# Stably extendible vector bundles over the quaternionic projective spaces 

Mitsunori Imaoka and Kouji Kuwana<br>(Received July 10, 1998)<br>(Revised August 6, 1998)<br>Dedicated to Professor Fuichi Uchida on his 60th birthday

#### Abstract

We show that, if a quaternionic $k$-dimensional vector bundle $\gamma$ over the quaternionic projective space $H P^{n}$ is stably extendible and its non-zero top Pontrjagin class is not zero $\bmod 2$, then $\gamma$ is stably equivalent to the Whitney sum of $k$ quaternionic line bundles provided $k \leq n$.

## 1. Introduction and results

Let $F$ denote the field of the complex numbers $\mathbf{C}$, that of the real numbers $\mathbf{R}$ or the skew field of the quaternionic numbers $\mathbf{H}$, and $F P^{n}$ the $n$-dimensional $F$-projective space. Two $F$-vector bundles $V$ and $W$ over a finite complex $B$ are said to be stably equivalent if the Whitney sums $V \oplus I_{a}$ and $W \oplus I_{b}$ for some trivial $F$-vector bundles $I_{a}$ and $I_{b}$ are isomorphic as $F$-vector bundles.

The purpose of this paper is to study Schwarzenberger's property for vector bundles over the quaternionic projective space $H P^{n}$. Schwarzenberger ([Sc], [Hi]) has shown the fact that a $k$-dimensional $F$-vector bundle $V$ over $F P^{n}$ for $F=\mathbf{R}$ or $\mathbf{C}$ is stably equivalent to a Whitney sum of $k F$-line bundles if $V$ is extendible, that is, if $V$ is the restriction of a $F$-vector bundle over $F P^{m}$ for any $m \geq n$. For the $\mathbf{C}$-vector bundles over $C P^{n}$, proofs have been given by $[\mathrm{Re}]$ and $[\mathrm{AM}]$. As for the $\mathbf{R}$-vector bundles over $R P^{n}$, the stable splitting is also true under the assumption that $V$ is the restriction of a vector bundle over $R P^{m}$ for sufficiently large $m$ ([Sc]). Some related results concerning vector bundles over the lens spaces are found in [KMY], [KM]. Our results mean that some additional conditions seem necessary for the quaternionic vector bundles over $H P^{n}$.

We remark that the extendible condition can be slightly weakened. A $k$-dimensional $F$-vector bundle $\gamma$ over $F P^{n}$ is called stably extendible if for

[^0]each $m \geq n$ there exists a $k$-dimensional $F$-vector bundle $\tilde{\gamma}_{m}$ over $F P^{m}$ whose restriction to $F P^{n}$ is stably equivalent to $\gamma$ as $F$-vector bundles. Then, the original result due to Schwarzenberger is also valid if we only assume that the vector bundle is stably extendible instead of extendible.

Let $\xi$ be the canonical quaternionic line bundle over $H P^{n}$, and $X=P_{1}(\xi)$ the first symplectic Pontrjagin class of $\xi$. Here, the symplectic Pontrjagin class $P_{i}(\zeta) \in H^{4 i}(B ; \mathbf{Z})$ for a quaternionic $k$-dimensional vector bundle $\zeta$ over a space $B$ is given by $P_{i}(\zeta)=(-1)^{i} C_{2 i}\left(c^{\prime}(\zeta)\right)$, the Chern class of the underlying complex vector bundle $c^{\prime}(\zeta)$ of $\zeta$ up to sign. Also we denote the total symplectic Pontrjagin class of $\zeta$ by $P(\zeta)=1+P_{1}(\zeta)+\cdots+P_{k}(\zeta)$. Then, the cohomology ring $H^{*}\left(H P^{n} ; \mathbf{Z}\right)$ is isomorphic to a truncated polynomial ring $\mathbf{Z}[X] /\left(X^{n+1}\right)$. Our results are stated as follows:

Theorem A. Let $k \leq n$. If a quaternionic $k$-dimensional vector bundle $\gamma$ over $H P^{n}$ is stably extendible, then $P(\gamma)=\prod_{i=1}^{k}\left(1+m_{i}^{2} X\right)$ for some $m_{i} \in \mathbf{Z}$.

