# On a posteriori Error Estimation in the Numerical Solution of Systems of Ordinary Differential Equations 

Yuichi Hayashi<br>(Received September 19, 1978)

## 1. Introduction

Consider the boundary value problem

$$
\begin{align*}
& \frac{d x}{d t}=X(x, t), \quad a \leqq t \leqq b,  \tag{1.1}\\
& f[x]=0, \tag{1.2}
\end{align*}
$$

where $x$ and $X(x, t)$ are real $n$-vectors, $f$ is an operator from $D \subset C[J]$ into $R^{n}$ which is continuously Fréchet differentiable in $D$, and $C[J]$ is the space of $n$ vector functions continuous on $J=[a, b]$.

In our previous paper [2], replacing (1.1) with an equivalent system of integral equations, we obtained a posteriori error estimates of continuous approximate solutions of (1.1), (1.2). In those estimates the fundamental matrix of a linear homogeneous system of differential equations plays an important role and its inverse matrix is also required. In many practical applications, however, exact fundamental matrices and their exact inverses are not available, so that the estimates are not always applicable.

The object of this paper is to give error estimates of approximate solutions in terms of approximate fundamental matrices and their approximate inverses. In Section 3 error estimates are obtained in the case where approximate fundamental matrices are continuous and also in the case where they are continuously differentiable. The results are illustrated with a numerical example.

In Section 4 we treat the case where the boundary condition depends on the fundamental matrices of the first variation equation of (1.1).

## 2. Notations and preliminaries

Let $R^{n}$ denote a real $n$-space with any norm $\|\cdot\|$ and let $C[J]$ be the Banach space of all real $n$-vector functions $x(t)$ continuous on the interval $J=[a, b]$ with the norm $\|x\|_{c}=\sup _{t \in J}\|x(t)\|$. For any fixed $t_{0} \in J$ let

$$
C_{0}[J]=\left\{x \in C[J] \quad \mid \quad x\left(t_{0}\right)=0\right\} .
$$

Then $B_{0}=C_{0}[J] \times R^{n}$ is a Banach space with the norm

$$
\|y\|_{b}=\max \left(\|u\|_{c},\|e\|\right) \quad \text { for } \quad y=(u, e) \in B_{0}
$$

Let $M[J]$ denote the Banach space of all real $n \times n$ matrix functions $A(t)$ continuous on $J$ with the norm $\|A\|_{c}=\sup _{t \in J}\|A(t)\|$.

The identity operator and the unit matrix are denoted by the same symbol $I$. The sum $F+G$ and the product $F G$ of two operators $F$ and $G$ are defined in the usual manner.

For two Banach spaces $X$ and $Y$, we denote by $L(X, Y)$ the set of all bounded linear operators from $X$ into $Y$. When the operator $F: D \subset X \rightarrow Y$ is Fréchet differentiable at $x \in D$, we denote by $F^{\prime}(x)$ the Fréchet derivative of $F$ at $x$. A linear operator $K: Y \rightarrow X$ is said to be invertible if the equation $K y=x$ has a unique solution $y \in Y$ for each $x \in X$. By the argument similar to the one used in [1, p. 50] we can show the following

Lemma 1. Let $L: X \rightarrow Y$ be a linear operator and $K: Y \rightarrow X$ be an invertible linear operator. Then $L$ is invertible if

$$
\begin{equation*}
\|I-L K\|<1 \tag{2.1}
\end{equation*}
$$

or

$$
\begin{equation*}
\|I-K L\|<1 \tag{2.2}
\end{equation*}
$$

Let $A=\left(a_{1}, a_{2}, \ldots, a_{n}\right) \in M[J]$ and for any $T \in L(C[J], C[J])$ define $T A$ $\in M[J]$ by

$$
T A=\left(T a_{1}, T a_{2}, \ldots, T a_{n}\right)
$$

Then we have

$$
\begin{equation*}
\|T A\|_{c} \leqq\|T\|_{c}\|A\|_{c} \tag{2.3}
\end{equation*}
$$

so that $T$ can be considered to be an element of $L(M[J], M[J])$.
Let $\Omega^{\prime}$ be a domain of the $t x$-space intercepted by two hyperplanes $t=a$ and $t=b$ such that the cross sections $R_{a}$ and $R_{b}$ at $t=a$ and $t=b$ make an open set in each hyperplane. Put $\Omega=R_{a} \cup \Omega^{\prime} \cup R_{b}$ and let

$$
D=\{x \in C[J] \quad \mid \quad(t, x(t)) \in \Omega \quad \text { for all } t \in J\}
$$

Let us consider the system of differential equations

$$
\begin{equation*}
\frac{d x}{d t}=X(x, t), \quad t \in J \tag{2.4}
\end{equation*}
$$

with the boundary condition

$$
\begin{equation*}
f[x]=0 \tag{2.5}
\end{equation*}
$$

where $x$ and $X(x, t)$ are $n$-vectors, $X(x, t)$ is continuous in $\Omega$ and continuously differentiable with respect to $x$ in $\Omega$, and the operator $f: D \rightarrow R^{n}$ is continuously Fréchet differentiable in $D$. We assume that (2.4) has at least one solution in $D$.

Let $Q: D \rightarrow C_{0}[J]$ and $F: D \rightarrow B_{0}$ be the operators defined by

$$
\begin{align*}
& Q x=x(t)-x\left(t_{0}\right)-\int_{t_{0}}^{t} X(x(s), s) d s \quad \text { for } \quad x \in D  \tag{2.6}\\
& F x=(Q x, f[x]) \quad \text { for } \quad x \in D . \tag{2.7}
\end{align*}
$$

Then the boundary value problem (2.4), (2.5) is equivalent to the problem of finding a solution $x \in D$ of the equation

$$
\begin{equation*}
F x=0 . \tag{2.8}
\end{equation*}
$$

Let $X_{x}(x, t)$ be the Jacobian matrix of $X(x, t)$ with respect to $x$. Then $F^{\prime}(x) h(x \in D)$ is given by

$$
\begin{equation*}
F^{\prime}(x) h=\left(Q^{\prime}(x) h, f^{\prime}(x) h\right) \quad \text { for } \quad h \in C[J] \tag{2.9}
\end{equation*}
$$

where

$$
\begin{equation*}
Q^{\prime}(x) h=h(t)-h\left(t_{0}\right)-\int_{t_{0}}^{t} X_{x}(x(s), s) h(s) d s \tag{2.10}
\end{equation*}
$$

Let $L \in L\left(C[J], B_{0}\right)$ be the operator independent of $x$ which approximates $F^{\prime}(x)$ and is defined by

$$
\begin{equation*}
L h=(P h, l[h]) \quad \text { for } \quad h \in C[J] \tag{2.11}
\end{equation*}
$$

where

$$
\begin{equation*}
P h=h(t)-h\left(t_{0}\right)-\int_{t_{0}}^{t} A(s) h(s) d s \tag{2.12}
\end{equation*}
$$

$A \in M[J]$ and $l \in L\left(C[J], R^{n}\right)$.
Let $\Phi(t)$ be the fundamental matrix of the system

$$
\frac{d y}{d t}=A(t) y
$$

with $\Phi\left(t_{0}\right)=I$ and put

$$
\begin{equation*}
G=l[\Phi] . \tag{2.13}
\end{equation*}
$$

We denote by $\Phi_{I}(t)$ the inverse matrix of $\Phi(t)$ and put

$$
\begin{equation*}
S=\Phi G^{-1} \tag{2.14}
\end{equation*}
$$

if $G$ is nonsingular.
Let $E, E_{1}, S_{1}$ and $H$ be the elements of $L(C[J], C[J])$ defined by

$$
\begin{gather*}
E h=\int_{t_{0}}^{t} \Phi(t) \Phi_{I}(s) h(s) d s \quad \text { for } \quad h \in C[J]  \tag{2.15}\\
E_{1}=I+E A, \quad S_{1}=I-S l, \quad H=S_{1} E \tag{2.16}
\end{gather*}
$$

and let $T: D \rightarrow C[J]$ and $T_{1}: D \rightarrow L(C[J], C[J])$ be the operators such that

$$
\begin{align*}
& T x=X(x(t), t)-A(t) x(t) \quad \text { for } \quad x \in D  \tag{2.17}\\
& T_{1}(x) h=\left\{X_{1}[x](t)-A(t)\right\} h(t) \quad \text { for } \quad x \in D, h \in C[J] \tag{2.18}
\end{align*}
$$

where

$$
\begin{equation*}
X_{1}[x]=X_{x}(x(t), t) \quad \text { for } \quad x \in D \tag{2.19}
\end{equation*}
$$

In our previous paper [2] we have shown the following results: $L$ has an inverse operator $L_{I}$ if and only if $\operatorname{det} G \neq 0$. If $G$ is nonsingular, then

$$
\begin{equation*}
L_{I} y=S_{1} E_{1} u+S e \quad \text { for } \quad y=(u, e) \in B_{0} \tag{2.20}
\end{equation*}
$$

where $K$ and $K_{1}$ are the operators from $D$ into $C[J]$ defined by

$$
\begin{align*}
& K=I-L_{I} F  \tag{2.22}\\
& K_{1}=H T+S(l-f) \tag{2.23}
\end{align*}
$$

Theorem 1. Let $x^{(0)} \in D$ be an approximate solution of (2.8) and suppose there exist an operator $L$, a positive number $\delta$ and nonnegative constants $\eta, \kappa$ $(\kappa<1)$ such that
(i) $\operatorname{det} G \neq 0$,
(ii) $\quad D_{\delta}=\left\{x \in C[J] \mid\left\|x-x^{(0)}\right\|_{c} \leqq \delta\right\} \subset D$,
(iii) $\|K x-K y\|_{c} \leqq \kappa\|x-y\|_{c} \quad$ for all $x, y \in D_{\delta}$,
(iv) $\left\|L_{I} F x^{(0)}\right\|_{c} \leqq \eta$,
(v) $\lambda=\eta /(1-\kappa) \leqq \delta$.

Then the sequence $\left\{x^{(k)}\right\}$ defined by

$$
\begin{equation*}
x^{(k+1)}=K x^{(k)} \quad(k=0,1, \ldots) \tag{2.24}
\end{equation*}
$$

converges to $\hat{x} \in D_{\delta}$ as $k \rightarrow \infty . \hat{x}$ is the unique solution of (2.8) in $D_{\delta}$, and

$$
\begin{equation*}
\left\|\hat{x}-x^{(k)}\right\|_{c} \leqq \kappa^{k} \lambda \quad(k=0,1, \ldots) \tag{2.25}
\end{equation*}
$$

Remark. Let $\kappa$ be a constant satisfying

$$
\begin{equation*}
\|H\|_{c} \mu_{1}+\|S\|_{c} \mu_{2} \leqq \kappa<1 \tag{2.26}
\end{equation*}
$$

where $\mu_{1}$ and $\mu_{2}$ are constants such that

$$
\begin{array}{lll}
\left\|T_{1}(x)\right\|_{c} \leqq \mu_{1} & \text { for all } & x \in D_{\delta} \\
\left\|f^{\prime}(x)-l\right\| \leqq \mu_{2} & \text { for all } & x \in D_{\delta} \tag{2.28}
\end{array}
$$

Then the condition (iii) is satisfied.
In this theorem the matrices $\Phi(t)$ and $\Phi_{I}(t)$ play important roles. But in practical applications we are often obliged to use the approximate fundamental matrices. In the next section we study how to modify this theorem in such a case.

## 3. Approximate fundamental matrices

Let $\tilde{\Phi}$ and $\tilde{\Phi}_{I}$ be the matrices that approximate $\Phi$ and $\Phi_{I}$ respectively. For any operator $R=R\left(\Phi, \Phi_{I}\right)$ depending on $\Phi$ and $\Phi_{I}$ we denote by $\tilde{R}$ the operator $R\left(\widetilde{\Phi}, \tilde{\Phi}_{I}\right)$. Put

$$
\begin{equation*}
\gamma(t)=\widetilde{\Phi}(t) \widetilde{\Phi}_{I}(t) \tag{3.1}
\end{equation*}
$$

$$
\begin{equation*}
\gamma_{1}(t)=I-\gamma(t) \tag{3.2}
\end{equation*}
$$

$$
\begin{equation*}
\rho=\max \left(b-t_{0}, t_{0}-a\right) \tag{3.3}
\end{equation*}
$$

We consider the following two cases for practical applications.
Case 1. $\tilde{\Phi}(t)$ and $\tilde{\Phi}_{I}(t)$ are continuous on $J$.
Case 2. $\tilde{\Phi}(t)$ and $\tilde{\Phi}_{I}(t)$ are continuously differentiable on $J$.

### 3.1. Case 1

Put

$$
\begin{align*}
& r(t)=\tilde{\Phi}(t)-I-\int_{t_{0}}^{t} A(s) \tilde{\Phi}(s) d s  \tag{3.4}\\
& r_{1}(t)=\tilde{\Phi}_{I}(t)-I+\int_{t_{0}}^{t} \tilde{\Phi}_{I}(s) A(s) d s \tag{3.5}
\end{align*}
$$

$$
\begin{equation*}
r_{2}(t)=\gamma_{1}(t)+\widetilde{\Phi}(t) r_{1}(t) . \tag{3.6}
\end{equation*}
$$

Let $R, R_{1} \in L(C[J], C[J])$ and $R_{2}: D \rightarrow C[J]$ be defined by

$$
\begin{align*}
& R h=r_{2}(t) \int_{t_{0}}^{t} h(s) d s-\tilde{\Phi}(t) \int_{t_{0}}^{t} r_{1}(s) h(s) d s \quad \text { for } h \in C[J],  \tag{3.7}\\
& R_{1} h=r_{2} h\left(t_{0}\right)+R A h \quad \text { for } h \in C[J],  \tag{3.8}\\
& R_{2} x=r_{2} x\left(t_{0}\right)+R X[x] \quad \text { for } x \in D, \tag{3.9}
\end{align*}
$$

where $X[x]=X(x(t), t)$. Then we have the following
Lbmma 2. $\tilde{L}_{I}$ exists and is invertible if

$$
\begin{align*}
& \operatorname{det} \tilde{G} \neq 0  \tag{3.10}\\
& \left\|\tilde{G}^{-1}\right\|\|l\|\|r\|_{c} \exp \left(\rho\|A\|_{c}\right)<1,  \tag{3.11}\\
& \left\|\tilde{S}_{1} R_{1}\right\|_{c}<1 . \tag{3.12}
\end{align*}
$$

Proof. By (3.10) $\tilde{L}_{I}$ can be defined.
Let $\alpha(t)=\tilde{\Phi}(t)-\Phi(t)$. Since

$$
\Phi(t)-I-\int_{t_{0}}^{t} A(s) \Phi(s) d s=0
$$

by (3.4) we have

$$
\alpha(t)=r(t)+\int_{t_{0}}^{t} A(s) \alpha(s) d s
$$

which yields

$$
\|\alpha(t)\| \leqq\|r\|_{c}+\left|\int_{t_{0}}^{t}\|A\|_{c}\|\alpha(s)\| d s\right|
$$

By Gronwall's inequality we have

$$
\begin{equation*}
\|\tilde{\Phi}-\Phi\|_{c} \leqq\|r\|_{c} \exp \left(\rho\|A\|_{c}\right) \tag{3.13}
\end{equation*}
$$

and by (3.11)

$$
\left\|\tilde{G}^{-1}\right\|\|\tilde{G}-\boldsymbol{G}\| \leqq\left\|\boldsymbol{G}^{-1}\right\|\|l\|\|\alpha\|_{c}<1
$$

Hence $\operatorname{det} G \neq 0$, and $L$ is invertible.
We show next that

$$
\begin{equation*}
\left\|I-\tilde{L}_{I} L\right\|_{c}<1 . \tag{3.14}
\end{equation*}
$$

Let

$$
\begin{equation*}
\beta(t)=\tilde{\Phi}_{I}(t)-\Phi_{I}(t), \quad q(t)=\int_{t_{0}}^{t} \beta(s) A(s) d s \tag{3.15}
\end{equation*}
$$

Then by (3.5)

$$
\begin{equation*}
\beta(t)+q(t)=r_{1}(t) \tag{3.16}
\end{equation*}
$$

because

$$
\Phi_{I}(t)-I+\int_{t_{0}}^{t} \Phi_{I}(s) A(s) d s=0
$$

For any $p \in C[J]$ let $u(t)=\int_{t_{0}}^{t} p(s) d s$. Since $\Phi_{I}^{\prime}=-\Phi_{I} A$, the integration by parts shows that

$$
\begin{align*}
& \int_{t_{0}}^{t} \Phi_{I}(s) A(s) u(s) d s=-\Phi_{I}(t) u(t)+\int_{t_{0}}^{t} \Phi_{I}(s) p(s) d s,  \tag{3.17}\\
& \int_{t_{0}}^{t} \beta(s) A(s) u(s) d s=q(t) u(t)-\int_{t_{0}}^{t} q(s) p(s) d s .
\end{align*}
$$

By (3.15)-(3.18) we have

$$
\begin{align*}
\tilde{E} A u & =\tilde{\Phi}(t)\left\{\int_{t_{0}}^{t} \Phi_{I}(s) A(s) u(s) d s+\int_{t_{0}}^{t} \beta(s) A(s) u(s) d s\right\}  \tag{3.19}\\
& =-u+\tilde{E} p+R p
\end{align*}
$$

From this and (3.8) it follows that

$$
\begin{equation*}
\tilde{E}_{1} P h=h-\tilde{\Phi} h\left(t_{0}\right)-R_{1} h \quad \text { for } \quad h \in C[J] . \tag{3.20}
\end{equation*}
$$

