# Edge connectivity and restricted edge connectivity of cartesian product of graphs 

Maho Yokota<br>(Received October 14, 2018; Revised November 26, 2018)

#### Abstract

An edge cutset $E \subset E(G)$ of a graph $G$ is called a restricted edge cutset if every component of $G-E$ has order at least 2 . We let $\lambda^{\prime}(G)$ denote the minimum cardinality of a restricted edge cutset of $G$, and let $\delta^{\prime}(G)$ denote the minimum of $\operatorname{deg}_{G}(x)+\operatorname{deg}_{G}(y)-2$ as $x$ and $y$ range over all adjacent vertices of $G$. We let $\lambda(G)$ and $\delta(G)$ denote the edge connectivity and the minimum degree of $G$, respectively. Among other results, we show that if $G_{1}$ and $G_{2}$ are graphs such that $\lambda\left(G_{i}\right)=\delta\left(G_{i}\right) \geq 2$ and $\lambda^{\prime}\left(G_{i}\right)=\delta^{\prime}\left(G_{i}\right) \geq 2$ for each $i=1,2$, then $\lambda^{\prime}\left(G_{1} \otimes G_{2}\right)=\delta^{\prime}\left(G_{1} \otimes G_{2}\right)=\min \left\{\delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right), \delta^{\prime}\left(G_{2}\right)+2 \delta\left(G_{1}\right)\right\}$, where $G_{1} \otimes G_{2}$ denotes the cartesian product of $G_{1}$ and $G_{2}$.

## §1. Introduction

We start by defining several invariants of a graph. We call an edge cutset $E \subset E(G)$ of a graph $G$ a restricted edge cutset when every component of $G-E$ has at least 2 vertices. For a graph $G$, we define the values $\delta(G), \delta^{\prime}(G), \lambda(G)$ and $\lambda^{\prime}(G)$ by

$$
\begin{aligned}
\delta(G) & \left.:=\min _{x \in V(G)} \operatorname{deg}_{G}(x) \quad \text { (the minimum degree of } G\right), \\
\delta^{\prime}(G) & :=\min _{x y \in E(G)} \operatorname{deg}_{G}(x)+\operatorname{deg}_{G}(y)-2,
\end{aligned}
$$

$\lambda(G):=\min \{|E| \mid E$ is an edge cutset of $G\} \quad$ (the edge connectivity of $G$ ), $\lambda^{\prime}(G):=\min \{|E| \mid E$ is a restricted edge cutset of $G\}$.

When $G$ has no restricted edge cutset, for example when $G$ is a star, we do not define $\lambda^{\prime}(G)$. We remark that if $\lambda^{\prime}(G)$ is defined, then $|V(G)| \geq 4$. In
fact, for a connected graph $G, \lambda^{\prime}(G)$ is defined if and only if $|V(G)| \geq 4$ and $G$ is not a star (see Lemma 2.2). Among these invariants, we have inequalities $\delta(G) \geq \lambda(G)$ and $\lambda^{\prime}(G) \geq \lambda(G)$. We also have $\delta^{\prime}(G) \geq \lambda^{\prime}(G)$ (see Lemma 2.2).

Next we introduce the notions of super edge connected graphs and super restricted edge connected graphs. A connected graph $G$ of order at least 2 is called super edge connected when $G-E$ has a component of order 1 for any minimum edge cutset $E$. Similarly, a connected graph $G$ for which $\lambda^{\prime}(G)$ is defined is called super restricted edge connected when $G-E$ has a component of order 2 for any minimum restricted edge cutset $E$. When $G$ has no restricted edge cutset, we define $G$ not to be super restricted edge connected. For sufficient conditions for a graph to be super edge connected/super restricted edge connected, see [3], [4], [6], and [7].

In [5], Wang and Wang studied $\lambda(G)$ and $\lambda^{\prime}(G)$ when $G$ is the 2-expanded $k$-ary $n$-cube graph. Here for integers $m, k, n$ with $m \geq 2, k \geq 2 m+1$ and $n \geq 1$, the $m$-expanded $k$-ary $n$-cube graph (denoted by $m$ - $Q_{k}^{n}$ ) is the graph defined as follows:

$$
\begin{aligned}
V\left(m-Q_{k}^{n}\right) & =\left\{\left(u_{1}, u_{2}, \ldots, u_{n}\right) \mid u_{i} \in \mathbb{Z} / k \mathbb{Z} \text { for all } i \in\{1,2, \ldots, n\}\right\}, \\
E\left(m-Q_{k}^{n}\right) & =\left\{\left(u_{1}, u_{2}, \ldots, u_{n}\right)\left(v_{1}, v_{2}, \ldots, v_{n}\right) \mid \text { there exists } j \in\{1,2, \ldots, n\}\right. \\
& \text { such that } u_{j}=v_{j}+g \text { for some } g \in\{-m, \cdots-2,-1,1,2, \ldots m\} \\
& \text { and } \left.u_{i}=v_{i} \text { for all } i \in\{1,2, \ldots, n\} \backslash\{j\}\right\} .
\end{aligned}
$$

In [5], it is proved that if $k \geq 6$ and $n \geq 3$, then $\lambda\left(2-Q_{k}^{n}\right)=4 n$ and $\lambda^{\prime}\left(2-Q_{k}^{n}\right)=$ $8 n-2$, and $2-Q_{k}^{n}$ is super edge connected and super restricted edge connected. In this paper, we generalize this results to $m-Q_{k}^{n}$ and show that the following statement holds.

