$ be an $n$-dimensional $k$-space and let $G$ be an abelian subgroup of $G L(V)$ generated by pseudo-reflections. If $n \leqq 3$, then $k[V]^{c}$ is a polynomial ring. Suppose that $n=4$ and that $G=S p(4, p) \cap A(2,2: p)$. Then $G$ is an abelian group generated by transvections, but $k[V]^{a}$ is not a polynomial ring.

## §4. Symmetric groups

First we will give a remark.
Proposition 4.1. Let $k$ be a field and let $G$ be a finite group. Let $V$ and $W$ be finite dimensional G-faithful kG-modules. Suppose that there exists a $k G$ epimorphism $\varphi: V \rightarrow W$. If $k[V]^{G}$ is a polynomial ring, then $k[W]^{a}$ is a polynomial ring.

Proof. Put $g=|G|$. Then $k[V]=\sum_{i=1}^{g} k[V]^{a} f_{i}$ for some $f_{i} \in k[V](1 \leqq i \leqq g)$. It follows that $k[W]=\sum_{i=1}^{g} k[W]^{a} \tilde{\varphi}\left(f_{i}\right)$, where the homomorphism $\tilde{\varphi}: k[V] \rightarrow k[W]$ is the epimorphism induced by $\varphi$. Since $G$ acts faithfully on $W, k[W]$ is a free $k[W]^{a_{-}}$ module. Hence $k[W]^{G}$ is a polynomial ring.

We preserve the following notation from here to (4.4).
Notation 4.2. Suppose that $k$ is a finite field of characteristic $p \neq 2$ and that $n$ is an integer with $n+2 \equiv 0 \bmod p, n \geqq 3$. Let $\tilde{V}=\underset{i=0}{\oplus+1} k e_{i}, V^{\prime}=\stackrel{n+1}{\oplus} \underset{i=1}{\oplus} k\left(e_{i}-e_{0}\right)$ and $V=$ $V^{\prime} \mid k \sum_{i=0}^{n+1} e_{i}$ be vector spaces with natural $k S_{n+2}$-module structure, where $S_{n+2}$ is the symmetric group of degree $n+2$. Let $\tilde{F}: S_{n+2} \rightarrow G L_{n+2}(k)\left(\right.$ resp. $\left.F^{\prime}: S_{n+2} \rightarrow G L_{n+1}(k)\right)$ be the matrix representation of $S_{n+2}$ on the basis $\left\{e_{0}, e_{1}, \cdots, e_{n+1}\right\}\left(\right.$ resp. $\left\{e_{1}-e_{0}, \cdots, e_{n+1}-\right.$ $\left.\left.e_{0}\right\}\right)$ and put $\tilde{G}=\operatorname{Im}(\tilde{F})\left(\right.$ resp. $\left.G^{\prime}=\operatorname{Im}\left(F^{\prime}\right)\right)$. Let

$$
\begin{aligned}
& \widetilde{\widetilde{G}}=w \tilde{G} w^{-1}, \quad G^{\prime \prime}=z G^{\prime} z^{-1} .
\end{aligned}
$$

We denote by $G$ the subgroup of $G L_{n}(k)$

$$
\left\{g \in G L_{n}(k):\left[\begin{array}{ll}
1 & 0 \\
b_{g} & g
\end{array}\right] \in G^{\prime \prime}\right\}
$$

Let $\Phi: \tilde{G} \rightarrow G^{\prime}\left(\right.$ resp. $\left.\Psi: G^{\prime} \rightarrow G\right)$ be the canonical isomorphism $\tilde{G} \rightarrow \widetilde{\widetilde{G}} \rightarrow G^{\prime}$ (resp. $G^{\prime} \rightarrow$ $\left.G^{\prime \prime} \rightarrow G\right)$. Then the two maps $P(\tilde{G}) \ni \sigma \longmapsto \Phi(\sigma) \in P\left(G^{\prime}\right), \quad P\left(G^{\prime}\right) \ni \sigma \longmapsto \Psi(\sigma) \in P(G)$ are bijective.