Since by (2.13) and (2.14)

$$
\begin{equation*}
\tilde{S}_{1} \tilde{\Phi}=\left(I-\tilde{\Phi} \tilde{G}^{-1} l\right) \tilde{\Phi}=0 \tag{3.21}
\end{equation*}
$$

by (2.20), (3.20) and (3.21) we have

$$
\left(I-\tilde{L}_{I} L\right) h=h-\tilde{S}_{1} \tilde{E}_{1} P h-\tilde{S} l[h]=\tilde{S}_{1} R_{1} h
$$

Hence (3.14) is valid by (3.12), and $\tilde{L}_{I}$ is invertible by Lemma 1.
Lemma 3. If $\operatorname{det} \tilde{G} \neq 0$, then

$$
\begin{equation*}
\tilde{K} x=\tilde{K}_{1} x+\tilde{K}_{2} x \quad \text { for } \quad x \in D \tag{3.22}
\end{equation*}
$$

where

$$
\begin{equation*}
\tilde{K}_{2} x=\tilde{S}_{1} R_{2} x \quad \text { for } \quad x \in D \tag{3.23}
\end{equation*}
$$

Proof. For any $x \in D$ by (2.22), (2.20) and (2.7)

$$
\begin{equation*}
\tilde{K} x=\left(I-\tilde{L}_{I} F\right) x=x-\tilde{S}_{1} \tilde{E}_{1} Q x-\tilde{S} f[x] . \tag{3.24}
\end{equation*}
$$

By (3.19) we have

$$
\begin{equation*}
\tilde{E}_{1} Q x=x-\tilde{E} T x-\tilde{\Phi} x\left(t_{0}\right)-R_{2} x \tag{3.25}
\end{equation*}
$$

and by (3.21)

$$
\tilde{S}_{1} \tilde{E}_{1} Q x=x-\tilde{S} l[x]-\tilde{H} T x-\tilde{S}_{1} R_{2} x .
$$

Substitution of this into (3.24) yields (3.22) by (3.23).
We have the following
Theorem 2. Let $x^{(0)} \in D$ be an approximate solution of (2.8) and suppose there exist an operator $\tilde{L}_{I}$, a positive number $\delta$ and nonnegative constants $\eta$, $\kappa, \kappa_{1}, \kappa_{2}$ such that
(i) $\tilde{L}_{I}$ is invertible;
(ii) $D_{\delta}=\left\{x \in C[J] \mid\left\|x-x^{(0)}\right\|_{c} \leqq \delta\right\} \subset D$;
(iii) $\kappa=\kappa_{1}+\kappa_{2}<1$,

$$
\begin{equation*}
\|\tilde{H}\|_{c} \mu_{1}+\|\tilde{S}\|_{c} \mu_{2} \leqq \kappa_{1} \tag{3.26}
\end{equation*}
$$

$$
\begin{equation*}
\left\|\tilde{S}_{1} R\right\|_{c} \mu_{3}+\left\|\tilde{S}_{1} r_{2}\right\|_{c} \leqq \kappa_{2}, \tag{3.27}
\end{equation*}
$$

where $\mu_{1}, \mu_{2}$ and $\mu_{3}$ are constants such that

$$
\begin{array}{lll}
\left\|T_{1}(x)\right\|_{c} \leqq \mu_{1} & \text { for all } & x \in D_{\delta} \\
\left\|f^{\prime}(x)-l\right\| \leqq \mu_{2} & \text { for all } & x \in D_{\delta} \\
\left\|X_{1}[x]\right\|_{c} \leqq \mu_{3} & \text { for all } & x \in D_{\delta} \tag{3.30}
\end{array}
$$

(iv) $\left\|\tilde{L}_{I} F x^{(0)}\right\|_{c} \leqq \eta$;
(v) $\lambda=\eta /(1-\kappa) \leqq \delta$.

Then the conclusion of Theorem 1 is valid with $K$ replaced by $\tilde{K}$.
Proof. For any $x, y \in D_{\delta}$ by the mean value theorem we have

$$
\begin{align*}
& \tilde{K}_{1} x-\tilde{K}_{1} y=\tilde{H} \int_{0}^{1} T_{1}(y+\theta h) h d \theta+\tilde{S} \int_{0}^{1}\left\{l-f^{\prime}(y+\theta h)\right\} h d \theta,  \tag{3.31}\\
& R_{2} x-R_{2} y=R \int_{0}^{1} X_{1}[y+\theta h] h d \theta+r_{2} h\left(t_{0}\right) \tag{3.32}
\end{align*}
$$

where $h=x-y$. Since $y+\theta h \in D_{\delta}$, by (3.31), (3.28), (3.29) and (3.26)

$$
\left\|\tilde{K}_{1} x-\tilde{K}_{1} y\right\|_{c} \leqq\left(\|\tilde{H}\|_{c} \mu_{1}+\|\tilde{S}\|_{c} \mu_{2}\right)\|h\|_{c} \leqq \kappa_{1}\|x-y\|_{c}
$$

and by (3.23), (3.32), (3.30) and (3.27)

$$
\left\|\tilde{K}_{2} x-\tilde{K}_{2} y\right\|_{c} \leqq\left(\left\|\tilde{S}_{1} R\right\|_{c} \mu_{3}+\left\|\tilde{S}_{1} r_{2}\right\|_{c}\right)\|h\|_{c} \leqq \kappa_{2}\|x-y\|_{c} .
$$

Hence by (3.22) and (iii)

$$
\|\tilde{K} x-\tilde{K} y\|_{c} \leqq \kappa\|x-y\|_{c} .
$$

Since $\kappa<1$, by the contraction mapping theorem [1, pp. 65-66] $\tilde{K}$ has a unique fixed point $\hat{x}$ in $D_{\delta}$ and the estimate (2.25) holds. From $\hat{x}=\tilde{K} \hat{x}$ it follows that $\tilde{L}_{I} F \hat{x}=0$, which is equivalent to $F \hat{x}=0$ by (i). Since any solution of $F x=0$ is a fixed point of $\tilde{K}, \hat{x}$ is the unique solution of (2.8) in $D_{\boldsymbol{\delta}}$. This completes the proof.

Let $\alpha_{0}$ and $\alpha_{1}$ be constants such that

$$
\begin{align*}
& \rho\left(\left\|r_{2}\right\|_{c}\|A\|_{c}+\|\tilde{\Phi}\|_{c}\left\|r_{1} A\right\|_{c}\right) \leqq \alpha_{0}  \tag{3.33}\\
& \rho\left(\left\|r_{2}\right\|_{c}+\|\tilde{\Phi}\|_{c}\left\|r_{1}\right\|_{c}\right) \leqq \alpha_{1} . \tag{3.34}
\end{align*}
$$

Then by (3.7) for any $h \in C[J]$

$$
\|R A h\|_{c} \leqq \alpha_{0}\|h\|_{c}, \quad\|R h\|_{c} \leqq \alpha_{1}\|h\|_{c} .
$$

Hence (3.12) and (3.27) can be replaced respectively by

$$
\begin{align*}
& \left\|\tilde{S}_{1}\right\|_{c} \alpha_{0}+\left\|\tilde{S}_{1} r_{2}\right\|_{c}<1,  \tag{3.35}\\
& \left\|\tilde{S}_{1}\right\|_{c} \alpha_{1} \mu_{3}+\left\|\tilde{S}_{1} r_{2}\right\|_{c} \leqq \kappa_{2} . \tag{3.36}
\end{align*}
$$

### 3.2. Case 2

Put

$$
\begin{align*}
& A_{1}(t)=\tilde{\Phi}^{\prime}(t) \tilde{\Phi}^{-1}(t)  \tag{3.37}\\
& A_{2}(t)=-\tilde{\Phi}_{I}^{-1}(t) \tilde{\Phi}_{I}^{\prime}(t) \tag{3.38}
\end{align*}
$$

Let $P_{2}, R_{3}, R_{4} \in L(C[J], C[J])$ and $R_{5}: D \rightarrow C[J]$ be defined by

$$
\begin{equation*}
R_{3} h=\tilde{E}\left(A-A_{2}\right) h+\gamma_{1} h \quad \text { for } \quad h \in C[J] \tag{3.40}
\end{equation*}
$$

$$
\begin{equation*}
P_{2} h=h(t)-h\left(t_{0}\right)-\int_{t_{0}}^{t} A_{1}(s) h(s) d s \quad \text { for } \quad h \in C[J] \tag{3.39}
\end{equation*}
$$

$$
\begin{equation*}
R_{4} h=R_{3}\left(h-P_{2} h\right)-\tilde{E}\left(A-A_{1}\right) h \quad \text { for } \quad h \in C[J] \tag{3.41}
\end{equation*}
$$

$$
\begin{equation*}
R_{5} x=R_{3}(x-Q x) \quad \text { for } \quad x \in D \tag{3.42}
\end{equation*}
$$

Then we have the following
Lemma 4. Let

$$
\begin{equation*}
\operatorname{det} \boldsymbol{G} \neq 0 \tag{3.43}
\end{equation*}
$$

Then $\tilde{L}_{I}$ is invertible if

$$
\begin{equation*}
\rho\left\|A_{1}-\gamma A\right\|_{c}<1 \tag{3.44}
\end{equation*}
$$

or

$$
\begin{equation*}
\left\|\tilde{S}_{1} R_{4}\right\|_{c}<1 \tag{3.45}
\end{equation*}
$$

Proof. Let $L_{1}$ be the operator defined by

$$
L_{1} h=\left(P_{2} h, l[h]\right) \quad \text { for } \quad h \in C[J] .
$$

Then it is invertible by (3.43).
For any $y=(u, e) \in B_{0}$ by (2.20)

$$
\begin{equation*}
\tilde{L}_{I} y=\widetilde{E}_{1} u-\tilde{S}\left\{l\left[\widetilde{E}_{1} u\right]-e\right\} . \tag{3.46}
\end{equation*}
$$

Since $P_{2} \tilde{\Phi}=0$ and $\tilde{G}=l[\tilde{\Phi}]$, we have

$$
\begin{align*}
& P_{2} \tilde{S}=\left(P_{2} \tilde{\Phi}\right) \tilde{G}^{-1}=0  \tag{3.47}\\
& l[\tilde{S}]=l[\tilde{\Phi}] \tilde{G}^{-1}=I \tag{3.48}
\end{align*}
$$

Suppose first (3.44) holds. By (3.46) and (3.48)

$$
\begin{equation*}
l\left[\tilde{L}_{I} y\right]=e \tag{3.49}
\end{equation*}
$$

By (3.46) and (3.47) the integration by parts yields

$$
P_{2} \tilde{L}_{I} y=P_{2} \tilde{E}_{1} u=u(t)-\int_{t_{0}}^{t}\left\{A_{1}(s)-\gamma(s) A(s)\right\} u(s) d s
$$

because $\tilde{\Phi}^{\prime}=A_{1} \tilde{\Phi}$ and $u \in C_{0}[J]$. By this and (3.49) we have

$$
\begin{equation*}
\left(I-L_{1} \tilde{L}_{I}\right) y=\left(\int_{t_{0}}^{t}\left\{A_{1}(s)-\gamma(s) A(s)\right\} u(s) d s, 0\right) \tag{3.50}
\end{equation*}
$$

Hence

$$
\left\|\left(I-L_{1} \tilde{L}_{I}\right) y\right\|_{b} \leqq \rho\left\|A_{1}-\gamma A\right\|_{c}\|y\|_{b}
$$

and $\tilde{L}_{I}$ is invertible by (3.44) and Lemma 1.

We treat next the case where (3.45) is valid. For any $q \in C[J]$ let $u(t)=$ $\int_{t_{0}}^{t} q(s) d s$. Since $\tilde{\Phi}_{I}^{\prime}=-\widetilde{\Phi}_{I} A_{2}$, by integration by parts we have

$$
\begin{equation*}
\tilde{E} A u=\tilde{E}\left(A-A_{2}\right) u-\gamma u+\tilde{E} q=-u+R_{3} u+\tilde{E} q \tag{3.51}
\end{equation*}
$$

so that

$$
\begin{equation*}
\tilde{E}_{1} P_{2} h=h-\tilde{\Phi} \tilde{\Phi}_{I}\left(t_{0}\right) h\left(t_{0}\right)-R_{4} h \quad \text { for } \quad h \in C[J] . \tag{3.52}
\end{equation*}
$$

Substitution of $u=P_{2} h$ and $e=l[h]$ into (3.46) yields by (3.52) and (3.21)

$$
\left(I-\tilde{L}_{I} L_{1}\right) h=\tilde{S}_{1} R_{4} h
$$

Hence $\tilde{L}_{I}$ is invertible by (3.45) and Lemma 1.
Lbmma 5. If $\operatorname{det} \tilde{G} \neq 0$, then

$$
\begin{equation*}
\tilde{K} x=\tilde{K}_{1} x+\tilde{K}_{2} x \quad \text { for } \quad x \in D \tag{3.53}
\end{equation*}
$$

where

$$
\begin{equation*}
\tilde{K}_{2} x=\tilde{S}_{1} R_{5} x \quad \text { for } \quad x \in D \tag{3.54}
\end{equation*}
$$

Proof. For any $x \in D$ by (3.51) we have

$$
\begin{equation*}
\tilde{E}_{1} Q x=x-\tilde{E} T x-\tilde{\Phi} \tilde{\Phi}_{I}\left(t_{0}\right) x\left(t_{0}\right)-R_{5} x . \tag{3.55}
\end{equation*}
$$

By (2.20) and (3.21)

$$
\begin{aligned}
\tilde{L}_{I} F x & =\tilde{S}_{1} \tilde{E}_{1} Q x+\tilde{S} f[x] \\
& =x-\tilde{H} T x-\tilde{S}(l[x]-f[x])-\tilde{S}_{1} R_{5} x
\end{aligned}
$$

from which (3.53) follows.
We have the following
Theorem 3. Suppose the assumptions of Theorem 2 are satisfied with (3.27) replaced by

$$
\begin{equation*}
\left\|\tilde{S}_{1} R_{3}\right\|_{c}\left(1+\rho \mu_{3}\right) \leqq \kappa_{2} \tag{3.56}
\end{equation*}
$$

Then the conclusion of Theorem 2 is valid.
Proof. For any $x, y \in D_{\delta}$ let $h=x-y$. Then by the mean value theorem

$$
\begin{equation*}
R_{5} x-R_{5} y=R_{3} \int_{0}^{1}\left\{I-Q^{\prime}(y+\theta h)\right\} h d \theta \tag{3.57}
\end{equation*}
$$

Since $y+\theta h \in D_{\delta}$, we have by (3.30)

$$
\begin{aligned}
\left\|\left\{I-Q^{\prime}(y+\theta h)\right\} h\right\|_{c} & =\left\|h\left(t_{0}\right)-\int_{t_{0}}^{t} X_{1}[y+\theta h](s) h(s) d s\right\|_{c} \\
& \leqq\left(1+\rho \mu_{3}\right)\|h\|_{c} \quad \text { for all } \quad \theta \in[0,1]
\end{aligned}
$$

and by (3.54), (3.57) and (3.56)

$$
\left\|\tilde{K}_{2} x-\tilde{K}_{2} y\right\|_{c} \leqq\left\|\tilde{S}_{1} R_{3}\right\|_{c}\left(1+\rho \mu_{3}\right)\|h\|_{c} \leqq \kappa_{2}\|x-y\|_{c} .
$$

The proof is completed by the same argument as in the proof of Theorem 2.
Suppose $\left\|\gamma_{1}\right\|_{c}<1$ and let $\sigma=1 /\left(1-\left\|\gamma_{1}\right\|_{c}\right)$. Then since $\left\|\gamma^{-1}\right\|_{c} \leqq \sigma$ we have the following inequalities:

$$
\begin{align*}
& \left\|A_{1}-\gamma A\right\|_{c} \leqq \sigma\left\|\tilde{\Phi}^{\prime} \tilde{\Phi}_{I}-\gamma A \gamma\right\|_{c}  \tag{3.58}\\
& \left\|A-A_{1}\right\|_{c} \leqq \sigma\left\|A \gamma-\tilde{\Phi}^{\prime} \tilde{\Phi}_{I}\right\|_{c}  \tag{3.59}\\
& \left\|A-A_{2}\right\|_{c} \leqq \sigma\left\|\gamma A+\tilde{\Phi} \tilde{\Phi}_{I}^{\prime}\right\|_{c}  \tag{3.60}\\
& \left\|A_{1}\right\|_{c} \leqq \sigma\left\|\tilde{\Phi}^{\prime} \tilde{\Phi}_{I}\right\|_{c} \tag{3.61}
\end{align*}
$$

For any constant $\alpha_{2}$ such that

$$
\begin{equation*}
\|\tilde{H}\|_{c}\left\|A-A_{2}\right\|_{c}+\left\|\tilde{S}_{1}\right\|_{c}\left\|\gamma_{1}\right\|_{c} \leqq \alpha_{2} \tag{3.62}
\end{equation*}
$$

we have

$$
\left\|\tilde{S}_{1} R_{3} h\right\|_{c} \leqq \alpha_{2}\|h\|_{c} \quad \text { for } \quad h \in C[J],
$$

so that

$$
\begin{align*}
& \left\|\tilde{S}_{1} R_{4}\right\|_{c} \leqq \alpha_{2}\left(1+\rho\left\|A_{1}\right\|_{c}\right)+\|\tilde{H}\|_{c}\left\|A-A_{1}\right\|_{c}  \tag{3.63}\\
& \left\|\tilde{S}_{1} R_{3}\right\|_{c}\left(1+\rho \mu_{3}\right) \leqq \alpha_{2}\left(1+\rho \mu_{3}\right) \tag{3.64}
\end{align*}
$$

Hence by (3.58)-(3.61), we can estimate the left sides of (3.44), (3.45) and (3.56) without computing $\tilde{\Phi}^{-1}$ and $\tilde{\Phi}_{I}^{-1}$.