Theorem B. Let $\gamma$ be a stably extendible quaternionic $k$-dimensional vector bundle over $H P^{n}$ for $k \leq n$. If $P_{m}(\gamma) \equiv X^{m}(\bmod 2)$ for some $0 \leq m \leq k$ and $P_{i}(\gamma)=0$ for any $i>m$, then $\gamma$ is stably equivalent to a Whitney sum $\gamma(1) \oplus \cdots$ $\oplus \gamma(m)$ of some quaternionic line bundles $\gamma(1), \ldots, \gamma(m)$ over $H P^{n}$.

We remark that some counter example arises if the condition $P_{m}(\gamma) \equiv$ $X^{m}(\bmod 2)$ is removed in Theorem B, as follows:

Proposition C. Let $\gamma$ be a quaternionic vector bundle stably equivalent to $\left(\xi \otimes_{\mathbf{H}} \xi^{*}\right) \otimes_{\mathbf{R}} \mathbf{H}$, the quaternification of $\xi \otimes_{\mathbf{H}} \xi^{*}$, over HP for $n \geq 2$, where $\xi^{*}$ is the quaternionic conjugate bundle of $\xi$. Then, $\gamma$ is stably extendible and its total Pontrjagin class is $P(\gamma)=(1+4 X)^{2}$, but $\gamma$ is not stably equivalent to any Whitney sum of less than or equal to $n$ numbers of quaternionic line bundles.

As for a stably extendible complex vector bundle $\rho$ over $H P^{n}$, similar results with Theorems A and B hold if the Pontrjagin classes are replaced by the Chern classes $C_{i}(\rho)$ and quaternionic line bundles $\gamma(i)$ by some complex 2-dimensional vector bundles.

The authors would like to thank Prof. Matumoto for his valuable comments on the first version of their manuscript.

## 2. Proofs

Let $F(t)=t^{r}-m_{1} t^{r-1}+\cdots+(-1)^{r-1} m_{r-1} t+(-1)^{r} m_{r} \in \mathbf{Z}[t]$ be a polynomial, and $F(t)=\prod_{i=1}^{r}\left(t-z_{i}\right)$ its factorization by complex numbers $z_{i} \in \mathbf{C}$. We set $s_{j}(F)=\sum_{i=1}^{r} z_{i}^{j}$ for $j \geq 1$. Then, $\left\{s_{j}(F)\right\}$ satisfies Newton's relations

$$
\begin{equation*}
\sum_{i=0}^{j-1}(-1)^{i} m_{i} s_{j-i}(F)=(-1)^{j+1} j m_{j} \tag{2.1}
\end{equation*}
$$

for any $j \geq 1$, where $m_{0}=1$ and $m_{i}=0$ if $i>r$. Thus, all $s_{j}(F)$ are integers. Concerning the linear factorization of a polynomial, Feit-Rees has shown the following fact.

Theorem 1 [FR]. If $s_{j}(F) \equiv s_{j+p-1}(F)(\bmod p)$ for $1 \leq j \leq r$ and for all but a finite number of primes $p$, then $F(t)$ is a product of linear factors in $\mathbf{Z}[t]$, that is, $z_{i} \in \mathbf{Z}$ for $1 \leq i \leq r$.