Lemma 4.3. $k\left[V^{\prime}\right]^{S_{n+2}}$ and $k[V]^{S_{n+2}}$ are not polynomial rings.
Proof. $G^{\prime}$ (resp. $G$ ) acts naturally on the column vector space $k^{n+1}$ (resp. $k^{n}$ ).
(A) Let $G^{\prime}\left(a^{\prime}\right)$ be the stabilizer of $G^{\prime}$ at $a^{\prime}$, where $a^{\prime}=t[1,2, \cdots, p-1,0,1, \cdots, p-$ $1, \cdots, 0,1, \cdots, p-1] \in k^{n+1}$. We identify $S_{n+2}$ with the group of permutation matrices in $G L_{n+2}(k)$. For $\delta \in G^{\prime}\left(a^{\prime}\right)$, there is an element $d$ of $\boldsymbol{F}_{p}$ such that

$$
\Phi^{-1}(\delta)\left[\begin{array}{c}
0 \\
a^{\prime}
\end{array}\right]=\left[\begin{array}{c}
0 \\
a^{\prime}
\end{array}\right]+\left[\begin{array}{c}
d \\
\vdots \\
d
\end{array}\right] .
$$

Since $\Phi^{-1}(\delta) \in P(\tilde{G})$ for $\delta \in P\left(G^{\prime}\left(a^{\prime}\right)\right)$, we have $d=0$. Therefore $\Phi^{-1}\left(P\left(G^{\prime}\left(a^{\prime}\right)\right)\right)=\left\{\left(i_{0}, j_{0}\right)\right.$ : $\left.i_{0} \equiv j_{0} \bmod p, i_{0} \neq j_{0}\right\} \cup\left\{E_{n+2}\right\}$. On the other hand

$$
\sigma^{\prime}=\left[\begin{array}{ccccc}
-1 & 1 & & & \\
-1 & & 1 & & \\
\vdots & & \ddots & \\
\vdots & 0 & & \\
-1 & & & & 1
\end{array}\right] \epsilon G^{\prime}\left(a^{\prime}\right)
$$

but $\sigma^{\prime}$ is not contained in $\left\langle P\left(G^{\prime}\left(a^{\prime}\right)\right)\right\rangle$. Since $G^{\prime}\left(a^{\prime}\right)$ is the decomposition group of $G^{\prime}$ at some maximal ideal of $\bar{k}\left[V^{\prime}\right]$, we have shown that $k\left[V^{\prime}\right]^{s_{n+2}}$ is not a polynomial ring by (1.4).
(B) For some $a \in k^{n}, z a^{\prime}=\left[\begin{array}{l}0 \\ a\end{array}\right]$. Let $G(a)$ be the stabilizer of $G$ at $a$. Then $\Psi\left(G^{\prime}\left(a^{\prime}\right)\right)=G(a)$. Since $\left\langle P\left(G^{\prime}\left(a^{\prime}\right)\right)\right\rangle \neq G^{\prime}\left(a^{\prime}\right)$ and $P\left(G^{\prime}\right) \ni \tau \longmapsto \Psi(\tau) \in P(G)$ is bijective, we obtain $\langle P(G(a))\rangle \neq G(a)$. Hence $k[V]^{S_{n+2}}$ is not a polynomial ring by (1.4).

Remark 4.4. Suppose that $V^{\prime *}$ is the dual space of $V^{\prime}$. Then $k\left[V^{\prime *}\right]^{s_{n+2}}$ is a polynomial ring over $k$ by (4.1).

Theorem 4.5. Let $k$ be a finite field of characteristic $p \neq 2$ and let $V$ be a faithful linear representation of least degree of $S_{n}$ with $n \geqq 7$. Then the following conditions are equivalent:
(1) $k[V]^{s_{n}}$ is a polynomial ring.
(2) $(n, p)=1$ and all transpositions of $S_{n}$ are represented by reflections in $G L(V)$.
And if $V$ satisfies these conditions, then we have $\operatorname{dim}(V)=n-1$.
Proof. According to [10] and (4.3), it is sufficient to show that (2) implies (1). We can obtain the $k S_{n}$-module $V$ as in (2) as follows. Let $\tilde{V}$ be a canonical representation of $S_{n}$ of degree $n$. Since $(n, p)=1$, the sequence $0 \rightarrow \tilde{V} s_{n \rightarrow i} \tilde{V} \rightarrow \operatorname{Coker}(i) \rightarrow 0$ is a split exact sequence of $k S_{n}$-modules and $\operatorname{Coker}(i)$ is $k S_{n}$-isomorphic to $V$. Therefore, by (4.1), $k[V]^{S_{n}}$ is a polynomial ring over $k$.