### 3.3. Treatment in the original form

In this subsection we treat the boundary value problem (2.4), (2.5) directly without replacing (2.4) by a system of integral equations.

Let $C^{1}[J]$ denote the space of all real $n$-vector functions continuously differentiable on $J$ with the norm $\|\cdot\|_{c}$ and let

$$
D^{1}=\left\{x \in C^{1}[J] \quad \mid \quad(t, x(t)) \in \Omega \quad \text { for all } t \in J\right\}
$$

Let $B=C[J] \times R^{n}$ be a Banach space with the norm

$$
\|y\|_{b}=\max \left(\|u\|_{c},\|e\|\right) \quad \text { for } \quad y=(u, e) \in B
$$

Let us consider the equation

$$
\begin{equation*}
\mathscr{F} x \equiv\left(\frac{d x}{d t}-X(x, t), f[x]\right)=0 \quad \text { for } \quad x \in D^{1} \tag{3.65}
\end{equation*}
$$

and introduce the linear operator $\mathscr{L}$ defined by

$$
\begin{equation*}
\mathscr{L} h=\left(\frac{d h}{d t}-A(t) h, l[h]\right) \quad \text { for } \quad h \in C^{1}[J] . \tag{3.66}
\end{equation*}
$$

The following results have been obtained in [4]: If $\operatorname{det} G \neq 0$, then $\mathscr{L}$ has an inverse operator $\mathscr{L}_{I}$, which is defined by

$$
\begin{equation*}
\mathscr{L}_{I} y=H u+S e \quad \text { for } \quad y=(u, e) \in B \tag{3.67}
\end{equation*}
$$

Let $\mathscr{K}$ and $\mathscr{K}_{1}$ be the operators from $D^{1}$ into $C^{1}[J]$ defined by

$$
\begin{array}{clll}
\mathscr{K} x=\left(I-\mathscr{L}_{I} \mathscr{F}\right) x & \text { for } & x \in D^{1} \\
\mathscr{K}_{1} x=\mathscr{L}_{I}(\mathscr{L}-\mathscr{F}) x & \text { for } & x \in D^{1} . \tag{3.69}
\end{array}
$$

Then

$$
\begin{equation*}
\mathscr{K} x=\mathscr{K}_{1} x=K_{1} x \quad \text { for } \quad x \in D^{1} . \tag{3.70}
\end{equation*}
$$

Suppose $\tilde{\Phi}$ and $\tilde{\Phi}_{I}$ are continuously differentiable on $J$ and let $\tilde{K}_{2}$ be the operator defined by

$$
\begin{equation*}
\tilde{K}_{2} x=\left\{\tilde{H}\left(A-A_{2}\right)+\tilde{S}_{1} \gamma_{1}\right\} x \quad \text { for } \quad x \in D^{1} . \tag{3.71}
\end{equation*}
$$

Then we have the following
Theorem 4. Let $x^{(0)} \in D^{1}$ be an approximate solution of (3.65) and suppose there exist an operator $\tilde{\mathscr{L}}_{I}$, a positive number $\delta$ and nonnegative constants $\eta, \kappa$ such that
(i) $\operatorname{det} \widetilde{G} \neq 0,\left\|\gamma_{1}\right\|_{c}<1$;
(ii) $D_{\delta}^{1}=\left\{x \in C^{1}[J] \mid\left\|x-x^{(0)}\right\|_{c} \leqq \delta\right\} \subset D^{1}$;
(iii) $\|\tilde{H}\|_{c} \mu_{1}+\|\tilde{S}\|_{c} \mu_{2}+\left\|\tilde{K}_{2}\right\|_{c} \leqq \kappa<1$,
where $\mu_{1}$ and $\mu_{2}$ are constants such that

$$
\begin{array}{lll}
\left\|T_{1}(x)\right\|_{c} \leqq \mu_{1} & \text { for all } & x \in D_{\delta}^{1} \\
\left\|f^{\prime}(x)-l\right\| \leqq \mu_{2} & \text { for all } & x \in D_{\delta}^{\frac{1}{\delta}}
\end{array}
$$

(iv) $\left\|\tilde{\mathscr{L}}_{I} \mathscr{F} x^{(0)}\right\|_{c} \leqq \eta$;
(v) $\lambda=\eta /(1-\kappa) \leqq \delta$.

Then the conclusion of Theorem 1 is valid with $K$ and $D_{\delta}$ replaced by $\tilde{\mathscr{K}}$ and $D_{\delta}^{1}$ respectively.

Proof. Let $\mathscr{L}_{1}$ be the operator from $C^{1}[J]$ into $B$ defined by

$$
\mathscr{L}_{1} h=\left(\frac{d h}{d t}-A_{1}(t) h, l[h]\right) \quad \text { for } \quad h \in C^{1}[J]
$$

Then by (i) $\mathscr{L}_{1}$ is invertible.
For any $y=(u, e) \in B$ we have by (3.67)

$$
\begin{equation*}
z=\tilde{\mathscr{L}}_{I} y=(I-\tilde{S} l) \tilde{E} u+\tilde{S} e=\tilde{E} u-\tilde{\Phi} \tilde{G}^{-1}(l[\tilde{E} u]-e) \tag{3.72}
\end{equation*}
$$

and by (3.37)

$$
\begin{align*}
\frac{d z}{d t}= & A_{1}(t) \widetilde{\Phi}(t) \int_{t_{0}}^{t} \tilde{\Phi}_{I}(s) u(s) d s+\tilde{\Phi}(t) \widetilde{\Phi}_{I}(t) u(t)  \tag{3.73}\\
& -A_{1}(t) \widetilde{\Phi}(t) \tilde{G}^{-1}(l[\tilde{E} u]-e) \\
= & A_{1} z+\gamma u
\end{align*}
$$

Since $\tilde{G}=l[\tilde{\Phi}]$, from (3.72) it follows that

$$
\begin{equation*}
l[z]=l[\tilde{E} u]-l[\tilde{\Phi}] \tilde{G}^{-1}(l[\tilde{E} u]-e)=e . \tag{3.74}
\end{equation*}
$$

By (3.73) and (3.74) we have

$$
\left(I-\mathscr{L}_{1} \tilde{\mathscr{L}}_{I}\right) y=\left(\gamma_{1} u, 0\right),
$$

so that

$$
\left\|\left(I-\mathscr{L}_{1} \check{\mathscr{L}}_{I}\right) y\right\|_{b} \leqq\left\|\gamma_{1}\right\|_{c}\|y\|_{b} .
$$

Hence $\check{\mathscr{L}}_{I}$ is invertible by (i) and Lemma 1.
For any $x \in D^{1}$ by (3.69) and (3.67) we have

$$
\begin{equation*}
\widetilde{\mathscr{H}}_{1} x=\tilde{\mathscr{L}}_{I}(\mathscr{L}-\mathscr{F}) x=\tilde{H} T x+\tilde{S}(l[x]-f[x])=\widetilde{K}_{1} x \tag{3.75}
\end{equation*}
$$

and by (3.38)

$$
\tilde{E}\left\{\frac{d h}{d t}-A(t) h\right\}=\gamma h-\tilde{E}\left(A-A_{2}\right) h-\tilde{\Phi} \tilde{\Phi}_{I}\left(t_{0}\right) h\left(t_{0}\right)
$$

Hence by (3.21)

$$
\begin{equation*}
\left(I-\tilde{\mathscr{L}}_{I} \mathscr{L}\right) x=\left\{\tilde{H}\left(A-A_{2}\right)+(I-\tilde{S} l) \gamma_{1}\right\} x=\tilde{K}_{2} x \tag{3.76}
\end{equation*}
$$

and by (3.68), (3.75) and (3.76)

$$
\tilde{\mathscr{K}} x=\tilde{\mathscr{L}}_{I}(\mathscr{L}-\mathscr{F}) x+\left(I-\tilde{\mathscr{L}}_{I} \mathscr{L}\right) x=\tilde{K}_{1} x+\tilde{K}_{2} x .
$$

For any $x, y \in D_{\delta}^{1}$ by (3.31) and (iii) we have

$$
\begin{aligned}
\|\widetilde{\mathscr{K}} x-\widetilde{\mathscr{K}} y\|_{c} & \leqq\left\{\|\tilde{H}\|_{c} \mu_{1}+\|\tilde{S}\|_{c} \mu_{2}+\left\|\tilde{K}_{2}\right\|_{c}\right\}\|x-y\|_{c} \\
& \leqq \kappa\|x-y\|_{c} .
\end{aligned}
$$

The proof is completed by the same argument as in the proof of Theorem 2.

### 3.4. A numerical example

We consider the two-point boundary value problem [3]

$$
\begin{gather*}
\frac{d x}{d t}=X(x, t) \equiv\binom{x_{2}}{-x_{1}-\left(x_{1}-t\right)^{3}+t+0.1} \quad(-1 \leqq t \leqq 1)  \tag{3.77}\\
f[x] \equiv\binom{x_{1}(-1)+0.9}{x_{1}(1)-1.1}=0 . \tag{3.78}
\end{gather*}
$$

Let

$$
\begin{equation*}
x_{1}^{(0)}(t)=t+0.1, \quad x_{2}^{(0)}(t)=1 \tag{3.79}
\end{equation*}
$$

be an approximate solution of this problem, $t_{0}=-1$,

$$
A(t)=\left(\begin{array}{rr}
0 & 1  \tag{3.80}\\
-1 & 0
\end{array}\right)
$$

and $l$ be the operator defined by

$$
l[h]=\left(\begin{array}{ll}
1 & 0  \tag{3.81}\\
0 & 0
\end{array}\right) h(-1)+\left(\begin{array}{ll}
0 & 0 \\
1 & 0
\end{array}\right) h(1) \quad \text { for } \quad h \in C[J] .
$$

Then

$$
\begin{gather*}
X_{x}(x, t)-A(t)=\left(\begin{array}{cc}
0 & 0 \\
-3\left(x_{1}-t\right)^{2} & 0
\end{array}\right),  \tag{3.82}\\
f^{\prime}(x)=l . \tag{3.83}
\end{gather*}
$$

For simplicity we put

$$
\begin{array}{lll}
c(t)=\cos (1+t), & s(t)=\sin (1+t), & u(t)=\cos (1-t), \\
v(t)=\sin (1-t), & p(t)=2 s(t) c(t), & q(t)=1-2 s(t)^{2},
\end{array}
$$

$$
m=10^{-3}, \quad \sigma=(1-c) / s, \quad s=\sin 2, \quad c=\cos 2
$$

For any constant $\varepsilon(|\varepsilon|<1)$ let $\mu=1+\varepsilon, v=1-\varepsilon$,

$$
\tilde{\Phi}(t)=\left(\begin{array}{rr}
\mu c(t) & \mu s(t)  \tag{3.84}\\
-\mu s(t) & v c(t)
\end{array}\right), \quad \tilde{\Phi}_{I}(t)=\left(\begin{array}{rr}
c(t) & -v s(t) \\
s(t) & \mu c(t)
\end{array}\right)
$$

Then by (3.81) and (3.84) we have

$$
\begin{gather*}
\tilde{G}=\mu\left(\begin{array}{ll}
1 & 0 \\
c & s
\end{array}\right), \quad \tilde{S}(t)=(\mu s)^{-1}\left(\begin{array}{ll}
\mu v(t) & \mu s(t) \\
-C(t) & v c(t)
\end{array}\right),  \tag{3.85}\\
\tilde{H} h=\int_{-1}^{1} \tilde{H}(t, \tau) h(\tau) d \tau \quad \text { for } \quad h \in C[J] \tag{3.86}
\end{gather*}
$$

where

$$
\begin{aligned}
& \tilde{H}(t, \tau)=s^{-1}\left(\begin{array}{lr}
\mu v(t) c(\tau) & -\mu v v(t) s(\tau) \\
-C(t) c(\tau) & v C(t) s(\tau)
\end{array}\right) \quad(-1 \leqq \tau<t \leqq 1), \\
& \tilde{H}(t, \tau)=-s^{-1}\left(\begin{array}{lr}
\mu s(t) u(\tau) & \mu s(t) D(\tau) \\
v c(t) u(\tau) & v c(t) D(\tau)
\end{array}\right) \quad(-1 \leqq t \leqq \tau \leqq 1), \\
& C(t)=u(t)-\varepsilon \cos (3+t), \quad D(\tau)=v(\tau)+\varepsilon \sin (3+\tau) .
\end{aligned}
$$

## Hence

$$
\begin{align*}
& \tilde{L}_{I} F x^{(0)}=m\binom{\mu\{1-c(t)-\sigma s(t)\}}{v\{s(t)-\sigma c(t)\}+\varepsilon\{(1+t) q(t)+2 s(t)-p(t)\}},  \tag{3.87}\\
& \tilde{K}_{1} x^{(0)}=\binom{\alpha s(t)+\beta c(t)+\varepsilon \mu p(t)+\mu(1-\varepsilon q(t))(t+0.099)}{v \alpha c(t) / \mu-\beta s(t)+\mu \nu}, \tag{3.88}
\end{align*}
$$

$$
\begin{equation*}
\tilde{\mathscr{L}}_{I} \mathscr{F} x^{(0)}=m\binom{\mu\left\{1-v c(t)-\sigma_{1} s(t)-\varepsilon q(t)\right\}}{v\left\{\mu s(t)-\sigma_{1} c(t)\right\}}, \tag{3.89}
\end{equation*}
$$

where

$$
\begin{aligned}
& \alpha=m \sigma+\varepsilon\{\varepsilon(0.901 c+1.099) / s-2 \mu(1.099 s+c)\} \\
& \beta=m-0.901 \varepsilon^{2}, \quad \sigma_{1}=\sigma+\varepsilon \sigma(1+2 c)
\end{aligned}
$$

We have

$$
\gamma_{1}(t)=\varepsilon\left(\begin{array}{cc}
-1 & -\mu p(t)  \tag{3.90}\\
p(t) & \varepsilon
\end{array}\right)
$$

$$
\gamma A+\tilde{\Phi} \tilde{\Phi}_{I}^{\prime}=\varepsilon\left(\begin{array}{cc}
-\mu p(t) & \mu q(t)  \tag{3.93}\\
\varepsilon-q(t) & -p(t)
\end{array}\right)
$$

$$
\tilde{\Phi}^{\prime} \tilde{\Phi}_{I}-\gamma A \gamma=\varepsilon\left(\begin{array}{cc}
\mu(1+\mu) p(t) & \mu\left\{\varepsilon+q(t)+\varepsilon \mu p(t)^{2}\right\}  \tag{3.94}\\
1-\varepsilon \mu-q(t)-\varepsilon p(t)^{2} & \mu v(1+\mu) p(t)
\end{array}\right)
$$

Let us put $\varepsilon=10^{-3}$ and use the infinity norm $\|\cdot\|_{\infty}$. Then

$$
\begin{aligned}
& \|\tilde{H}\|_{\infty c} \leqq 2 \max _{t, s \in J}\|\tilde{H}(t, s)\|_{\infty} \leqq 3.11104 \\
& \mid \tilde{L}_{I} F x^{(0)} \|_{\infty c} \leqq \eta=1.55712 \mathrm{~m}
\end{aligned}
$$

By (3.82) and (3.83) we may choose

$$
\mu_{1}=3(\delta+0.1)^{2}, \quad u_{2}=0, \quad \mu_{3}=1+\mu_{1}
$$

In the remainder of this subsection we omit the subscript $\infty$ for simplicity.
(i) The case where Theorem 2 is applied.

We have

$$
\begin{aligned}
& \left\|\widetilde{G}^{-1}\right\| \leqq 1.55586, \quad\|r\|_{c} \leqq 3.0 m, \quad\left\|r_{1}\right\|_{c} \leqq 2.32544 m, \quad\left\|r_{2}\right\|_{c} \leqq 2.12613 m \\
& \left\|\widetilde{S}_{1} r_{2}\right\|_{c} \leqq 2.81522 m, \quad\left\|\tilde{S}_{1}\right\|_{c} \leqq 3.1995, \quad\|\tilde{\Phi}\|_{c} \leqq 1.41563 \\
& \left\|\tilde{G}^{-1}\right\|\|l\|\|r\|_{c} \exp \left(2\|A\|_{c}\right) \leqq 0.0689 \\
& \left.2\left\|\tilde{S}_{1}\right\|_{c}\left\|r_{2}\right\|_{c}+\|\tilde{\Phi}\|_{c}\left\|r_{1}\right\|_{c}\right)+\left\|\tilde{S}_{1} r_{2}\right\|_{c} \leqq 0.0375
\end{aligned}
$$

so that $\tilde{L}_{I}$ is invertible by Lemma 2.
The choice $\delta=1.8008 \mathrm{~m}$ yields

$$
\kappa=0.13528, \quad \lambda=\eta /(1-\kappa)=1.80074 m=\lambda_{1},
$$

and an error estimate $\left\|\hat{x}-x^{(0)}\right\|_{c} \leqq \lambda_{1}$ is obtained.
(ii) The case where Theorem 3 is applied.

We have

$$
\begin{equation*}
\left\|\gamma_{1}\right\|_{c} \leqq 2.001 m, \quad\left\|\tilde{\Phi}^{\prime} \tilde{\Phi}_{I}-\gamma A \gamma\right\|_{c} \leqq 3.23516 m \tag{3.95}
\end{equation*}
$$

Hence by (3.58) and Lemma $4 \tilde{L}_{I}$ is invertible. The constant $\kappa_{2}$ is determined with the aid of (3.60) and (3.64). With the choice $\delta=1.79 \mathrm{~m}$ we have

$$
\kappa=0.12982, \quad \lambda=1.78942 m=\lambda_{2} .
$$

Now we consider two cases where Theorem 1 is applied incorrectly with $\boldsymbol{\Phi}$ and $\tilde{\Phi}_{I}$ regarded as $\Phi$ and $\Phi_{I}$ respectively.
(iii) The case where Theorem 1 is applied with $\tilde{K}$ regarded as $K$.