Rees [Re] and Adams-Mahmud [AM] have shown that this property is effective to prove Schwarzenberger's property for complex vector bundles over $C P^{n}$. Their methods are also valid if the assumption of the extendibility is weakened to stably extendibility, and we have the following, where $x=C_{1}\left(\xi_{\mathbf{c}}\right)$ $\in H^{2}\left(C P^{n} ; \mathbf{Z}\right)$ is the first Chern class of the canonical complex line bundle $\xi_{\mathbf{C}}$ over $C P^{n}$ :

Proposition 2. Let $k \leq n$. Then, we have the following:
(1) If $\rho$ is a stably extendible complex $k$-dimensional vector bundle over $C P^{n}$, then the total Chern class $C(\rho)$ of $\rho$ factorizes as $C(\rho)=\prod_{i=1}^{k}\left(1+a_{i} x\right)$ for some integers $a_{i}$.
(2) If $\gamma$ is a stably extendible quaternionic $k$-dimensional vector bundle over $H P^{n}$, then the total symplectic Pontrjagin class $\boldsymbol{P}(\gamma)$ of $\gamma$ factorizes as $\boldsymbol{P}(\gamma)=$ $\prod_{i=1}^{k}\left(1+b_{i} X\right)$ for some integers $b_{i}$.

Proof. We shall prove (2) since the proof of (1) is similar and simpler. Thus, assume that $\gamma$ is a stably extendible quaternionic $k$-dimensional vector bundle over $H P^{n}$ for $k \leq n$. The $i$-th symplectic Pontrjagin class of $\gamma$ is denoted by $P_{i}(\gamma)=u_{i} X^{i}$ for some $u_{i} \in \mathbf{Z}$, where $u_{0}=1$ and $u_{i}=0$ for $i>k$. Then, for the polynomial $Q(t)=\sum_{i=0}^{k}(-1)^{i} u_{i} t^{k-i} \in \mathbf{Z}[t]$, we define integers $s_{j}$ as $s_{j}(Q)$ of (2.1) for $m_{i}=u_{i}$. That is, $s_{0}=1$ and $s_{j}$ for $j \geq 1$ is defined recursively by

$$
\begin{equation*}
\sum_{i=0}^{j-1}(-1)^{i} u_{i} s_{j-i}=(-1)^{j+1} j u_{j} . \tag{2.2}
\end{equation*}
$$

When we need to distinguish $\left\{s_{j}\right\}$ for different $\gamma$ 's, we denote $s_{j}$ by $s_{j}(\gamma)$.
Remark that the total Pontrjagin class $P(\gamma)$ is equal to $(-1)^{k} X^{k} Q(-1 / X)$. Hence, if $Q(t)$ is shown to be a product of linear factors in $\mathbf{Z}[t]$, then $P(\gamma)$ turns out to be a product of linear factors in $\mathbf{Z}[X]$ as required. Thus, by Theorem 1, it suffices to show that for all but a finite number of primes $p$ it holds

$$
\begin{equation*}
s_{j} \equiv s_{j+p-1}(\bmod p) \quad \text { for } 1 \leq j \leq k \tag{2.3}
\end{equation*}
$$

Let $p$ be any prime with $p>k(2 k-1)$, and $m$ an integer satisfying $m \geq$ $\max (k+p, n)$. By the assumption, there exists a quaternionic $k$-dimensional vector bundle $\gamma_{m}$ over $H P^{m}$ whose restriction to $H P^{n}$ is stably equivalent to $\gamma$. Let $f_{m}: H P^{m} \rightarrow B S p$ be the classifying map of the virtual bundle $\gamma_{m}-I_{k}$, and $i: H P^{n} \rightarrow H P^{m}$ the inclusion. Thus, $f=f_{m} i: H P^{n} \rightarrow B S p$ is the classifying map for $\gamma-I_{k}$. For the universal symplectic Pontrjagin classes $P_{i} \in$ $H^{4 i}(B S p ; \mathbf{Z})$, we define a class $\tilde{s}_{j} \in H^{4 j}(B S p ; \mathbf{Z})$ for $j \geq 1$ recursively as in (2.1) by the relations

$$
\begin{equation*}
\sum_{i=0}^{j-1}(-1)^{i} P_{i} \tilde{S}_{j-i}=(-1)^{j+1} j P_{j} \tag{2.4}
\end{equation*}
$$