## § 5. Classical groups

In this section $k$ is a finite field of characteristic $p \neq 2$.
Theorem 5.1. Let $G$ be a subgroup of $G L_{2}(k)$. Suppose that $T(G)=\phi$ in the case of $p=3$. Then $k\left[T_{1}, T_{2}\right]^{a}$ is a polynomial ring if and only if $G$ is generated by pseudo-reflections.

Proof. We have only to show the if part. Assume that $G$ is generated by pseudo-reflections. Since $T(G)=\phi$ implies $(|G|, p)=1, k\left[T_{1}, T_{2}\right]^{G}$ is a polynomial ring in the case of $T(G)=\phi$. Suppose that $T(G) \neq \phi$ and let $H=\langle T(G)\rangle$. Then we have $(|G / H|, p)=1$. If $G$ is reducible, we may assume that $H$ is contained in $A(1,1: q)$. Since $k\left[T_{1}, T_{2}\right]^{H}$ is a polynominal ring, $k\left[T_{1}, T_{2}\right]^{G}=\left(k\left[T_{1}, T_{2}\right]^{H}\right)^{G^{/ H}}$ is regular by (1.3). Hence, by (2.4), we can suppose that $G$ is irreducible primitive. By Clifford's theorem [12], $\S 49), H$ is irreducible and $H$ is conjugate in $G L_{2}(k)$ to $S L(2, q)$. It is known
that $k\left[T_{1}, T_{2}\right]^{H}$ is a polynomial ring. By (1.3), $k\left[T_{1}, T_{2}\right]^{G}$ is regular. Thus the proof is completed.

Theorem 5.2. For a transvection group $G \subseteq G L_{n}(k)(n \geqq 3)$, the following conditions are equivalent:
(1) $k\left[T_{1}, \cdots, T_{n}\right]^{a}$ is a polynomial ring over $k$.
(2) $G$ is conjugate in $G L_{n}(k)$ to $S L(n, q)$.

Proof. According to (1.6), it suffices to prove that $k\left[T_{1}, \cdots, T_{n}\right]^{a}$ is not a polynomial ring for $G=S p(n, q)$ or $S U\left(n, q^{2}\right)$. Put $S=k\left[T_{1}, \cdots, T_{n}\right]$.
(A) First we suppose that $n=4$ and $G=S p(4, q)$. Let $\left\{T_{1}, T_{2}, T_{3}, T_{4}\right\}$ be the canonical basis on which $G$ can be expressed in the form $\left\{\sigma \in S L(4, q):{ }^{\iota} \sigma \Phi_{\sigma}=\Phi\right\}$ where