The choice $\delta=1.724 \mathrm{~m}$ yields

$$
\kappa=0.096576, \quad \lambda=1.72357 m=\lambda_{3} .
$$

In this case $\tilde{K}_{2}$ is neglected, so that $\lambda_{3}$ is not necessarily a bound of $\left\|\hat{x}-x^{(0)}\right\|_{c}$.
(iv) The case where Theorem 1 is applied with $\widetilde{K}_{1}$ regarded as $K$.

We have

$$
\left\|\tilde{K}_{1} x^{(0)}-x^{(0)}\right\|_{c} \leqq \eta_{1}=1.07349 m,
$$

and the choice $\eta=\eta_{1}$ and $\delta=1.187 \mathrm{~m}$ leads to

$$
\kappa=0.09556, \quad \lambda=1.18691 m=\lambda_{4} .
$$

It is to be noted that $\lambda_{4}$ is a bound of $\left\|\hat{y}-x^{(0)}\right\|_{c}$ and is not always that of $\| \hat{x}-$ $x^{(0)} \|_{c}$, where $\hat{y}$ is the limit of the sequence $y^{(k)}$ defined by $y^{(k+1)}=\tilde{K}_{1} y^{(k)}$ ( $k=0,1, \ldots$ ) with $y^{(0)}=x^{(0)}$. Hence the use of the iteration

$$
x^{(k+1)}=K_{1} x^{(k)} \quad(k=0,1, \ldots)
$$

is not recommended, though (2.21) is valid.
(v) The case where Theorem 1 is applied with $\varepsilon=0$.

In this case $\tilde{\Phi}$ and $\tilde{\Phi}_{I}$ are identical with $\Phi$ and $\Phi_{I}$ respectively. We have

$$
\|H\|_{c} \leqq 3.11056, \quad\left\|L_{I} F x^{(0)}\right\|_{c} \leqq \eta_{2}=1.55741 m
$$

and the choice $\eta=\eta_{2}$ and $\delta=1.7239 \mathrm{~m}$ yields

$$
\kappa=0.096561, \quad \lambda=1.72387 m=\lambda_{5} .
$$

(vi) The case where Theorem 4 is applied.

Since $\operatorname{det} \widetilde{G}=\mu s \neq 0$, by (3.95) the condition (i) of Theorem 4 is satisfied and $\check{\mathscr{L}}_{I}$ is invertible. From (3.62) and (3.71) it follows that $\left\|K_{2}\right\|_{c} \leqq \alpha_{2}$. We have

$$
\left\|\tilde{\mathscr{L}}_{I} \mathscr{F} x^{(0)}\right\|_{c} \leqq \eta_{3}=1.55687 m, \quad \alpha_{2}=10.81511 m
$$

and the choice $\eta=\eta_{3}$ and $\delta=1.745 \mathrm{~m}$ leads to

$$
\kappa=0.107432, \quad \lambda=1.744 m=\lambda_{6} .
$$

It seems that $\lambda_{1}, \lambda_{2}$ and $\lambda_{6}$ are not so greater than $\lambda_{5}$. It is to be noted that $\lambda_{3}$ differs slightly from $\lambda_{5}$ but $\lambda_{4}$ does much. It is seen that $\lambda_{1}>\lambda_{2}>\lambda_{6}>\lambda_{5}$. The same conclusions are valid also when the norms $\|\cdot\|_{2}$ and $\|\cdot\|_{1}$ are used. The results are listed in Table 1 , where $\tilde{\eta}=\eta / m, \tilde{\delta}=\delta / m, \tilde{\kappa}=10 \kappa$ and $\tilde{\lambda}=\lambda / m$.

Table 1.

| norm | $e$ | $c$ | i | ii | iii | iv | v |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 4. A special boundary value problem

### 4.1. Problems and notations

Let $W[J]=C[J] \times M[J]$ be a Banach space with the norm

$$
\|v\|_{w}=\max \left(p^{-1}\left\|v_{0}\right\|_{c}, q^{-1}\left\|v_{1}\right\|_{c}\right) \quad \text { for } \quad v=\left(v_{0}, v_{1}\right) \in W[J]
$$

where $p$ and $q$ are arbitrary positive constants. Let $B_{0}=C_{0}[J] \times M[J] \times R^{n}$ be a Banach space with the norm

$$
\|\varphi\|_{b}=\max \left(\left\|u_{0}\right\|_{c},\left\|u_{1}\right\|_{c},\|e\|\right) \quad \text { for } \quad \varphi=\left(u_{0}, u_{1}, e\right) \in B_{0}
$$

We assume that $X(x, t)$ is continuous in $\Omega$ and twice continuously differentiable with respect to $x$ in $\Omega$, and denote by $X_{x x}(x, t)$ the second Fréchet derivative of $X(x, t)$ with respect to $x$. For any $x \in D$ let $\Phi_{(x)}(t)$ be the fundamental matrix of the system

$$
\begin{equation*}
\frac{d z}{d t}=X_{x}(x(t), t) z \tag{4.1}
\end{equation*}
$$

with $\Phi_{(x)}\left(t_{0}\right)=I$, and put $D^{1}=D \times U$, where $U=\left\{\Phi_{(x)} \in M[J] \quad \mid \quad x \in D\right\}$.
Let us consider the boundary value problem (2.4) and

$$
\begin{equation*}
f[y]=0 \quad \text { for } \quad y=\left(x, \Phi_{(x)}\right) \tag{4.2}
\end{equation*}
$$

where the operator $f: D^{1} \rightarrow R^{n}$ is continuously Fréchet differentiable in $D^{1}$. For example, this problem arises from boundary value problems of the least squares type [2].

In the sequel the $C[J]$ - and $M[J]$-components of any element of $W[J]$ are represented with subscripts 0 and 1 respectively, so that $x=\left(x_{0}, x_{1}\right)$.

Let $F: D^{1} \rightarrow B_{0}$ be defined by

$$
\begin{equation*}
F x=\left(Q x_{0}, Q_{1} x, f[x]\right) \quad \text { for } \quad x \in D^{1} \tag{4.3}
\end{equation*}
$$

where

$$
\begin{equation*}
Q_{1} x=x_{1}(t)-I-\int_{t_{0}}^{t} X_{1}\left[x_{0}\right](s) x_{1}(s) d s \tag{4.4}
\end{equation*}
$$

$Q x_{0}$ and $X_{1}\left[x_{0}\right]$ are given by (2.6) and (2.19) respectively. Then the problem (2.4), (4.2) is equivalent to that of finding a solution $x \in D^{1}$ of the equation

$$
\begin{equation*}
F x=0 . \tag{4.5}
\end{equation*}
$$

Let $\hat{x} \in D^{1}$ be the exact solution of (4.5), and $x^{(0)} \in D^{1}$ be an approximate solution. Then our object is to estimate the error of $x_{0}^{(0)}$ and that of $x_{1}^{(0)}$. We denote by $\lambda(p, q)$ an error bound of $x^{(0)}$ such that $\left\|\hat{x}-x^{(0)}\right\|_{w} \leqq \lambda(p, q)$. Since

$$
\left\|\hat{x}-x^{(0)}\right\|_{w}=\max \left(p^{-1}\left\|\hat{x}_{0}-x_{0}^{(0)}\right\|_{c}, q^{-1}\left\|\hat{x}_{1}-x_{1}^{(0)}\right\|_{c}\right)
$$

we have estimates

$$
\left\|\hat{x}_{0}-x_{0}^{(0)}\right\|_{c} \leqq \lambda(1, q), \quad\left\|\hat{x}_{1}-x_{1}^{(0)}\right\|_{c} \leqq \lambda(p, 1) .
$$

The parameters $p$ and $q$ are introduced so as to make the bounds $\lambda(1, q)$ and $\lambda(p, 1)$ small.

Let

$$
V=\left(v_{1}, v_{2}, \ldots, v_{n}\right) \in M[J], \quad h \in C[J] .
$$

For a bilinear operator $N$ from $C[J]$ into $C[J]$ we define $N[h, V]$ by

$$
N[h, V]=\left(N\left[h, v_{1}\right], N\left[h, v_{2}\right], \ldots, N\left[h, v_{n}\right]\right) .
$$

For $Y_{i} \in L(C[J], C[J])(i=1,2, \ldots, n)$ let $Y \in L(C[J], M[J])$ be the operator defined by

$$
Y h=\left(Y_{1} h, Y_{2} h, \ldots, Y_{n} h\right)
$$

and let

$$
Y V=\left(Y_{1} V, Y_{2} V, \ldots, Y_{n} V\right) .
$$

For $x \in D^{1}$ the Fréchet derivative $F^{\prime}(x)$ is defined by

$$
\begin{equation*}
F^{\prime}(x) h=\left(Q^{\prime}\left(x_{0}\right) h_{0}, Q_{1}^{\prime}(x) h, f^{\prime}(x) h\right) \quad \text { for } \quad h \in W[J], \tag{4.6}
\end{equation*}
$$

where $Q^{\prime}\left(x_{0}\right) h_{0}$ is given by (2.10),
(4.7) $\quad Q_{1}^{\prime}(x) h=h_{1}-\int_{t_{0}}^{t} X_{1}\left[x_{0}\right](s) h_{1}(s) d s-\int_{t_{0}}^{t} X_{2}\left(x_{0}\right)\left[h_{0}, x_{1}\right](s) d s$,

$$
\begin{equation*}
f^{\prime}(x) h=f_{0}(x) h_{0}+f_{1}(x) h_{1} \tag{4.8}
\end{equation*}
$$

$$
\begin{equation*}
X_{2}\left(x_{0}\right)\left[h_{0}, x_{1}\right]=X_{x x}\left(x_{0}(t), t\right)\left[h_{0}(t), x_{1}(t)\right] \tag{4.9}
\end{equation*}
$$

$f_{0}$ and $f_{1}$ are partial Fréchet derivatives of $f$ with respect to $x_{0}$ and $x_{1}$ respectively.

Let $T_{2}: D^{1} \rightarrow L(C[J], M[J])$ be the operator such that

$$
\begin{equation*}
T_{2}(x) h=X_{2}\left(x_{0}\right)\left[h, x_{1}\right]-Y h \quad \text { for } \quad x \in D^{1}, \quad h \in C[J] . \tag{4.10}
\end{equation*}
$$

Let $L \in L\left(W[J], B_{0}\right)$ be the operator independent of $x$ which approximates $F^{\prime}(x)$ and is defined by

$$
\begin{equation*}
L h=\left(P h_{0}, P_{1} h, l[h]\right) \quad \text { for } \quad h \in W[J], \tag{4.11}
\end{equation*}
$$

where $P h_{0}$ is given by (2.12),

$$
\begin{equation*}
P_{1} h=h_{1}(t)-\int_{t_{0}}^{t} A(s) h_{1}(s) d s-\int_{t_{0}}^{t}\left[Y h_{0}\right](s) d s \tag{4.12}
\end{equation*}
$$

$$
\begin{equation*}
l[h]=l_{0}\left[h_{0}\right]+l_{1}\left[h_{1}\right], \tag{4.13}
\end{equation*}
$$

$Y \in L(C[J], M[J]), l_{0} \in L\left(C[J], R^{n}\right)$ and $l_{1} \in L\left(M[J], R^{n}\right)$.
Let $l_{2} \in L\left(C[J], R^{n}\right)$ be defined by

$$
\begin{equation*}
l_{2}=l_{0}+l_{1} E Y \tag{4.14}
\end{equation*}
$$

and put

$$
\begin{equation*}
G=l_{2}[\Phi] . \tag{4.15}
\end{equation*}
$$

When $\operatorname{det} G \neq 0$, we define the operators $S_{j}(j=0,1, \ldots, 5), H_{0}$ and $H_{1}$ by the following formulas:

$$
\begin{array}{llll}
S_{0}=\Phi G^{-1}, & S_{1}=E Y S_{0}, & S_{2}=S_{0} l_{1}, & S_{3}=S_{1} l_{1}-I  \tag{4.16}\\
S_{4}=I-S_{0} l_{2}, & S_{5}=E Y S_{4}, & H_{0}=S_{4} E, & H_{1}=S_{5} E
\end{array}
$$

In 4.2 an analogue of Theorem 1 is given for $x^{(0)}$ and in 4.3 the error of $x^{(0)}$ is estimated in terms of the approximate matrices of $\Phi$ and $\Phi_{I}$.

### 4.2. Exact fundamental matrices

We have the following
Lbmma 6. L has an inverse operator $L_{I}$ if and only if

$$
\begin{equation*}
\operatorname{det} G \neq 0 \tag{4.17}
\end{equation*}
$$

Suppose (4.17) is satisfied. Then for any $\varphi=\left(u_{0}, u_{1}, e\right) \in B_{0}$

$$
\begin{equation*}
L_{I} \varphi=h \tag{4.18}
\end{equation*}
$$

where

$$
\begin{equation*}
h_{i}=S_{i+4} E_{1} u_{0}-S_{i+2} E_{1} u_{1}+S_{i} e \quad(i=0,1) \tag{4.19}
\end{equation*}
$$

Proof. By (4.11) the equation $L h=\varphi$ is equivalent to the system

$$
\begin{equation*}
P h_{0}=u_{0} \tag{4.20}
\end{equation*}
$$

$$
\begin{equation*}
P_{1} h=u_{1} \tag{4.21}
\end{equation*}
$$

The general solution of (4.20) is given by

$$
\begin{equation*}
h_{0}=\Phi c+E_{1} u_{0} \tag{4.23}
\end{equation*}
$$

with an arbitrary $c \in R^{n}$. The solution of (4.21) is

$$
h_{1}=E_{1} u_{1}+E Y h_{0},
$$

and substitution of (4.23) into this yields

$$
\begin{equation*}
h_{1}=E_{1} u_{1}+E Y E_{1} u_{0}+E Y \Phi c \tag{4.24}
\end{equation*}
$$

By (4.15), (4.23) and (4.24) from (4.22) it follows that

$$
l_{2}\left[E_{1} u_{0}\right]+l_{1}\left[E_{1} u_{1}\right]+G c=e
$$

Hence $L_{I}$ exists and is unique if and only if $c$ is determined uniquely for $\varphi \in B_{0}$, that is, $\operatorname{det} G \neq 0$.

If (4.17) holds, then

$$
c=G^{-1}\left\{e-l_{2}\left[E_{1} u_{0}\right]-l_{1}\left[E_{1} u_{1}\right]\right\} .
$$

Substituting this into (4.23) and (4.24) we have (4.18) and the proof is complete.
Let $K$ and $K_{1}$ be the operators from $D^{1}$ into $W[J]$ defined by

$$
\begin{align*}
& K=I-L_{I} F,  \tag{4.25}\\
& K_{1} x=y \quad \text { for } \quad x \in D^{1}, \tag{4.26}
\end{align*}
$$

where

$$
\begin{array}{r}
y_{i}=H_{i} T x_{0}-S_{i+2} E\left\{T_{1}\left(x_{0}\right) x_{1}-Y x_{0}\right\}+S_{i}(l[x]-f[x])-S_{i+2} \Phi  \tag{4.27}\\
(i=0,1),
\end{array}
$$

$T$ and $T_{1}\left(x_{0}\right)$ are given by (2.17) and (2.18) respectively. The integration by parts yields

$$
\begin{aligned}
& E_{1} Q x_{0}=x_{0}-E T x_{0}-\Phi x_{0}\left(t_{0}\right), \\
& E_{1} Q_{1} x=x_{1}-E T_{1}\left(x_{0}\right) x_{1}-\Phi \quad \text { for } \quad x \in D^{1} .
\end{aligned}
$$

Since $S_{i+4} \Phi=0(i=0,1)$, by (4.3) and (4.19) we have

$$
\begin{equation*}
K x=K_{1} x \quad \text { for } \quad x \in D^{1} . \tag{4.28}
\end{equation*}
$$

We have the following analogue of Theorem 1.
Theorem 5. Let $x^{(0)} \in D^{1}$ be an approximate solution of (4.5) and suppose there exist an operator L, a positive number $\delta$ and nonnegative constants $\eta, \kappa$ such that
(i) $\operatorname{det} G \neq 0$;
(ii) $D_{\delta}^{1}=\left\{x \in W[J] \quad \mid \quad\left\|x-x^{(0)}\right\|_{w} \leqq \delta\right\} \subset D^{1}$;
(iii) $\kappa=\max \left(p^{-1} \kappa_{0}, q^{-1} \kappa_{1}\right)<1$,
where $\kappa_{0}$ and $\kappa_{1}$ are constants satisfying

$$
\begin{equation*}
p\left\|H_{i}\right\|_{c} \mu_{1}+\left\|S_{i}\right\|_{c} \mu_{2}+\left\|S_{i+2} E\right\|_{c}\left(q \mu_{1}+p \mu_{4}\right) \leqq \kappa_{i} \quad(i=0,1), \tag{4.29}
\end{equation*}
$$

and $\mu_{1}, \mu_{2}$ and $\mu_{4}$ are constants such that

$$
\begin{equation*}
\left\|T_{1}\left(x_{0}\right)\right\|_{c} \leqq \mu_{1} \quad \text { for all } \quad x \in D_{\frac{1}{\delta}}^{1} \tag{4.30}
\end{equation*}
$$

$$
\begin{array}{lll}
\left\|f^{\prime}(x)-l\right\| \leqq \mu_{2} & \text { for all } & x \in D_{\delta}^{1} \\
\left\|T_{2}(x)\right\|_{c} \leqq \mu_{4} & \text { for all } & x \in D_{\delta}^{1} \tag{4.32}
\end{array}
$$

(iv) $\left\|L_{I} F x^{(0)}\right\|_{w} \leqq \eta$;
(v) $\lambda=\eta /(1-\kappa) \leqq \delta$.