Since $s_{j}\left(\gamma_{m}\right)=s_{j}(\gamma), f_{m}^{*}\left(\tilde{s}_{j}\right)=s_{j} X^{j}$ by (2.2) and (2.4).
By the naturality of the cohomology operation $\mathscr{P}^{2}: H^{*}(Y ; \mathbf{Z} / p) \rightarrow$ $H^{*+4(p-1)}(Y ; \mathbf{Z} / p)$, we have $\mathscr{P}^{2} f_{m}^{*}\left(\tilde{s}_{j}\right)=f_{m}^{*}\left(\mathscr{P}^{2} \tilde{s}_{j}\right)$. Moreover, for $1 \leq j \leq k$,

$$
\begin{aligned}
& \mathscr{P}^{2} f_{m}^{*}\left(\tilde{s}_{j}\right)=s_{j} \mathscr{P}^{2}\left(X^{j}\right)=\binom{2 j}{2} s_{j} X^{j+p-1} ; \\
& f_{m}^{*}\left(\mathscr{P}^{2} \tilde{s}_{j}\right)=f_{m}^{*}\left(\binom{2 j}{2} \tilde{s}_{j+p-1}\right)=\binom{2 j}{2} s_{j+p-1} X^{j+p-1} .
\end{aligned}
$$

Since $1 \leq\binom{ 2 j}{2}<p$ and $j+p-1 \leq m$ for $1 \leq j \leq k$ by the assumption, we obtain (2.3), which completes the proof.

Proof of Theorem A. Let $\gamma$ be a stably extendible quaternionic $k$ dimensional vector bundle over $H P^{n}$ for $k \leq n$. Then, by Proposition 2(2), we have $P(\gamma)=\prod_{i=1}^{k}\left(1+b_{i} X\right)$ for some $b_{i} \in \mathbf{Z}$. Thus, in order to complete the proof, it is sufficient to show that each integer $b_{i}$ is a square.

Let $q: C P^{2 n+1} \rightarrow H P^{n}$ be the canonical projection, and $c^{\prime}(\gamma)$ denote underlying complex vector bundle of $\gamma$, that is, the complexification of $\gamma$. Then, $q^{*} c^{\prime}(\gamma)$ is a stably extendible complex $2 k$-dimensional vector bundle over $C P^{2 n+1}$. Hence, by Proposition 2(1), the total Chern class of $q^{*} c^{\prime}(\gamma)$ is written as $C\left(q^{*} c^{\prime}(\gamma)\right)=\prod_{i=1}^{2 k}\left(1+a_{i} x\right)$ for some integers $a_{i}$. On the other hand, we have

$$
C\left(q^{*} c^{\prime}(\gamma)\right)=q^{*}\left(C\left(c^{\prime}(\gamma)\right)\right)=q^{*}\left(\prod_{i=1}^{k}\left(1-b_{i} X\right)\right)=\prod_{i=1}^{k}\left(1-b_{i} x^{2}\right)
$$

since $C_{2 j}\left(c^{\prime}(\gamma)\right)=(-1)^{j} P_{j}(\gamma), C_{2 j+1}\left(c^{\prime}(\gamma)\right)=0$ and $q^{*}(X)=x^{2}$ by definitions. Thus, comparing these two expressions of $C\left(q^{*} c^{\prime}(\gamma)\right)$, we conclude that $b_{i}=$ $m_{i}^{2}, 1 \leq i \leq k$, for some integers $m_{i}$.

In order to establish Theorem B, we need the following result.

Theorem 3 ([Su], [FG]). The degree of non-zero self map $f: H P^{\infty} \rightarrow$ $H P^{\infty}$ is an odd square, that is, $f^{*}(X)=(2 h+1)^{2} X$ for some integer $h$, and conversely, for any integer $h$, there exists a self map $f$ of $H P^{\infty}$ whose degree is $(2 h+1)^{2}$.