$$
\Phi=\left[\begin{array}{cc}
0 & E_{2} \\
-E_{2} & 0
\end{array}\right] .
$$

Take maximal ideals $\mathfrak{m}_{1}=\left(T_{1}-1, T_{2}, T_{3}, T_{4}\right), \mathfrak{m}_{2}=\left(T_{1}, T_{2}-1, T_{3}, T_{4}\right), \mathfrak{m}_{3}=\left(T_{1}, T_{2}, T_{3}-\right.$ $\left.1, T_{4}\right), \mathfrak{m}_{4}=\left(T_{1}, T_{2}, T_{3}, T_{4}-1\right)$ of $S$ and put $H=\bigcap_{i=1}^{2} D_{G}\left(\mathfrak{m}_{i}\right), N=\left\langle D_{H}\left(\mathfrak{m}_{3}\right), D_{H I}\left(\mathfrak{m}_{4}\right)\right\rangle$. Then there exist homogeneous polynomials $X_{1}, X_{2}$ of degree $q$ such that $S^{N}=k\left[T_{1}, T_{2}, X_{1}, X_{2}\right]$. We regard $S^{N}=\bigoplus_{i=0}^{\infty}\left(S^{N}\right)_{i}$ and $S^{H}=\bigoplus_{i=0}^{\infty}\left(S^{H}\right)_{i}$ as graded subalgebras of $S$. Assume that $S^{H}$ is a polynomial ring. Since $\operatorname{dim}_{k}\left(S^{H}\right)_{1}=2$, there are homogeneous polynomials $f_{1}, f_{2}$, which satisfy $S^{H}=k\left[T_{1}, T_{2}, f_{1}, f_{2}\right] . \quad S^{N}$ is integral over $S^{H}$ and so the set $\left\{T_{1}, T_{2}, f_{1}, f_{2}\right\}$ is a system of parameters of $S^{N}$ at origin. Let $\varphi: S^{N} \rightarrow k\left[X_{1}, X_{2}\right] \subseteq S$ be a ring homomorphism defined by $\varphi\left(T_{1}\right)=\varphi\left(T_{2}\right)=0$ and $\varphi\left(X_{i}\right)=X_{i}(i=1,2)$. From $\varphi\left(f_{i}\right) \neq 0$, we obtain $\operatorname{deg}\left(f_{i}\right)=\operatorname{deg}\left(\varphi\left(f_{i}\right)\right)$ in $S(i=1,2)$. Hence $\operatorname{deg}\left(f_{i}\right)$ is a power of q. But $|H|=q^{3}=\prod_{i=1}^{2} \operatorname{deg}\left(f_{i}\right)$ and $\left.\varphi\left(\left(S^{H}\right)_{q}\right)=\varphi\left(\left(\mathrm{S}^{N}\right)_{q}\right)^{H^{\prime N}}\right)=0$, which is a contradiction. Therefore $S^{G}$ is not a polynomial ring by (1.4). The general case is reduced to the case of $S p(4, q)$ with aids of (1.2) and (1.4).
(B) We consider the case of $G=S U\left(n, q^{2}\right)$. It is sufficient to prove the assertion for $n=3$. Let $\lambda \longmapsto \bar{\lambda}$ be an involutory automorphism of the field $\boldsymbol{F}_{q^{2}}$, and let $\varepsilon \in$ $\boldsymbol{F}_{q^{2}}^{*}$ be an element such that $\operatorname{Tr}(\varepsilon)=0$. We denote

$$
\left.\Gamma\left(q^{2}\right)=\left\{\sigma \in S L\left(3, q^{2}\right): \overline{{ }_{\tau}^{\sigma}}\right) ~ \Psi \sigma ~=\Psi\right\}
$$

where

$$
\Psi=\left[\begin{array}{rrr}
0 & \varepsilon & 0 \\
-\varepsilon & 0 & 0 \\
0 & 0 & 1
\end{array}\right]
$$

Suppose that $H$ is the stabilizer of $\Gamma\left(q^{2}\right)$ at ${ }^{t}[1,0,0]$ under the natural action of $\Gamma\left(q^{2}\right)$
on the column vector space $\boldsymbol{F}_{q^{2}}^{3}$ over $\boldsymbol{F}_{q^{2}}$. It is easy to show that $H$ is not generated by pseudo-reflections in $G L\left(3, q^{2}\right)$. Since $G$ is conjugate to $\Gamma\left(q^{2}\right), S^{G}$ is not a polynomial ring by (1.4).

We give the following remark which is a generalization of the preceding result without its proof.

Remark 5.3. Let $G$ be an irreducible subgroup of $G L_{n}(k)$ which contains a transvection and suppose $n \geqq 4$. Then $k\left[T_{1}, \cdots, T_{n}\right]^{\sigma}$ is a polynomial ring if and only if $G$ is generated by pseudo-reflections and the normal subgroup $\langle T(G)\rangle$ is conjugate to $S L(n, q)$ in $G L_{n}(k)$.

Theorem 5.4. Let $F$ be a subfield of $k$ and let $\mathcal{O}$ be the orthogonal group of a non-singular quadratic form $Q$ of dimension $n$ over $F$. Suppose that $G$ is a subgroup of $\mathcal{O}$ which contains the commutator subgroup $\Omega$ of $\mathcal{O}$. If $n \geqq 4$, then $k\left[T_{1}, \cdots, T_{n}\right]^{d}$ is not a polynomial ring over $k$.