Then the sequence $\left\{x^{(k)}\right\}$ defined by

$$
\begin{equation*}
x^{(k+1)}=K x^{(k)} \quad(k=0,1, \ldots) \tag{4.33}
\end{equation*}
$$

remains in $D_{\delta}^{1}$ and converges to $\hat{x} \in D_{\delta}^{1}$ as $k \rightarrow \infty$. $\hat{x}$ is the unique solution of (4.5) in $D_{\delta}^{1}$, and

$$
\begin{equation*}
\left\|\hat{x}-x^{(k)}\right\|_{w} \leqq \kappa^{k} \lambda \quad(k=0,1, \ldots) \tag{4.34}
\end{equation*}
$$

Proof. For any $x, y \in D_{\delta}^{1}$ let $h=y-x$. Then by the mean value theorem

$$
\begin{equation*}
T y_{0}-T x_{0}=\int_{0}^{1} T_{1}\left(x_{0}+\theta h_{0}\right) h_{0} d \theta \tag{4.35}
\end{equation*}
$$

$$
\begin{align*}
T_{1}\left(y_{0}\right) y_{1}-T_{1}\left(x_{0}\right) x_{1} & =T_{1}\left(y_{0}\right) h_{1}+\int_{0}^{1} X_{2}\left(x_{0}+\theta h_{0}\right)\left[h_{0}, x_{1}\right] d \theta  \tag{4.36}\\
& =T_{1}\left(y_{0}\right) h_{1}+\int_{0}^{1} T_{2}(x(\theta)) h_{0} d \theta+Y h_{0}
\end{align*}
$$

where $x(\theta)=\left(x_{0}+\theta h_{0}, x_{1}\right)$. Since $x(\theta) \in D_{\delta}^{1}(0 \leqq \theta \leqq 1)$, we have by (4.30) and (4.32)

$$
\begin{align*}
\left\|T y_{0}-T x_{0}\right\|_{c} \leqq \mu_{1}\left\|y_{0}-x_{0}\right\|_{c} & \leqq p \mu_{1}\|y-x\|_{w}  \tag{4.37}\\
\left\|T_{1}\left(y_{0}\right) y_{1}-T_{1}\left(x_{0}\right) x_{1}-Y h_{0}\right\|_{c} & \leqq \mu_{1}\left\|y_{1}-x_{1}\right\|_{c}+\mu_{4}\left\|y_{0}-x_{0}\right\|_{c}  \tag{4.38}\\
& \leqq\left(q \mu_{1}+p \mu_{4}\right)\|y-x\|_{w}
\end{align*}
$$

and also by (4.31)

$$
\begin{align*}
\|l[y-x]-f[y]+f[x]\| & =\left\|\int_{0}^{1}\left\{l-f^{\prime}(x+\theta h)\right\} h d \theta\right\|  \tag{4.39}\\
& \leqq \mu_{2}\|y-x\|_{w}
\end{align*}
$$

Let $u=K y-K x$. Then by (4.28) and (4.26)

$$
\begin{aligned}
u_{i}= & H_{i}\left(T y_{0}-T x_{0}\right)+S_{i}(l[y-x]-f[y]+f[x]) \\
& -S_{i+2} E\left\{T_{1}\left(y_{0}\right) y_{1}-T_{1}\left(x_{0}\right) x_{1}-Y y_{0}+Y x_{0}\right\} \quad(i=0,1),
\end{aligned}
$$

so that by (4.37)-(4.39) and (4.29)

$$
\begin{aligned}
\left\|u_{i}\right\|_{c} & \leqq\left\{p\left\|H_{i}\right\|_{c} \mu_{1}+\left\|S_{i}\right\|_{c} \mu_{2}+\left\|S_{i+2} E\right\|_{c}\left(q \mu_{1}+p \mu_{4}\right)\right\}\|y-x\|_{w} \\
& \leqq \kappa_{i}\|y-x\|_{w} \quad(i=0,1) .
\end{aligned}
$$

Hence by (iii) we have

$$
\begin{aligned}
\|K y-K x\|_{w} & =\max \left(p^{-1}\left\|u_{0}\right\|_{c}, q^{-1}\left\|u_{1}\right\|_{c}\right) \\
& \leqq \max \left(p^{-1} \kappa_{0}, q^{-1} \kappa_{1}\right)\|y-x\|_{w} \leqq \kappa\|y-x\|_{w} .
\end{aligned}
$$

The proof is completed by the same argument as in the proof of Theorem 2.

### 4.3. Approximate fundamental matrices

In this subsection error bounds of $x^{(0)}$ are given in terms of the approximate matrices $\tilde{\Phi}$ and $\tilde{\Phi}_{I}$.

### 4.3.1. Case 1

Let $R_{6} \in L(W[J], M[J])$ and $R_{7}: D^{1} \rightarrow M[J]$ be defined by

$$
\begin{array}{ll}
R_{6} h=R A h_{1}+R Y h_{0} & \text { for } h \in W[J], \\
R_{7} x=r_{2}+R X_{1}\left[x_{0}\right] x_{1} & \text { for } x \in D^{1}, \tag{4.41}
\end{array}
$$

where $r_{2}$ and $R$ are given by (3.6) and (3.7) respectively. Then we have the following

Lemma 7. $\tilde{L}_{I}$ exists and is invertible if

$$
\begin{gather*}
\operatorname{det} \tilde{G} \neq 0,  \tag{4.42}\\
\left\|\tilde{G}^{-1}\right\|\left\{\beta_{1}\left\|l_{2}\right\|+\rho \beta_{2}\left\|l_{1}\right\|\|Y\|_{c}\left(\beta_{1}+\|\tilde{\Phi}\|_{c}\right)\right\}<1,  \tag{4.43}\\
\max \left(p^{-1} v_{0}, q^{-1} v_{1}\right)<1, \tag{4.44}
\end{gather*}
$$

where $\beta_{1}, \beta_{2}, v_{0}$ and $v_{1}$ are constants such that

$$
\begin{gather*}
\beta=\exp \left(\rho\|A\|_{c}\right), \quad \beta_{1}=\|r\|_{c} \beta, \quad \beta_{2}=\left(\beta_{1}+\|\widetilde{\Phi}\|_{c}\left\|r_{1}\right\|_{c}\right) \beta  \tag{4.45}\\
p\left\|\tilde{S}_{i+4} R_{1}\right\|_{c}+\left\|\tilde{S}_{i+2} R_{6}\right\|_{c} \leqq v_{i} \quad(i=0,1) \tag{4.46}
\end{gather*}
$$

and $R_{1}$ is given by (3.8).
Proof. We show first that

$$
\begin{equation*}
\left\|\tilde{G}^{-1}\right\|\|\tilde{G}-G\|<1 \tag{4.47}
\end{equation*}
$$

Let $\varphi(t, s)=\tilde{\Phi}(t) \widetilde{\Phi}_{I}(s)-\Phi(t) \Phi_{I}(s) . \quad$ Then by (3.13)

$$
\begin{aligned}
\|\varphi(t, s)\| & \leqq\|\tilde{\Phi}(t)-\Phi(t)\|+\left\|\tilde{\Phi}(t) r_{1}(s)\right\|+\left\|\int_{t_{0}}^{s} \varphi(t, \tau) A(\tau) d \tau\right\| \\
& \leqq \beta_{1}+\|\tilde{\Phi}\|_{c}\left\|r_{1}\right\|_{c}+\left|\int_{t_{0}}^{s}\|A\|_{c}\|\varphi(t, \tau)\| d \tau\right|
\end{aligned}
$$

because

$$
\begin{gathered}
\Phi(t)\left\{\Phi_{I}(s)-I+\int_{t_{0}}^{s} \Phi_{I}(\tau) A(\tau) d \tau\right\}=0 \\
\tilde{\Phi}(t)\left\{\tilde{\Phi}_{I}(s)-I+\int_{t_{0}}^{s} \tilde{\Phi}_{I}(\tau) A(\tau) d \tau\right\}=\tilde{\Phi}(t) r_{1}(s)
\end{gathered}
$$

Gronwall's inequality yields

$$
\|\varphi(t, s)\| \leqq\left(\beta_{1}+\|\tilde{\Phi}\|_{c}\left\|r_{1}\right\|_{c}\right) \beta=\beta_{2} .
$$

Since

$$
(\tilde{E}-E) h=\int_{t_{0}}^{t} \varphi(t, s) h(s) d s \quad \text { for } \quad h \in C[J],
$$

we have

$$
\begin{equation*}
\|\tilde{E}-E\|_{c} \leqq \rho \beta_{2} \tag{4.48}
\end{equation*}
$$

By (4.15)

$$
\begin{aligned}
\tilde{G}-G & =l_{0}[\tilde{\Phi}-\Phi]+l_{1}[\tilde{E} Y \tilde{\Phi}-E Y \Phi] \\
& =l_{2}[\tilde{\Phi}-\Phi]+l_{1}[(\tilde{E}-E) Y \Phi],
\end{aligned}
$$

and so by (3.13) and (4.48)

$$
\|\widetilde{G}-G\| \leqq\left\|\tilde{l}_{2}\right\| \beta_{1}+\left\|l_{1}\right\| \rho \beta_{2}\|Y\|_{c}\left(\beta_{1}+\|\widetilde{\Phi}\|_{c}\right)
$$

Hence by (4.43) we have (4.47), which implies $\operatorname{det} G \neq 0$, and $L$ is invertible by Lemma 6.

We show next that

$$
\begin{equation*}
\left\|I-\tilde{L}_{I} L\right\|_{w}<1 \tag{4.49}
\end{equation*}
$$

By (3.19) and (4.40) we have

$$
\begin{equation*}
\widetilde{E}_{1} P_{1} h=h_{1}-\tilde{E} Y h_{0}-R_{6} h \quad \text { for } \quad h \in W[J] . \tag{4.50}
\end{equation*}
$$

Since $\tilde{S}_{i+4} \tilde{\Phi}=0(i=0,1)$ and

$$
\tilde{S}_{i+4} h_{0}-\tilde{S}_{i+2}\left(h_{1}-\tilde{E} Y h_{0}\right)=h_{i}-\tilde{S}_{i} l[h] \quad(i=0,1)
$$

by (4.18), (3.20) and (4.50)

$$
\left(I-\tilde{L}_{I} L\right) h=u
$$

where

$$
u_{i}=\tilde{S}_{i+4} R_{1} h_{0}-\tilde{S}_{i+2} R_{6} h \quad(i=0,1)
$$

By (4.46) we have

$$
\left\|u_{i}\right\|_{c} \leqq\left\{p\left\|\tilde{S}_{i+4} R_{1}\right\|_{c}+\left\|\tilde{S}_{i+2} R_{6}\right\|_{c}\right\}\|h\|_{w} \leqq v_{i}\|h\|_{w} \quad(i=0,1)
$$

and it follows that

$$
\begin{aligned}
\left\|\left(I-\tilde{L}_{I} L\right) h\right\|_{w} & =\max \left(p^{-1}\left\|u_{0}\right\|_{c}, q^{-1}\left\|u_{1}\right\|_{c}\right) \\
& \leqq \max \left(p^{-1} v_{0}, q^{-1} v_{1}\right)\|h\|_{w}
\end{aligned}
$$

Hence (4.49) is valid by (4.44), and $\tilde{L}_{I}$ is invertible by Lemma 1 . This completes the proof.

Let $\alpha_{3}$ and $\alpha_{4}$ be constants such that

$$
\begin{equation*}
\left\|r_{2}\right\|_{c}+\alpha_{0} \leqq \alpha_{3}, \quad q \alpha_{0}+p \alpha_{1}\|Y\|_{c} \leqq \alpha_{4} \tag{4.51}
\end{equation*}
$$

where $\alpha_{0}$ and $\alpha_{1}$ are given by (3.33) and (3.34) respectively. Then by (3.8) and (4.40)

$$
\left\|R_{1}\right\|_{c} \leqq \alpha_{3}, \quad\left\|R_{6}\right\|_{c} \leqq \alpha_{4} .
$$

Hence (4.46) can be replaced by

$$
\begin{equation*}
p\left\|\tilde{S}_{i+4}\right\|_{c} \alpha_{3}+\left\|\tilde{S}_{i+2}\right\|_{c} \alpha_{4} \leqq v_{i} \quad(i=0,1) \tag{4.52}
\end{equation*}
$$

Lemma 8. If $\operatorname{det} \boldsymbol{G} \neq 0$, then

$$
\begin{equation*}
\tilde{K} x=\tilde{K}_{1} x+\tilde{K}_{2} x \quad \text { for } \quad x \in D^{1} \tag{4.53}
\end{equation*}
$$

where

$$
\begin{gather*}
\tilde{K}_{2} x=u  \tag{4.54}\\
u_{i}=\tilde{S}_{i+4} R_{2} x_{0}-\tilde{S}_{i+2} R_{7} x \quad(i=0,1) \tag{4.55}
\end{gather*}
$$

and $R_{2}$ is the operator given by (3.9).
Proof. By (4.25), (4.18) and (4.3) we have $\tilde{K} x=y$, where

$$
\begin{equation*}
y_{i}=x_{i}-\tilde{S}_{i+4} \tilde{E}_{1} Q x_{0}+\tilde{S}_{i+2} \tilde{E}_{1} Q_{1} x-\tilde{S}_{i} f[x] \quad(i=0,1) \tag{4.56}
\end{equation*}
$$

By (3.19) and (4.41)

$$
\begin{equation*}
\tilde{E}_{1} Q_{1} x=x_{1}-\tilde{E} T_{1}\left(x_{0}\right) x_{1}-\tilde{\Phi}-R_{7} x . \tag{4.57}
\end{equation*}
$$

Substitution of (3.25) and (4.57) into (4.56) yields

$$
\begin{align*}
y_{i}= & \widetilde{H}_{i} T x_{0}-\tilde{S}_{i+2} \tilde{E}\left\{T_{1}\left(x_{0}\right) x_{1}-Y x_{0}\right\}+\tilde{S}_{i}(l[x]-f[x])  \tag{4.58}\\
& -\tilde{S}_{i+2} \tilde{\Phi}+\tilde{S}_{i+4} R_{2} x_{0}-\tilde{S}_{i+2} R_{7} x \quad(i=0,1),
\end{align*}
$$

because $\tilde{S}_{i+4} \tilde{\Phi}=0(i=0,1)$ and

$$
\begin{equation*}
x_{i}-\tilde{S}_{i+4} x_{0}+\tilde{S}_{i+2} x_{1}=\tilde{S}_{i} l[x]+\tilde{S}_{i+2} \tilde{E} Y x_{0} \quad(i=0,1) \tag{4.59}
\end{equation*}
$$

Hence (4.53) follows from (4.58) by (4.26) and (4.54).
Now we prove the following
Thborem 6. Let $x^{(0)} \in D^{1}$ be an approximate solution of (4.5) and suppose there exist an operator $\tilde{L}_{I}$, a positive number $\delta$ and nonnegative constants $\eta, \kappa$, $\kappa_{j}(j=0,1,2,3)$ such that
(i) $\tilde{L}_{I}$ is invertible;
(ii) $D_{\delta}^{1}=\left\{x \in W[J] \mid\left\|x-x^{(0)}\right\|_{w} \leqq \delta\right\} \subset D^{1}$;
(iii) $\kappa=\max \left(p^{-1}\left(\kappa_{0}+\kappa_{2}\right), q^{-1}\left(\kappa_{1}+\kappa_{3}\right)\right)<1$,
(4.60) $\quad p\left\|\tilde{H}_{i}\right\|_{c} \mu_{1}+\left\|\tilde{S}_{i}\right\|_{c} \mu_{2}+\left\|\tilde{S}_{i+2} \tilde{E}\right\|_{c}\left(q \mu_{1}+p \mu_{4}\right) \leqq \kappa_{i} \quad(i=0,1)$,

$$
\begin{align*}
p\left\|\tilde{S}_{i+4} R\right\|_{c} \mu_{3}+\left\|\tilde{S}_{i+2} R\right\|_{c}\left(q \mu_{3}+p \mu_{5}\right)+p\left\|\tilde{S}_{i+4} r_{2}\right\|_{c} \leqq & \kappa_{i+2}  \tag{4.61}\\
& (i=0,1)
\end{align*}
$$

where $\mu_{j}(j=1,2,3,4,5)$ are constants such that

$$
\begin{array}{ll}
\left\|T_{1}\left(x_{0}\right)\right\|_{c} \leqq \mu_{1} & \text { for all } \quad x \in D_{\delta}^{1} \\
\left\|f^{\prime}(x)-l\right\| \leqq \mu_{2} & \text { for all } \quad x \in D_{\frac{1}{\delta}}^{1} \\
\left\|X_{1}\left[x_{0}\right]\right\|_{c} \leqq \mu_{3} & \text { for all } \quad x \in D_{\delta}^{1} \\
\left\|T_{2}(x)\right\|_{c} \leqq \mu_{4} & \text { for all } \quad x \in D_{\delta}^{1} \\
\left\|X_{2}\left(x_{0}\right)\left[\cdot, x_{1}\right]\right\|_{c} \leqq \mu_{5} \quad \text { for all } \quad x \in D_{\delta}^{1} \tag{4.66}
\end{array}
$$

(iv) $\left\|\tilde{L}_{I} F x^{(0)}\right\|_{w} \leqq \eta ;$
(v) $\lambda=\eta /(1-\kappa) \leqq \delta$.

Then the conclusion of Theorem 5 is valid with $K$ replaced by $\tilde{K}$.