The symplectic Pontrjagin classes determine the stably equivalent classes of quaternionic vector bundles over $H P^{n}$ as follows:

Lemma 4. Quaternionic vector bundles $V$ and $W$ over $H P^{n}$ are stably equivalent as quaternionic vector bundles if and only if they have the same symplectic Pontrjagin classes $P(V)=P(W)$.

Proof. The only if part is clear by the stable property $P\left(V \oplus I_{a}\right)=P(V)$ of the symplectic Pontrjagin class. We assume that $P(V)=P(W)$ for quaternionic vector bundles $V, W$ over $H P^{n}$. Let $\widetilde{K S p}\left(H P^{n}\right)$ be the reduced symplectic $K$-group of $H P^{n}$, which is isomorphic to the based homotopy group $\left[H P^{n}, B S p\right]$. Then, by the definition of the symplectic $K$-group, it suffices to show that the virtual bundles $\alpha=V-\operatorname{dim} V$ and $\beta=W-\operatorname{dim} W$ represent the same class of $\widetilde{K S p}\left(H P^{n}\right)$. The Pontrjagin character ph: $\widetilde{K S p}\left(H P^{n}\right) \rightarrow$ $H^{*}\left(H P^{n} ; \boldsymbol{Q}\right)$ has the form of $p h(\alpha)=2 \sum_{k=1}^{n} \alpha^{*}\left(\tilde{s}_{k}\right) /(2 k)!$. Here, we regard $\alpha$ as an element of $\left[H P^{n}, B S p\right]$, and $\tilde{s}_{k} \in H^{4 k}(B S p ; \mathbf{Z})$ are the classes of (2.4). Since $\alpha^{*}\left(\tilde{s}_{k}\right)=s_{k}(V)$ is determined by $P(V)$, the equality $p h(\alpha)=p h(\beta)$ follows from the assumption that $P(V)=P(W)$.

By definition, the Pontrjagin character $p h$ is the composition of the complexification $c: \widetilde{K S p}\left(H P^{n}\right) \rightarrow \tilde{K}\left(H P^{n}\right)$ and the Chern character $c h: \tilde{K}\left(H P^{n}\right) \rightarrow H^{*}\left(H P^{n} ; \mathbf{Q}\right)$. The Chern character ch is injective since $H^{*}\left(H P^{n} ; \mathbf{Z}\right)$ has no torsion ([AH; 2.5 Corollary]). Also, the complexfication $c$ is injective as is well known. Hence $p h$ is injective, and thus $\alpha=\beta$, which completes the proof.

Remark 5. The above argument in the proof of Lemma 4 simply says that the map $g: \widetilde{K S p}\left(H P^{n}\right) \rightarrow \operatorname{Hom}\left(H_{*}\left(H P^{n} ; \mathbf{Z}\right), H_{*}(B S p ; \mathbf{Z})\right)$ defined by $g(\alpha)=\alpha_{*}$ is injective. In fact, $P(\alpha)=P(V)$ determines $\alpha$ as is shown, and $P_{j}(\alpha)=\left\langle P_{j}, \alpha_{*}\left(b_{j}\right)\right\rangle X^{j}$ is determined by $\alpha_{*}$, where $b_{i} \in H_{4 i}\left(H P^{n} ; \mathbf{Z}\right)$ is the dual homology class of $X^{i}$.