Proof. Let $\nu$ be the index of $Q$ and let $V$ be the $n$-dimensional $F$-space with the quadratic form $Q$. For a subgroup $N$ of $\mathcal{O}$, we denote by $N(x)$ the stabilizer of $N$ at $x \in V$ under the natural action of $N$ on $V$. Let $W$ be a suitable maximal totally isotropic subspace of $V$. If $n=2 \nu$, then we have $H=\bigcap_{x \in W} \mathcal{O}(x) \cong F^{\nu(\nu-1) / 2}$. In general $V$ can be expressed as an orthogonal direct sum of hyperbolic planes $M_{i}$ ( $1 \leqq i \leqq \nu$ ) and a quadratic space $L$ of index 0 . Hence, if $\nu \geqq 2$, we obtain $H^{\prime}=\bigcap_{x \in W} \mathcal{O}^{\prime}(x)$ $\cong F^{\nu(\nu-1) / 2}$ where $\mathcal{O}^{\prime}=\bigcap_{x \in L} \mathcal{O}(x)$. Suppose that $\nu \geqq 2$. Consequently we can take maximal ideals $\mathfrak{m}_{i}(1 \leqq i \leqq \nu+2)$ of $\bar{k}\left[T_{1}, \cdots, T_{n}\right]$ such that

$$
F^{\nu(\nu-1) 2 /} \cong \bigcap_{i=1}^{\nu+2} D_{\mathcal{O}}\left(\mathfrak{n}_{i}\right)=\bigcap_{i=1}^{\nu+2} D_{S O}\left(\mathfrak{n t}_{i}\right)
$$

where

$$
S \mathcal{O}=S L_{n}(k) \cap \mathcal{O} .
$$

Since $S \mathcal{O} / \Omega \cong F^{*} / F^{* 2} \cong \boldsymbol{Z} / 2 \boldsymbol{Z}, \bigcap_{i=1}^{\nu+2} D_{\Omega}\left(\mathfrak{n}_{i}\right) \neq\{1\}$ follows. On the other hand we have $P\left(\bigcap_{i=1}^{\nu+2} D_{O}\left(\mathfrak{m}_{i}\right)\right)=\{1\}$. Hence $\bigcap_{i=1}^{\nu+2} D_{G}\left(\mathfrak{n}_{i}\right)$ is not generated by pseudo-reflections. Next we assume that $\nu=1$. Then it follows that $n=4$ and $\mathcal{O}=O_{4}^{-}(F)$. Take an isotropic point and a non-isotropic point of $V$ appropriately. Then we can choose maximal ideals $n_{1}, n_{2}$ of $\bar{k}\left[T_{1}, T_{2}, T_{3}, T_{4}\right]$ such that $\left|\left\langle P\left(\bigcap_{i=1}^{2} D_{O_{4}^{-}(F)}\left(\mathfrak{n}_{i}\right)\right)\right\rangle\right|=2$ and $\bigcap_{i=1}^{2} D_{S O_{4}^{-}(F)}\left(\mathfrak{n}_{i}\right)$ $\cong F$ where $S O_{4}^{-}(F)=S L_{4}(k) \cap O_{4}^{-}(F)$. Since $\left|S O_{4}^{-}(F) / \Omega\right|=2, \bigcap_{i=1}^{2} D_{G}\left(\mathfrak{n}_{i}\right)$ is not generated by pseudo-reflections. In both cases $k\left[T_{1}, \cdots, T_{n}\right]^{a}$ is not a polynomial ring by (1.4).

Remark 5.5. Let $G \subseteq G L_{n}(k)$ be a reflection group and let $n>3, p>7$. Then
$k\left[T_{1}, \cdots, T_{n}\right]^{G}$ is a polynomial ring over $k$ if and only if $G$ is conjugate in $G L_{n}(k)$ to one of the groups in the following list:
(i) The symmetric group $S_{n+1}$ where $n+1 \neq 0 \bmod p$.
(ii) The groups in part (3) of (1.7).

This follows from (1.3), (1.7), (4.3), (4.4) and (5.4).