Proof. For any $x, y \in D_{\delta}^{1}$ let

$$
h=y-x, \quad u=\tilde{K}_{1} y-\tilde{K}_{1} x, \quad v=\tilde{K}_{2} y-\tilde{K}_{2} x .
$$

Then by (4.26), (4.37), (4.38), (4.39) and (4.60)

$$
\begin{equation*}
\left\|u_{i}\right\|_{c} \leqq \kappa_{i}\|y-x\|_{w} \quad(i=0,1) \tag{4.67}
\end{equation*}
$$

By (4.64), (4.66) and the mean value theorem we have

$$
\begin{align*}
& \left\|X_{1}\left[y_{0}\right] y_{1}-X_{1}\left[x_{0}\right] x_{1}\right\|_{c}  \tag{4.68}\\
& \quad=\left\|X_{1}\left[y_{0}\right] h_{1}+\int_{0}^{1} X_{2}\left(x_{0}+\theta h_{0}\right)\left[h_{0}, x_{1}\right] d \theta\right\|_{c} \\
& \leqq \mu_{3}\left\|h_{1}\right\|_{c}+\mu_{5}\left\|h_{0}\right\|_{c} \leqq\left(q \mu_{3}+p \mu_{5}\right)\|y-x\|_{w}
\end{align*}
$$

which yields by (4.41)

$$
\begin{equation*}
\left\|\tilde{S}_{i} R_{7} y-\tilde{S}_{i} R_{7} x\right\|_{c} \leqq\left\|\tilde{S}_{i} R\right\|_{c}\left(q \mu_{3}+p \mu_{5}\right)\|y-x\|_{w}, \quad(i=2,3) . \tag{4.69}
\end{equation*}
$$

Similarly by (3.32) and (4.64)
(4.70) $\quad\left\|\widetilde{S}_{j} R_{2} y_{0}-\tilde{S}_{j} R_{2} x_{0}\right\|_{c} \leqq\left\{\left\|\tilde{S}_{j} R\right\|_{c} \mu_{3}+\left\|\tilde{S}_{j} r_{2}\right\|_{c}\right\}\left\|y_{0}-x_{0}\right\|_{c}, \quad(j=4,5)$.

By (4.54), (4.69), (4.70) and (4.61) we have

$$
\begin{align*}
\left\|v_{i}\right\|_{c} & \leqq\left\{p\left\|\tilde{S}_{i+4} R\right\|_{c} \mu_{3}+\left\|\tilde{S}_{i+2} R\right\|_{c}\left(q \mu_{3}+p \mu_{5}\right)+p\left\|\tilde{S}_{i+4} r_{2}\right\|_{c}\right\}\|y-x\|_{w}  \tag{4.71}\\
& \leqq \kappa_{i+2}\|y-x\|_{w} \quad(i=0,1)
\end{align*}
$$

Let $z=\tilde{K} y-\tilde{K} x$. Then by (4.53), (4.67) and (4.71)

$$
\left\|z_{i}\right\|_{c}=\left\|u_{i}+v_{i}\right\|_{c} \leqq\left(\kappa_{i}+\kappa_{i+2}\right)\|y-x\|_{w} \quad(i=0,1)
$$

so that by (iii)

$$
\begin{aligned}
\|\tilde{K} y-\tilde{K} x\|_{w} & =\max \left(p^{-1}\left\|z_{0}\right\|_{c}, q^{-1}\left\|z_{1}\right\|_{c}\right) \\
& \leqq \max \left(p^{-1}\left(\kappa_{0}+\kappa_{2}\right), q^{-1}\left(\kappa_{1}+\kappa_{3}\right)\right)\|y-x\|_{w} \leqq \kappa\|y-x\|_{w} .
\end{aligned}
$$

The proof is completed by the same argument as in the proof of Theorem 2.

### 4.3.2. Case 2

Let $P_{3}, R_{8} \in L(W[J], M[J])$ and $R_{9}: D^{1} \rightarrow C[J]$ be defined by

$$
\begin{align*}
& P_{3} h=h_{1}(t)-\int_{t_{0}}^{t} A_{1}(s) h_{1}(s) d s-\int_{t_{0}}^{t}\left[Y h_{0}\right](s) d s \quad \text { for } h \in W[J],  \tag{4.72}\\
& R_{8} h=R_{3}\left(h_{1}-P_{3} h\right)-\tilde{E}\left(A-A_{1}\right) h_{1} \quad \text { for } h \in W[J] \tag{4.73}
\end{align*}
$$

$$
\begin{equation*}
R_{9} x=R_{3}\left(x_{1}-Q_{1} x\right)+\tilde{\Phi}\left(\tilde{\Phi}_{I}\left(t_{0}\right)-I\right) \quad \text { for } \quad x \in D^{1} \tag{4.74}
\end{equation*}
$$

where the matrix $A_{1}$ is given by (3.37) and the operator $R_{3}$ is given by (3.40). Then we have the following

## Lemma 9. Let

$$
\begin{equation*}
\operatorname{det} \tilde{G} \neq 0 \tag{4.75}
\end{equation*}
$$

Then $\tilde{L}_{I}$ is invertible if one of the following two conditions is satisfied:

$$
\begin{align*}
& v=\rho\left\{\left\|A_{1}-\gamma A\right\|_{c}+\left\|\gamma_{1} Y\right\|_{c} \sigma\right\}<1,  \tag{4.76}\\
& \max \left(p^{-1} v_{0}, q^{-1} v_{1}\right)<1, \tag{4.77}
\end{align*}
$$

where $\sigma, v_{0}$ and $v_{1}$ are constants such that

$$
\begin{gather*}
\left\|\tilde{S}_{4} \tilde{E}_{1}\right\|_{c}+\left\|\tilde{S}_{2} \tilde{E}_{1}\right\|_{c}+\left\|\tilde{S}_{0}\right\|_{c} \leqq \sigma  \tag{4.78}\\
p\left\|\tilde{S}_{i+4} R_{4}\right\|_{c}+\left\|\tilde{S}_{t+2} R_{8}\right\|_{c} \leqq v_{i} \quad(i=0,1) \tag{4.79}
\end{gather*}
$$

and $R_{4}$ is the operator given by (3.41).
Proof. Let $L_{1}$ be the operator defined by

$$
\begin{equation*}
L_{1} h=\left(P_{2} h_{0}, P_{3} h, l[h]\right) \quad \text { for } \quad h \in W[J] \tag{4.80}
\end{equation*}
$$

where $P_{2}$ is given by (3.39). Then it can be shown that $L_{1}$ is invertible by the same argument as in the proof of Lemma 6.

Suppose (4.76) holds. For any $\varphi=\left(u_{0}, u_{1}, e\right) \in B_{0}$ let $h=\tilde{L}_{I} \varphi$. Then by (4.18).

$$
\begin{equation*}
h_{i}=\tilde{S}_{i+4} \tilde{E}_{1} u_{0}-\tilde{S}_{i+2} \widetilde{E}_{1} u_{1}+\tilde{S}_{i} e \quad(i=01), \tag{4.81}
\end{equation*}
$$

and in the same manner as for (3.50) we have

$$
\begin{equation*}
\left(I-L_{1} \tilde{L}_{I}\right) \varphi=\left(v_{0}, v_{1}, 0\right) \tag{4.82}
\end{equation*}
$$

where

$$
\begin{gather*}
v_{0}(t)=\int_{t_{0}}^{t}\left\{A_{1}(s)-\gamma(s) A(s)\right\} u_{0}(s) d s  \tag{4.83}\\
v_{1}(t)=\int_{t_{0}}^{t}\left\{A_{1}(s)-\gamma(s) A(s)\right\} u_{1}(s) d s+\int_{t_{0}}^{t} \gamma_{1}(s)\left[Y h_{0}\right](s) d s \tag{4.84}
\end{gather*}
$$

By (4.81), (4.78)

$$
\begin{equation*}
\left\|h_{0}\right\|_{c} \leqq\left(\left\|\tilde{S}_{4} \tilde{E}_{1}\right\|_{c}+\left\|\tilde{S}_{2} \tilde{E}_{1}\right\|_{c}+\left\|\tilde{S}_{0}\right\|_{c}\right)\|\varphi\|_{b} \leqq \sigma\|\varphi\|_{b} \tag{4.85}
\end{equation*}
$$

and by (4.83), (4.84), (4.85) and (4.76) we have

$$
\begin{gathered}
\left\|v_{0}\right\|_{c} \leqq \rho\left\|A_{1}-\gamma A\right\|_{c}\left\|u_{0}\right\|_{c} \leqq v\|\varphi\|_{b} \\
\left\|v_{1}\right\|_{c} \leqq \rho\left\|A_{1}-\gamma A\right\|_{c}\left\|u_{1}\right\|_{c}+\rho\left\|\gamma_{1} Y\right\|_{c}\left\|h_{0}\right\|_{c} \leqq v\|\varphi\|_{b}
\end{gathered}
$$

so that by (4.82)

$$
\left\|\left(I-L_{1} \tilde{L}_{I}\right) \varphi\right\|_{b}=\max \left(\left\|v_{0}\right\|_{c},\left\|v_{1}\right\|_{c}\right) \leqq v\|\varphi\|_{b} .
$$

Hence $\tilde{L}_{I}$ is invertible by (4.76) and Lemma 1.
We treat next the case where (4.77) is valid. By (3.51) we have

$$
\begin{align*}
\tilde{E}_{1} P_{2} v_{0} & =v_{0}-\tilde{\Phi} \tilde{\Phi}_{I}\left(t_{0}\right) v_{0}\left(t_{0}\right)-R_{4} v_{0}  \tag{4.86}\\
\tilde{E}_{1} P_{3} v & =v_{1}-\tilde{E} Y v_{0}-R_{8} v \quad \text { for } \quad v \in W[J] . \tag{4.87}
\end{align*}
$$

Substituting $u_{0}=P_{2} v_{0}, u_{1}=P_{3} v$ and $e=l[v]$ into (4.81) and making use of (4.86) and (4.87), we obtain

$$
\left(I-\tilde{L}_{I} L_{1}\right) v=\left(w_{0}, w_{1}\right)
$$

where

$$
w_{i}=\tilde{S}_{i+4} R_{4} v_{0}-\tilde{S}_{i+2} R_{8} v \quad(i=0,1)
$$

Since by (4.79)

$$
\left\|\left(I-\tilde{L}_{I} L_{1}\right) v\right\|_{w}=\max \left(p^{-1}\left\|w_{0}\right\|_{c}, q^{-1}\left\|w_{1}\right\|_{c}\right) \leqq \max \left(p^{-1} v_{0}, q^{-1} v_{1}\right)\|v\|_{w}
$$

$\tilde{L}_{I}$ is invertible by (4.77) and Lemma 1.
Lemma 10. If $\operatorname{det} \tilde{G} \neq 0$, then the conclusion of Lemma 8 is valid with (4.55) replaced by

$$
\begin{equation*}
u_{i}=\tilde{S}_{i+4} R_{5} x_{0}-\tilde{S}_{i+2} R_{9} x \quad(i=0,1) \tag{4.88}
\end{equation*}
$$

where $R_{5}$ is the operator given by (3.42).
Proof. By (3.51) we have

$$
\begin{equation*}
\widetilde{E}_{1} Q_{1} x=x_{1}-\tilde{E} T_{1}\left(x_{0}\right) x_{1}-\tilde{\Phi}-R_{9} x \quad \text { for } \quad x \in D^{1} \tag{4.89}
\end{equation*}
$$

Substitution of (3.55) and (4.89) into (4.56) completes the proof by the same argument as in the proof of Lemma 8.

Theorem 7. Suppose the assumptions of Theorem 6 are satisfied with (4.61) replaced by

$$
\begin{equation*}
p\left\|\tilde{S}_{i+4} R_{3}\right\|_{c}\left(1+\rho \mu_{3}\right)+\left\|\tilde{S}_{i+2} R_{3}\right\|_{c} \rho\left(q \mu_{3}+p \mu_{5}\right) \leqq \kappa_{i+2} \quad(i=0,1) \tag{4.90}
\end{equation*}
$$

Then the conclusion of Theorem 6 is valid.
Proof. For any $x, y \in D_{\delta}^{1}$ we have by (3.57)

$$
\begin{equation*}
\left\|\tilde{S}_{i} R_{5} y_{0}-\tilde{S}_{i} R_{5} x_{0}\right\|_{c} \leqq\left\|\tilde{S}_{i} R_{3}\right\|_{c}\left(1+\rho \mu_{3}\right)\left\|y_{0}-x_{0}\right\|_{c} \quad(i=4,5) \tag{4.91}
\end{equation*}
$$

and by (4.74) and (4.68)

$$
\begin{equation*}
\left\|\tilde{S}_{j} R_{9} y-\widetilde{S}_{j} R_{9} x\right\|_{c} \leqq\left\|\widetilde{S}_{j} R_{3}\right\|_{c} \rho\left(q \mu_{3}+p \mu_{5}\right)\|y-x\|_{w} \quad(j=2,3) \tag{4.92}
\end{equation*}
$$

Let $v=\tilde{K}_{2} y-\tilde{K}_{2} x$. Then by (4.91), (4.92) and (4.90) it follows that

$$
\begin{align*}
\left\|v_{i}\right\|_{c} & \leqq\left\{p\left\|\tilde{S}_{i+4} R_{3}\right\|_{c}\left(1+\rho \mu_{3}\right)+\left\|\tilde{S}_{i+2} R_{3}\right\|_{c} \rho\left(q \mu_{3}+p \mu_{5}\right)\right\}\|y-x\|_{w}  \tag{4.93}\\
& \leqq \kappa_{i+2}\|y-x\|_{w} \quad(i=0,1)
\end{align*}
$$

The proof is completed by the same argument as in the proof of Theorem 6.
Let $\sigma_{0}, \sigma_{1}$ and $\sigma_{2}$ be constants such that

$$
\left\|\gamma_{1}\right\|_{c} \leqq \sigma_{0}, \quad\left\|A-A_{1}\right\|_{c} \leqq \sigma_{1}, \quad\left\|A-A_{2}\right\|_{c} \leqq \sigma_{2}
$$

and let $\alpha_{j}(j=0,1,2,3)$ be constants satisfying

$$
\begin{array}{ll}
\left\|\tilde{S}_{i+4} R_{3}\right\|_{c} \leqq\left\|\tilde{H}_{i}\right\|_{c} \sigma_{2}+\left\|\tilde{S}_{i+4}\right\|_{c} \sigma_{0} \leqq \alpha_{i} & (i=0,1) \\
\left\|\tilde{S}_{j} R_{3}\right\|_{c} \leqq\left\|\tilde{S}_{j} \tilde{E}\right\|_{c} \sigma_{2}+\left\|\tilde{S}_{j}\right\|_{c} \sigma_{0} \leqq \alpha_{j} & (j=2,3)
\end{array}
$$

Then (4.79) and (4.90) can be replaced respectively by

$$
\begin{align*}
& p \alpha_{i}+\alpha_{i+4}\left\|A_{1}\right\|_{c}+p \alpha_{i+2} \rho\|Y\|_{c}+\sigma_{1}\left(p\left\|H_{i}\right\|_{c}+q\left\|S_{i+2} E\right\|_{c}\right) \leqq v_{i}  \tag{4.94}\\
& \\
& (i=0,1),  \tag{4.95}\\
& p \alpha_{i}+\alpha_{i+4} \mu_{3}+p \alpha_{i+2} \rho \mu_{5} \leqq \kappa_{i+2} \quad(i=0,1),
\end{align*}
$$

where

$$
\alpha_{i+4}=\rho\left(p \alpha_{i}+q \alpha_{i+2}\right) \quad(i=0,1) .
$$

Hence by (3.58)-(3.61) we can estimate the left sides of (4.76) and (4.90) without computing $\tilde{\Phi}^{-1}$ and $\tilde{\Phi}_{I}^{-1}$.

### 4.3.3. Treatment in the original form

In this subsection we treat the boundary value problem (2.4), (4.2) directly without replacing (2.4) and (4.1) by systems of integral equations.