Proof of Theorem B. Let $\gamma$ be a stably extendible quaternionic $k$ dimensional vector bundle over $H P^{n}$ for $k \leq n$. By Theorem A we have $P(\gamma)$ $=\prod_{i=1}^{k}\left(1+m_{i}^{2} X\right)$ for some integers $m_{i}$. But, each $m_{i}$ must be either odd or zero by the assumption $P_{m}(\gamma) \equiv X^{m}(\bmod 2)$. By Theorem 3, there exists a quaternionic line bundle $\tilde{\gamma}(i)$ over $H P^{\infty}$ with $P(\tilde{\gamma}(i))=1+m_{i}^{2} X$ for each $1 \leq$ $i \leq k$. Let $\gamma(i)$ be the restriction of $\tilde{\gamma}(i)$ over $H P^{n}$. Then, we have $P(\gamma)=$ $P(\gamma(1) \oplus \cdots \oplus \gamma(k))$, and thus the required result by Lemma 4 .

Proof of Proposition C. Let $\gamma$ be stably equivalent to $\left(\xi \otimes_{\mathbf{H}} \xi^{*}\right) \otimes_{\mathbf{R}} \mathbf{H}$, the quaternionification of the bundle $\xi \otimes_{\mathbf{H}} \xi^{*}$, over $H P^{n}$ for $n \geq 2$. Clearly, $\gamma$ is stably extendible. The complexification $c^{\prime}(\gamma)$ of $\gamma$ is stably equivalent to $2 c\left(\xi \otimes_{\mathbf{H}} \xi^{*}\right) \cong 2 c^{\prime}(\xi) \otimes_{\mathbf{C}} c^{\prime}(\xi)$, where $c\left(\xi \otimes_{\mathbf{H}} \xi^{*}\right)$ denotes $\left(\xi \otimes_{\mathbf{H}} \xi^{*}\right) \otimes_{\mathbf{R}} \mathbf{C}$. Since the total Chern class $C\left(c^{\prime}(\xi) \otimes_{\mathbf{C}} c^{\prime}(\xi)\right)$ is equal to $1-4 X$, the total Pontrjagin class $P(\gamma)$ is equal to $(1+4 X)^{2}$.

Suppose that $\gamma$ is stably equivalent to $\bigoplus_{i=1}^{k} l_{i}$ for some quaternionic line bundles $l_{i}$ and some $k \leq n$. If $P\left(l_{i}\right)=1+t_{i} X$ for $1 \leq i \leq k$, where $t_{i} \in \mathbf{Z}$, then we have the equality $(1+4 X)^{2}=\prod_{i=1}^{k}\left(1+t_{i} X\right)$ in $H^{*}\left(H P^{n}\right)=\mathbf{Z}[X] /\left(X^{n+1}\right)$. Since $k \leq n$, we may assume that $t_{1}=t_{2}=4$ and $t_{i}=0$ for $i \geq 3$. Then, we have a classifying map $f: H P^{n} \rightarrow H P^{n}$ of $l_{1}$, and thus $f^{*}(X)=4 X$. However, by Feder-Gitler ([FG]), if $g^{*}(X)=\lambda X$ holds for some map $g: H P^{n} \rightarrow H P^{n}$ for $n \geq 2$, then the integer $\lambda$ satisfies $\lambda(\lambda-1) \equiv 0(\bmod 24)$. Hence, $\lambda \neq 4$, which contradicts the existence of $f$. Therefore, $\gamma$ cannot be stably decomposed into a sum of $k$ numbers of quaternionic line bundles for $k \leq n$, which completes the proof.

Remark 6. We defined a $k$-dimensional $F$-vector bundle $\gamma$ over $F P^{n}$ to be stably extendible if it extends stably to some $k$-dimensional $F$-vector bundle $\tilde{\gamma}_{m}$ over $F P^{m}$ for any $m \geq n$. The restriction of $\operatorname{dim}_{F} \tilde{\gamma}_{m}=k$ was needed in the proof of Theorem A. It is still open whether this restriction of dimension is actually necessary or not.

Remark 7. In Theorem B and Proposition C, we discuss when a quaternionic vector bundle over $H P^{n}$ is stably equivalent to the Whitney sum of less than or equal to $n$ numbers of quaternionic line bundles. It is still open how it becomes if we are allowed to take the Whitney sum of more than $n$ numbers of line bundles.