Let $C^{1}[J]$ be the space of all real $n$-vector functions continuously differentiable on $J$ with the norm $\|\cdot\|_{c}$ and denote by $M^{1}[J]$ the space of all real $n \times n$ matrix functions continuously differentiable on $J$. Let $W^{1}[J]=C^{1}[J] \times M^{1}[J]$
be the space with the norm $\|\cdot\|_{w}$ and put $D^{2}=D^{1} \cap W^{1}[J]$. Let $B=C[J] \times$ $M[J] \times R^{n} \times M^{n}$ be a Banach space with the norm
$\|\varphi\|_{b}=\max \left(\left\|u_{0}\right\|_{c},\left\|u_{1}\right\|_{c},\left\|e_{0}\right\|,\left\|e_{1}\right\|\right) \quad$ for $\quad \varphi=\left(u_{0}, u_{1}, e_{0}, e_{1}\right) \in B$,
where $M^{n}=L\left(R^{n}, R^{n}\right)$.
We consider the equation

$$
\begin{equation*}
\mathscr{F} x=0 \quad \text { for } \quad x \in D^{2} \tag{4.96}
\end{equation*}
$$

where the operator $\mathscr{F}: D^{2} \rightarrow B$ is defined by

$$
\begin{array}{r}
\mathscr{F} x=\left(\frac{d x_{0}}{d t}-X\left(x_{0}, t\right), \frac{d x_{1}}{d t}-X_{1}\left[x_{0}\right] x_{1}, f[x],\right.  \tag{4.97}\\
\left.x_{1}\left(t_{0}\right)-I\right) \\
\text { for } x \in D^{2} .
\end{array}
$$

Let $\mathscr{L}: W^{1}[J] \rightarrow B$ be the linear operator defined by

$$
\begin{equation*}
\mathscr{L} h=\left(\frac{d h_{0}}{d t}-A(t) h_{0}, \frac{d h_{1}}{d t}-A(t) h_{1}-Y h_{0}, l[h], h_{1}\left(t_{0}\right)\right) \tag{4.98}
\end{equation*}
$$

$$
\text { for } h \in W^{1}[J] .
$$

Then we have the following analogue of Lemma 6.
Lemma 11. $\mathscr{L}$ has an inverse operator $\mathscr{L}_{I}$ if and only if

$$
\begin{equation*}
\operatorname{det} G \neq 0 \tag{4.99}
\end{equation*}
$$

Suppose (4.99) is satisfied. Then for any $\varphi=\left(u_{0}, u_{1}, e_{0}, e_{1}\right) \in B$

$$
\begin{equation*}
\mathscr{L}_{I} \varphi=h \tag{4.100}
\end{equation*}
$$

where

$$
\begin{equation*}
h_{i}=H_{i} u_{0}-S_{i+2} E u_{1}+S_{i} e_{0}-S_{i+2} \Phi e_{1} \quad(i=0,1) . \tag{4.101}
\end{equation*}
$$

Proof. By (4.98) the equation $\mathscr{L} h=\varphi$ is equivalent to the system

$$
\begin{align*}
& \quad \frac{d h_{0}}{d t}-A(t) h_{0}=u_{0},  \tag{4.102}\\
& \quad \frac{d h_{1}}{d t}-A(t) h_{1}=u_{1}+Y h_{0},  \tag{4.103}\\
& l_{0}\left[h_{0}\right]+l_{1}\left[h_{1}\right]=e_{0},  \tag{4.104}\\
& h_{1}\left(t_{0}\right)=e_{1} . \tag{4.105}
\end{align*}
$$

The general solution of (4.102) is given by

$$
\begin{equation*}
h_{0}=\Phi c+E u_{0} \tag{4.106}
\end{equation*}
$$

with an arbitrary $c \in R^{n}$. The solution of the initial value problem (4.103), (4.105) is

$$
\begin{equation*}
h_{1}=\Phi e_{1}+E u_{1}+E Y h_{0} \tag{4.107}
\end{equation*}
$$

and substitution of (4.106) into (4.107) yields

$$
\begin{equation*}
h_{1}=\Phi e_{1}+E u_{1}+E Y E u_{0}+E Y \Phi c . \tag{4.108}
\end{equation*}
$$

By (4.15), (4.106) and (4.108) it follows from (4.104) that

$$
\begin{equation*}
l_{2}\left[E u_{0}\right]+l_{1}\left[E u_{1}\right]+l_{1}[\Phi] e_{1}+G c=e_{0} \tag{4.109}
\end{equation*}
$$

The proof is completed by the same argument as in the proof of Lemma 6.
Let $\mathscr{K}$ and $\mathscr{K}_{1}$ be the operators from $D^{2}$ into $W^{1}[J]$ defined by

$$
\begin{array}{ll}
\mathscr{K} x=\left(I-\mathscr{L}_{I} \mathscr{F}\right) x & \text { for } \\
x \in D^{2},  \tag{4.111}\\
\mathscr{K}_{1} x=\mathscr{L}_{I}(\mathscr{L}-\mathscr{F}) x & \text { for }
\end{array} \quad x \in D^{2} .
$$

Suppose $\tilde{\Phi}$ and $\tilde{\Phi}_{I}$ are continuously differentiable on $J$ and let the operator $\tilde{K}_{2}$ be defined by

$$
\begin{equation*}
\tilde{K}_{2} h=u \quad \text { for } \quad h \in W^{1}[J], \tag{4.112}
\end{equation*}
$$

where

$$
\begin{align*}
u_{i}= & \tilde{H}_{i}\left(A-A_{2}\right) h_{0}-\tilde{S}_{i+2} \tilde{E}\left(A-A_{2}\right) h_{1}+\tilde{S}_{i+4} \gamma_{1} h_{0}  \tag{4.113}\\
& -\tilde{S}_{i+2} \gamma_{1} h_{1}-\tilde{S}_{i+2} \tilde{\Phi}\left(\widetilde{\Phi}_{I}\left(t_{0}\right)-I\right) h_{1}\left(t_{0}\right) \quad(i=0,1)
\end{align*}
$$

Now we show the following
Lemma 12. $\tilde{\mathscr{L}}_{I}$ is invertible if

$$
\begin{equation*}
\operatorname{det} \tilde{G} \neq 0 \tag{4.114}
\end{equation*}
$$

$$
\begin{equation*}
v=\max \left(\left\|\gamma_{1}\right\|_{c}+\left\|\gamma_{1} Y\right\|_{c} \sigma,\left\|I-\tilde{\Phi}\left(t_{0}\right)\right\|\right)<1 \tag{4.115}
\end{equation*}
$$

where $\sigma$ is a constant such that

$$
\begin{equation*}
\left\|\tilde{H}_{0}\right\|_{c}+\left\|\tilde{S}_{2} \tilde{E}\right\|_{c}+\left\|\tilde{S}_{0}\right\|_{c}+\left\|\tilde{S}_{2} \tilde{\Phi}\right\|_{c} \leqq \sigma . \tag{4.116}
\end{equation*}
$$

Proof. Let $L_{1}$ be the operator defined by

$$
\begin{array}{r}
L_{1} h=\left(\frac{d h_{0}}{d t}-A_{1} h_{0}, \frac{d h_{1}}{d t}-A_{1} h_{1}-Y h_{0}, l[h], h_{1}\left(t_{0}\right)\right)  \tag{4.117}\\
\text { for } h \in W^{1}[J]
\end{array}
$$

where $A_{1}$ is the matrix given by (3.37). Then it can be shown that $L_{1}$ is invertible by the same argument as in the proof of Lemma 11.

For any $\varphi=\left(u_{0}, u_{1}, e_{0}, e_{1}\right) \in B$ let $h=\tilde{\mathscr{L}}_{I} \varphi$. Then by (4.100)

$$
\begin{align*}
h_{0} & =\tilde{E} u_{0}+\tilde{\Phi} \tilde{G}^{-1}\left(e_{0}-\tilde{l}_{2}\left[\tilde{E} u_{0}\right]-l_{1}\left[\tilde{E} u_{1}\right]-l_{1}[\tilde{\Phi}] e_{1}\right),  \tag{4.118}\\
h_{1} & =\tilde{E}\left(u_{1}+Y h_{0}\right)+\tilde{\Phi} e_{1} \tag{4.119}
\end{align*}
$$

and by (3.37)

$$
\begin{align*}
& \frac{d h_{0}}{d t}=A_{1} h_{0}+\gamma u_{0}  \tag{4.120}\\
& \frac{d h_{1}}{d t}=A_{1} h_{1}+\gamma\left(u_{1}+Y h_{0}\right) \tag{4.121}
\end{align*}
$$

Since $\tilde{G}=\tilde{l}_{2}[\tilde{\Phi}]$, by (4.13) and (4.14) we have

$$
\begin{align*}
l[h]= & \tilde{l}_{2}\left[h_{0}\right]+l_{1}\left[\tilde{E} u_{1}\right]+l_{1}[\tilde{\Phi}] e_{1}  \tag{4.122}\\
= & \eta_{2}\left[\widetilde{E} u_{0}\right]+\tilde{l}_{2}[\tilde{\Phi}] \tilde{G}^{-1}\left\{e_{0}-\tilde{l}_{2}\left[\tilde{E} u_{0}\right]-l_{1}\left[\tilde{E} u_{1}\right]-l_{1}[\tilde{\Phi}] e_{1}\right\} \\
& +l_{1}\left[\widetilde{E} u_{1}\right]+l_{1}[\tilde{\Phi}] e_{1}=e_{0} .
\end{align*}
$$

From (4.119) it follows that

$$
\begin{equation*}
h_{1}\left(t_{0}\right)=\widetilde{\Phi}\left(t_{0}\right) e_{1} . \tag{4.123}
\end{equation*}
$$

By (4.120)-(4.123)

$$
\begin{equation*}
\left(I-L_{1} \tilde{\mathscr{L}}_{I}\right) \varphi=\left(\gamma_{1} u_{0}, \gamma_{1}\left(u_{1}+Y h_{0}\right), 0,\left(I-\tilde{\Phi}\left(t_{0}\right)\right) e_{1}\right) \tag{4.124}
\end{equation*}
$$

By (4.100) and (4.116) we have

$$
\left\|h_{0}\right\|_{c} \leqq\left(\left\|\tilde{H}_{0}\right\|_{c}+\left\|\tilde{S}_{2} \tilde{E}\right\|_{c}+\left\|\tilde{S}_{0}\right\|_{c}+\left\|\tilde{S}_{2} \tilde{\Phi}\right\|_{c}\right)\|\varphi\|_{b} \leqq \sigma\|\varphi\|_{b}
$$

so that by (4.124) and (4.115)

$$
\begin{aligned}
\left\|\left(I-L_{1} \check{\mathscr{L}}_{I}\right) \varphi\right\|_{b} & =\max \left(\left\|\gamma_{1} u_{0}\right\|_{c},\left\|\gamma_{1}\left(u_{1}+Y h_{0}\right)\right\|_{c},\left\|\left(I-\tilde{\Phi}\left(t_{0}\right)\right) e_{1}\right\|\right) \\
& \leqq \max \left(\left\|\gamma_{1}\right\|_{c}+\left\|\gamma_{1} Y\right\|_{c} \sigma,\left\|I-\tilde{\Phi}\left(t_{0}\right)\right\|\right)\|\varphi\|_{b} \leqq v\|\varphi\|_{b} .
\end{aligned}
$$

Hence $\tilde{\mathscr{L}}_{I}$ is invertible by (4.115) and Lemma 1.
We have the following

Thborem 8. Let $x^{(0)} \in D^{2}$ be an approximate solution of (4.96) and suppose there exist an operator $\check{\mathscr{L}}_{I}$, a positive number $\delta$ and nonnegative constants $\eta, \kappa, \kappa_{j}(j=0,1,2,3)$ such that
(i) $\tilde{\mathscr{L}}_{I}$ is invertible;
(ii) $D_{\delta}^{2}=\left\{x \in W^{1}[J] \quad \mid \quad\left\|x-x^{(0)}\right\|_{w} \leqq \delta\right\} \subset D^{2}$;
(iii) $\kappa=\max \left(p^{-1}\left(\kappa_{0}+\kappa_{2}\right), q^{-1}\left(\kappa_{1}+\kappa_{3}\right)\right)<1$,

$$
\begin{align*}
& p\left\|\tilde{H}_{i}\right\|_{c} \mu_{1}+\left\|\tilde{S}_{i}\right\|_{c} \mu_{2}+\left\|\tilde{S}_{i+2} \tilde{E}\right\|_{c}\left(q \mu_{1}+p \mu_{4}\right) \leqq \kappa_{i} \quad(i=0,1)  \tag{4.125}\\
& \left\|A-A_{2}\right\|_{c}\left(p\left\|\tilde{H}_{i}\right\|_{c}+q\left\|\tilde{S}_{i+2} \tilde{E}\right\|_{c}\right)+\left\|\gamma_{1}\right\|_{c}\left(p\left\|\tilde{S}_{i+4}\right\|_{c}+q\left\|\tilde{S}_{i+2}\right\|_{c}\right)  \tag{4.126}\\
& \quad+q\left\|\tilde{S}_{i+2} \tilde{\Phi}\right\|_{c}\left\|\tilde{S}_{I}\left(t_{0}\right)-I\right\| \leqq \kappa_{i+2} \quad(i=0,1)
\end{align*}
$$

where $\mu_{1}, \mu_{2}$ and $\mu_{4}$ are constants such that

$$
\begin{array}{lll}
\left\|T_{1}\left(x_{0}\right)\right\|_{c} \leqq \mu_{1} & \text { for all } & x \in D_{\delta}^{2} \\
\left\|f^{\prime}(x)-l\right\| \leqq \mu_{2} & \text { for all } & x \in D_{\delta}^{2} \\
\left\|T_{2}(x)\right\|_{c} \leqq \mu_{4} & \text { for all } & x \in D_{\delta}^{2} \tag{4.129}
\end{array}
$$

(iv) $\left\|\tilde{\mathscr{L}}_{1} \mathscr{F} x^{(0)}\right\|_{w} \leqq \eta$;
(v) $\lambda=\eta /(1-\kappa) \leqq \delta$.

Then the conclusion of Theorem 5 is valid with $K$ and $D_{\delta}^{1}$ replaced by $\widetilde{\mathscr{K}}$ and $D_{\delta}^{2}$ respectively.

Proof. For any $x \in D^{2}$ by (4.97) and (4.98) we have

$$
(\mathscr{L}-\mathscr{F}) x=\left(T x_{0}, T_{1}\left(x_{0}\right) x_{1}-Y x_{0}, l[x]-f[x], I\right)
$$

and by (4.111) and (4.100)

$$
\begin{equation*}
\tilde{\mathscr{K}}_{1} x=u, \tag{4.130}
\end{equation*}
$$

where

$$
\begin{align*}
u_{i}= & \tilde{H}_{1} T x_{0}-\tilde{S}_{i+2} \tilde{E}\left\{T_{1}\left(x_{0}\right) x_{1}-Y x_{0}\right\}+\tilde{S}_{i}(l[x]-f[x])  \tag{4.131}\\
& -\tilde{S}_{i+2} \tilde{\Phi} \quad(i=0,1) .
\end{align*}
$$

For any $h \in W^{1}[J]$ let $v=\tilde{\mathscr{L}}_{I} \mathscr{L} h$. Since $\tilde{\Phi}_{I}^{\prime}=-\tilde{\Phi}_{I} A_{2}$, by integration by parts we have

$$
\tilde{E}\left\{\frac{d h_{0}}{d t}-A(t) h_{0}\right\}=\tilde{E}\left(A_{2}-A\right) h_{0}+\gamma h_{0}-\tilde{\Phi} \widetilde{\Phi}_{I}\left(t_{0}\right) h_{0}\left(t_{0}\right)
$$

$$
\tilde{E}\left\{\frac{d h_{1}}{d t}-A(t) h_{1}-Y h_{0}\right\}=\tilde{E}\left(A_{2}-A\right) h_{1}-\tilde{E} Y h_{0}+\gamma h_{1}-\tilde{\Phi} \tilde{\Phi}_{I}\left(t_{0}\right) h_{1}\left(t_{0}\right)
$$

and by (4.100)
(4.132) $\quad v_{i}=\tilde{S}_{i+4}\left\{\tilde{E}\left(A_{2}-A\right) h_{0}+\gamma h_{0}-\tilde{\Phi} \tilde{\Phi}_{I}\left(t_{0}\right) h_{0}\left(t_{0}\right)\right\}-\tilde{S}_{i+2}\left\{\tilde{E}\left(A_{2}-A\right) h_{1}\right.$

$$
\begin{aligned}
&\left.-\tilde{E} Y h_{0}+\gamma h_{1}-\tilde{\Phi} \tilde{\Phi}_{I}\left(t_{0}\right) h_{1}\left(t_{0}\right)\right\}+\tilde{S}_{i} l[h]-\tilde{S}_{i+2} \tilde{\Phi} h_{1}\left(t_{0}\right) \\
&(i=0,1) .
\end{aligned}
$$

Since $\tilde{S}_{i+4} \tilde{\Phi}=0(i=0,1)$ and

$$
\begin{aligned}
\tilde{S}_{i+2} \tilde{E} Y h_{0}-\tilde{S}_{\imath+2} \gamma h_{1}+\tilde{S}_{i} l[h]=-\tilde{S}_{i+4} h_{0}+\tilde{S}_{i+2} \gamma_{1} h_{1}+ & h_{1} \\
& (i=0,1)
\end{aligned}
$$

by (4.132) we have

$$
\begin{equation*}
\left(I-\tilde{\mathscr{L}}_{I} \mathscr{L}\right) h=w \tag{4.133}
\end{equation*}
$$

where

$$
\begin{align*}
w_{i}= & \widetilde{H}_{i}\left(A-A_{2}\right) h_{0}-\tilde{S}_{i+2} \tilde{E}\left(A-A_{2}\right) h_{1}-\tilde{S}_{i+4} \gamma_{1} h_{0}-\tilde{S}_{i+2} \gamma_{1} h_{1}  \tag{4.134}\\
& -\tilde{S}_{i+2} \tilde{\Phi}\left(\tilde{\Phi}_{I}\left(t_{0}\right)-I\right) h_{1}\left(t_{0}\right) \quad(i=0,1) .
\end{align*}
$$

Hence by (4.110), (4.111), (4.112) and (4.133)

$$
\tilde{\mathscr{K}} x=\tilde{\mathscr{L}}_{I}(\mathscr{L}-\mathscr{F}) x+\left(I-\tilde{\mathscr{L}}_{1} \mathscr{L}\right) x=\tilde{\mathscr{K}}_{1} x+\tilde{K}_{2} x .
$$

For any $x, y \in D_{\delta}^{2}$ let $u=\widetilde{\mathscr{K}}_{1} y-\widetilde{\mathscr{K}}_{1} x$. Then by (4.130)

$$
\begin{aligned}
u_{i}= & \tilde{H}_{i}\left(T y_{0}-T x_{0}\right)+\tilde{S}_{i}(l[y-x]-f[y]+f[x]) \\
& -\widetilde{S}_{i+2} \tilde{E}\left\{T_{1}\left(y_{0}\right) y_{1}-T_{1}\left(x_{0}\right) x_{1}-Y y_{0}+Y x_{0}\right\} \quad(i=0,1)
\end{aligned}
$$

so that by (4.37)-(4.39) and (4.125)

$$
\begin{align*}
\left\|u_{i}\right\|_{c} & \leqq\left\{p\left\|\tilde{H}_{i}\right\|_{c} \mu_{1}+\left\|\tilde{S}_{i}\right\|_{c} \mu_{2}+\left\|\tilde{S}_{i+2} \tilde{E}\right\|_{c}\left(q \mu_{1}+p \mu_{4}\right)\right\}\|y-x\|_{w}  \tag{4.135}\\
& \leqq \kappa_{i}\|y-x\|_{w} \quad(i=0,1) .
\end{align*}
$$

Let $v=\tilde{\mathscr{K}}_{2} y-\tilde{\mathscr{K}}_{2} x$. Then by (4.133) and (4.126) we have

$$
\begin{align*}
\left\|v_{i}\right\|_{c} \leqq & \left\|\tilde{H}_{i}\right\|_{c}\left\|A-A_{2}\right\|_{c}\left\|y_{0}-x_{0}\right\|_{c}+\left\|\tilde{S}_{i+2} \tilde{E}\right\|_{c}\left\|A-A_{2}\right\|_{c}\left\|y_{1}-x_{1}\right\|_{c}  \tag{4.136}\\
& +\left\|\tilde{S}_{i+4}\right\|_{c}\left\|\gamma_{1}\right\|_{c}\left\|y_{0}-x_{0}\right\|_{c}+\left\|\tilde{S}_{i+2}\right\|_{c}\left\|\gamma_{1}\right\|_{c}\left\|y_{1}-x_{1}\right\|_{c} \\
& +\left\|\tilde{S}_{i+2} \tilde{\Phi}\right\|_{c}\left\|\tilde{\Phi}_{I}\left(t_{0}\right)-I\right\|\left\|y_{1}-x_{1}\right\|_{c} \\
\leqq & \kappa_{i+2}\|y-x\|_{w} \quad(i=0,1) .
\end{align*}
$$

Let $z=\tilde{\mathscr{K}} y-\tilde{\mathscr{K}} x . \quad$ Then by (4.135) and (4.136)

$$
\left\|z_{i}\right\|_{c}=\left\|u_{i}+v_{i}\right\|_{c} \leqq\left(\kappa_{i}+\kappa_{i+2}\right)\|y-x\|_{w} \quad(i=0,1)
$$

so that by (iii)

$$
\begin{aligned}
\|\tilde{\mathscr{K}} y-\tilde{\mathscr{K}} x\|_{w} & =\max \left(p^{-1}\left\|z_{0}\right\|_{c}, q^{-1}\left\|z_{1}\right\|_{c}\right) \\
& \leqq \max \left(p^{-1}\left(\kappa_{0}+\kappa_{2}\right), q^{-1}\left(\kappa_{1}+\kappa_{3}\right)\right)\|y-x\|_{w} \leqq \kappa\|y-x\|_{w} .
\end{aligned}
$$

The proof is completed by the same argument as in the proof of Theorem 5.

### 4.4. A numerical example

We consider the boundary value problem

$$
\begin{equation*}
\frac{d x}{d t}=X(x, t) \equiv\binom{x_{2}}{-x_{1}-\left(x_{1}-t\right)^{3}+t+0.1} \quad(-1 \leqq t \leqq 1) \tag{4.137}
\end{equation*}
$$

$$
\begin{equation*}
f[y] \equiv\left(g^{\prime}(x)[Z]\right)^{*} g[x]=0 \quad \text { for } \quad y=(x, Z) \in D^{1} \tag{4.138}
\end{equation*}
$$

where $a^{*}$ denotes the transpose of a matrix $a, Z(t)$ is the solution of the matrix equation

$$
\frac{d Z}{d t}=X_{1}[x] Z \equiv\left(\begin{array}{cc}
0 & 1  \tag{4.139}\\
-1-3\left(x_{1}-t\right)^{2} & 0
\end{array}\right) Z
$$

with $Z\left(t_{0}\right)=I$, and

$$
\begin{align*}
g[x] & =\left(\begin{array}{l}
g_{1}[x] \\
g_{2}[x] \\
g_{3}[x]
\end{array}\right) \equiv\left(\begin{array}{l}
x_{1}(-1)+0.9 \\
\alpha\left(x_{2}(0)^{2}-\beta\right) \\
x_{1}(1)-1.1
\end{array}\right),  \tag{4.140}\\
t_{0} & =-1, \quad \alpha=0.1, \quad \beta=1.1 \tag{4.141}
\end{align*}
$$

The condition (4.138) arises from the boundary value problem of the least squares type (4.137) and $(g[x])^{*} g[x]=\min$. [2].

We denote by $y^{(0)}=\left(x^{(0)}, Z^{(0)}\right)$ an approximate solution of this problem with

$$
\begin{equation*}
x_{1}^{(0)}(t)=t+0.1, \quad x_{2}^{(0)}(t)=1, \quad Z^{(0)}(t)=\Phi(t) \tag{4.142}
\end{equation*}
$$

where $\Phi(t)$ is the solution of the problem

$$
\frac{d \Phi}{d t}=A(t) \Phi, \quad \Phi(-1)=I
$$

$$
A(t) \equiv X_{1}\left[x^{(0)}\right](t)=\left(\begin{array}{cc}
0 & 1  \tag{4.143}\\
-\mu^{2} & 0
\end{array}\right), \quad \mu=\sqrt{1.03}
$$

With the notations

$$
\begin{equation*}
s(t)=\sin \mu(t+1), \quad c(t)=\cos \mu(t+1), \quad v=1 / \mu \tag{4.144}
\end{equation*}
$$

$\Phi(t)$ and $\Phi_{I}(t)$ can be written as follows:

$$
\Phi(t)=\left(\begin{array}{rr}
c(t) & v s(t)  \tag{4.145}\\
-\mu s(t) & c(t)
\end{array}\right), \quad \Phi_{I}(t)=\left(\begin{array}{rr}
c(t) & -v s(t) \\
\mu s(t) & c(t)
\end{array}\right)
$$

Let the operators $N_{i}: R^{2} \rightarrow R^{1}(i=0,1)$ and the matrices $C_{j}(j=1,2,3)$ be defined by

$$
\begin{align*}
& N_{i} h=h_{i} \quad(i=1,2) \quad \text { for } \quad h=\left(h_{1}, h_{2}\right)^{*} \in R^{2},  \tag{4.146}\\
& C_{1}=\left(\begin{array}{ll}
0 & 0 \\
0 & 1
\end{array}\right), \quad C_{2}=\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right), \quad C_{3}=\left(\begin{array}{ll}
0 & 0 \\
1 & 0
\end{array}\right) . \tag{4.147}
\end{align*}
$$

Then for $y=(x, Z) \in D^{1}$ and $v=(h, U) \in W[J]$ we have

$$
\begin{equation*}
X_{2}(x)[h, Z]=-6\left(x_{1}-t\right)\left(C_{3} Z C_{2}, C_{3} Z C_{3}\right) h, \tag{4.148}
\end{equation*}
$$

$$
\begin{align*}
f_{0}(y) h= & Z(-1)^{*} C_{2} h(-1)+Z(1)^{*} C_{2} h(1)  \tag{4.149}\\
& +2 \alpha^{2}\left(3 x_{2}(0)^{2}-\beta\right) Z(0)^{*} C_{1} h(0) \\
f_{1}(y) U= & \left(g_{1}[x] N_{1}[U(-1)]+g_{3}[x] N_{1}[U(1)]\right.  \tag{4.150}\\
& \left.+2 \alpha x_{2}(0) g_{2}[x] N_{2}[U(0)]\right) *
\end{align*}
$$

We choose the operators $Y, l_{0}$ and $l_{1}$ as follows:

$$
\begin{equation*}
Y h=X_{2}\left(x^{(0)}\right)\left[h, Z^{(0)}\right], \quad l_{0}=f_{0}\left(y^{(0)}\right), \quad l_{1}=f_{1}\left(y^{(0)}\right) \tag{4.151}
\end{equation*}
$$

For simplicity put

$$
\begin{align*}
& m=10^{-3}, \quad m_{1}=-0.1 m v^{3}, \quad a=2 \alpha^{2}(3-\beta), \quad a_{1}=2 \alpha^{2}(1-\beta),  \tag{4.152}\\
& a_{2}=\mu a, \quad a_{3}=-0.2 v a_{1}, \quad B_{1}=\Phi(0)^{*} C_{1}, \quad B_{2}=\Phi(1)^{*} C_{2}, \\
& C_{4}=\mu C_{2}+\nu C_{1}, \quad C_{5}=\nu C_{2}+\mu C_{1}, \quad C_{6}=\mu C_{3}-\nu C_{3}^{*} \\
& e=(1,1)^{*}, \quad u_{1}(t)=1+2 c(t), \quad u_{2}(t)=1-c(t),
\end{align*}
$$

$$
\begin{aligned}
& u_{3}(t)=1-c(t)^{3}, \quad u_{4}(t)=\mu(t+1), \quad u_{5}(t)=2+c(t)^{2}, \\
& u_{6}(t)=2+s(t)^{2}, \quad V(t)=\mu \Phi(t)^{*} C_{2} \Phi(t), \\
& V_{1}(t)=v\left(\begin{array}{cc}
-u_{3}(t) & -v s(t)^{3} \\
\mu s(t) u_{5}(t) & u_{3}(t)
\end{array}\right), \\
& V_{2}(t)=v^{2}\left(\begin{array}{cc}
-s(t)^{3} & v\left\{c(t) u_{6}(t)-2\right\} \\
\mu u_{3}(t) & s(t)^{3}
\end{array}\right), \\
& V_{3}(t)=\left(V_{1}(t)^{*}, V_{2}(t)^{*}\right) N_{2}[\Phi(0)]^{*}, \\
& V_{4}(t)=3 v\left\{C_{5} V(t)+u_{4}(t) C_{6}-C_{2}\right\} .
\end{aligned}
$$

Then by (4.145) and (4.151)
(4.153) $\quad G=C_{2}+\nu V(1)+a_{2}\left(C_{4}-V(0)\right)+a_{3} V_{3}(0)$,
(4.154) $\quad S_{0}(t)=\Phi(t) G^{-1}, \quad S_{1}(t)=-0.2 v \Phi(t)\left(V_{1}(t), V_{2}(t)\right) G^{-1}$,
(4.155) $\quad S_{2} E U=a_{1} S_{0}(t) \int_{-1}^{0} N_{2}\left[\Phi(0) \Phi_{I}(\tau) U(\tau)\right]^{*} d \tau \quad$ for $\quad U \in M[J]$,

$$
\begin{equation*}
S_{3} E U=-\Phi(t) \int_{-1}^{t} \Phi_{I}(\tau)\left\{0.6 C_{3} \Phi(\tau) N_{1}\left[S_{2} E U\right](\tau)+U(\tau)\right\} d \tau \tag{4.156}
\end{equation*}
$$

for $U \in M[J]$,

$$
\begin{equation*}
H_{0} h=\int_{-1}^{1} H_{0}(t, \tau) h(\tau) d \tau \quad \text { for } \quad h \in C[J], \tag{4.157}
\end{equation*}
$$

where

$$
\begin{align*}
& H_{0}(t, \tau)=\left\{\begin{array}{cc}
\Phi(t)\left(I-M_{1}(\tau)\right) \Phi_{I}(\tau), & \tau<t, \\
-\Phi(t) M_{1}(\tau) \Phi_{I}(\tau), & \tau \geqq t
\end{array} \quad(-1 \leqq \tau<0),\right.  \tag{4.158}\\
& H_{0}(t, \tau)=\left\{\begin{array}{ccc}
\Phi(t)\left(I-M_{2}\right) \Phi_{I}(\tau), & \tau<t, \\
-\Phi(t) M_{2} \Phi_{I}(\tau), & \tau \geqq t & (0 \leqq \tau \leqq 1),
\end{array}\right.  \tag{4.159}\\
& M_{1}(\tau)=G^{-1}\left\{a B_{1} \Phi(0)+a_{3}\left(V_{3}(0)-V_{3}(\tau)\right)\right\}+M_{2}, \\
& M_{2}=G^{-1} B_{2} \Phi(1) .
\end{align*}
$$

By (4.142) and (4.151) we have

$$
\begin{equation*}
Q x^{(0)}=m(0, t+1)^{*}, \quad Q_{1} y^{(0)}=0, \tag{4.160}
\end{equation*}
$$

$$
\begin{align*}
& f\left[y^{(0)}\right]=a_{1}(-\mu s(0), c(0))^{*}, \quad E_{1} Q x^{(0)}=m v^{2}\left(u_{2}(t), \mu s(t)\right)^{*},  \tag{4.161}\\
& l_{2}\left[E_{1} Q x^{(0)}\right]= m v\left\{a s(0) B_{1}+v u_{2}(1) B_{2}\right\} e \\
&+m_{1} a_{1}\binom{s(0)(1-4 c(0))+3 \mu c(0)}{3 s(0)-2 v u_{1}(0) u_{2}(0)} .
\end{align*}
$$

Let $b=\left(b_{1}, b_{2}\right)^{*}, b_{3}$ and $b_{4}$ be defined by

$$
\begin{equation*}
b=G^{-1}\left(f\left[y^{(0)}\right]-l_{2}\left[E_{1} Q x^{(0)}\right]\right) \tag{4.163}
\end{equation*}
$$

$$
\begin{equation*}
b_{3}=2\left(\mu^{2} b_{1} / m-1\right), \quad b_{4}=2 \mu^{2} b_{2} / m \tag{4.164}
\end{equation*}
$$

Then we have

$$
\begin{equation*}
L_{I} F y^{(0)}=(h, U) \tag{4.165}
\end{equation*}
$$

where

$$
\begin{equation*}
h(t)=\Phi(t) b+\left[E_{1} Q x^{(0)}\right](t) \tag{4.166}
\end{equation*}
$$

Now let us use the infinity norm $\|\cdot\|_{\infty}$ and apply Theorem 5 to our problem. Then by (4.153)-(4.159) we have the estimates

$$
\begin{align*}
& \left\|S_{0}\right\|_{\infty c} \leqq 2.50387, \quad\left\|S_{1}\right\|_{\infty c} \leqq 2.32728, \quad\left\|S_{2} E\right\|_{\infty c} \leqq 0.45284 m  \tag{4.168}\\
& \left\|S_{3} E\right\|_{\infty c} \leqq 2.85033, \quad\left\|H_{0}\right\|_{\infty c} \leqq 3.18136 \\
& \left\|H_{1}\right\|_{\infty c} \leqq\|E Y\|_{\infty c}\left\|H_{0}\right\|_{\infty c} \leqq 5.35949
\end{align*}
$$

For any $p>0$ and $q>0$ by (4.143)-(4.151) we may choose

$$
\begin{equation*}
\mu_{1}=3 p \delta(p \delta+0.2), \quad \mu_{2}=p \mu_{20}+q \mu_{21}, \quad \mu_{4}=6 \delta(p q \delta+0.1 q+\sigma) \tag{4.169}
\end{equation*}
$$

where

$$
\begin{align*}
\mu_{20} & =2 q \delta\left\{1+3 \alpha^{2} p(p \delta+2)\left(\delta+\sigma_{1}\right)+\alpha^{2}|3-\beta|\right\}  \tag{4.170}\\
\mu_{21} & =2 p \delta\left\{1+\alpha^{2}(p \delta+2)(\delta+1)+\alpha^{2}|1-\beta|\right\}  \tag{4.171}\\
\sigma & =p \max _{t \in J}(|c(t)|+\mu|s(t)|), \quad \sigma_{1}=q^{-1} \mu s(0) \tag{4.172}
\end{align*}
$$

By (4.165)-(4.167)

$$
\begin{equation*}
\left\|L_{I} F y^{(0)}\right\|_{\infty w} \leqq \max \left(p^{-1} \eta_{0}, q^{-1} \eta_{1}\right)=\eta \tag{4.173}
\end{equation*}
$$

where

$$
\begin{equation*}
\|h\|_{\infty c} \leqq 1.65924 m=\eta_{0}, \quad\|U\|_{\infty c c} \leqq 0.63151 m=\eta_{1} \tag{4.174}
\end{equation*}
$$

The choice $p=1, q=1$ and $\delta=1.79003 m$ yields

$$
\kappa=0.073058, \quad \lambda=\eta /(1-\kappa)=1.79002 m=\lambda(1,1),
$$

and we have estimates

$$
\begin{equation*}
\left\|\hat{x}-x^{(0)}\right\|_{\infty c} \leqq \lambda(1,1), \quad\left\|Z-Z^{(0)}\right\|_{\infty c} \leqq \lambda(1,1) . \tag{4.175}
\end{equation*}
$$

With the choice $p=1, q=q_{1}=2.2603$ and $\delta=1.73539 m$ we have

$$
\kappa=0.043875, \quad \lambda=1.73538 m=\lambda\left(1, q_{1}\right) .
$$

The choice $p=p_{1}=2.6274, q=1$ and $\delta=0.76346 m$ yields

$$
\kappa=0.172819, \quad \lambda=0.76345 m=\lambda\left(p_{1}, 1\right)
$$

Hence we have error estimates

$$
\begin{equation*}
\left\|\hat{x}-x^{(0)}\right\|_{\infty c} \leqq \lambda\left(1, q_{1}\right), \quad\left\|Z-Z^{(0)}\right\|_{\infty c} \leqq \lambda\left(p_{1}, 1\right) . \tag{4.176}
\end{equation*}
$$

From (4.175) and (4.176) it is seen that the parameters $p$ and $q$ have been introduced with effect. The same conclusion is valid also when the norms $\|\cdot\|_{2}$ and $\|\cdot\|_{1}$ are used. The results are listed in Table 2, where $\tilde{\eta}=\eta / m, \tilde{\delta}=\delta / m, \tilde{\kappa}=10 \kappa$ and $\tilde{\lambda}(p, q)=\lambda(p, q) / m$.

Table 2.

| norm | $p$ | $q$ | $\tilde{\eta}$ | $\tilde{\delta}$ | $\tilde{\boldsymbol{\kappa}}$ | $\tilde{\lambda}(p, q)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\\|\cdot\\|_{\infty}$ | 1.0000 | 1.0000 | 1.65924 | 1.79003 | 0.73058 | 1.79002 |