Proposition 1.1. Let $m, k, n$ be integers with $m \geq 2, k \geq 2 m+1$ and $n \geq 2$. Then $\lambda\left(m-Q_{k}^{n}\right)=2 m n$ and $\lambda^{\prime}\left(m-Q_{k}^{n}\right)=4 m n-2$. Furthermore, $m-Q_{k}^{n}$ is super edge connected and super restricted edge connected.

Graphs $m-Q_{k}^{n}$ have some good properties, and are useful in information theory (see [1], [2]). However, they form a rather restricted class of graphs, and it is desirable that one should obtain a more general result. In this paper, as we describe below, we actually derive Proposition 1.1 from more general results.

For integers $m, k$ with $m \geq 2$ and $k \geq 2 m+1$, let $H_{k, m}$ be the graph defined as follows:

$$
\begin{aligned}
& V\left(H_{k, m}\right)=\mathbb{Z} / k \mathbb{Z} \\
& E\left(H_{k, m}\right)=\{u v \mid u=v+g \text { for some } g \in\{-m, \ldots,-2,-1,1,2, \ldots, m\}\} .
\end{aligned}
$$

The graph $H_{k, m}$ is called the $m$-th power of the cycle of order $k$. As remarked in [5], the $m$-expanded $k$-ary $n$-cube graph is the cartesian product of $n$ copies of $H_{k, m}$. Here, for two graphs $G_{1}$ and $G_{2}$, the cartesian product $G_{1} \otimes G_{2}$ is the graph defined as follows:

$$
\begin{aligned}
V\left(G_{1} \otimes G_{2}\right) & :=\left\{(x, y) \mid x \in V\left(G_{1}\right), y \in V\left(G_{2}\right)\right\}, \\
E\left(G_{1} \otimes G_{2}\right) & :=\left\{\left(x_{1}, y\right)\left(x_{2}, y\right) \mid x_{1} x_{2} \in E\left(G_{1}\right), y \in V\left(G_{2}\right)\right\} \\
& \cup\left\{\left(x, y_{1}\right)\left(x, y_{2}\right) \mid x \in V\left(G_{1}\right), y_{1} y_{2} \in E\left(G_{2}\right)\right\} .
\end{aligned}
$$

Also observe that if $m \geq 2$ and $k \geq 2 m+1$, then $\lambda\left(H_{k, m}\right)=\delta\left(H_{k, m}\right)=2 m$ and $\lambda^{\prime}\left(H_{k, m}\right)=\delta^{\prime}\left(H_{k, m}\right)=4 m-2$.

Based on these observations, we prove the following two theorems, and show that Proposition 1.1 follows from them.

Theorem 1.2. Let $G_{1}, G_{2}$ be graphs, and suppose that $\lambda\left(G_{i}\right)=\delta\left(G_{i}\right) \geq 1$ for each $i=1,2$. Then $\lambda\left(G_{1} \otimes G_{2}\right)=\delta\left(G_{1} \otimes G_{2}\right)=\delta\left(G_{1}\right)+\delta\left(G_{2}\right)$. Furthermore, unless either $G_{1}$ is a complete graph and $\delta\left(G_{2}\right)=1$ or $G_{2}$ is a complete graph and $\delta\left(G_{1}\right)=1, G_{1} \otimes G_{2}$ is super edge connected.

Theorem 1.3. Let $G_{1}, G_{2}$ be graphs, and suppose that $\lambda\left(G_{i}\right)=\delta\left(G_{i}\right) \geq 2$ and $\lambda^{\prime}\left(G_{i}\right)=\delta^{\prime}\left(G_{i}\right) \geq 2$ for each $i=1,2$. Then $\lambda^{\prime}\left(G_{1} \otimes G_{2}\right)=\delta^{\prime}\left(G_{1} \otimes G_{2}\right)=$ $\min \left\{\delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right), \delta^{\prime}\left(G_{2}\right)+2 \delta\left(G_{1}\right)\right\}$. Furthermore, unless either $G_{1}$ is a complete graph and $\delta\left(G_{2}\right)=2$ or $G_{2}$ is a complete graph and $\delta\left(G_{1}\right)=2$, $G_{1} \otimes G_{2}$ is super restricted edge connected.

We prove preliminary lemmas in Section 2, and prove Theorem 1.2 and Theorem 1.3 in Section 3. In Section 4, we prove two corollaries, which immediately imply Proposition 1.1.

After submitting the first version of this paper, we become aware that Xu and Yang had already proved the following theorem.

Theorem 1.4 (Xu and Yang 2006 [8]). Let $G_{1}, G_{2}$ be connected graphs. Then $\lambda\left(G_{1} \otimes G_{2}\right)=\min \left\{\delta\left(G_{1}\right)+\delta\left(G_{2}\right), \lambda\left(G_{1}\right)\left|V\left(G_{2}\right)\right|, \lambda\left(G_{2}\right)\left|V\left(G_{1}\right)\right|\right\}$.

The first assetion of Theorem 1.2 is a corollary of Theorem 1.4. However, we have decided to keep the proof of the first assertion as it was in the first version because, in our proof of the second assertion, we make use of the arguments in the proof of the first assertion.

## §2. Preliminaries

In this section, we prepare some notations and lemmas. We start with two lemmas concerning the existence of a restricted edge cutset.

Lemma 2.1. Let $E$ be an edge cutset of a connected graph $G$, and suppose that $G-E$ has two or more components of order at least 2 . Then $E$ contains a restricted edge cutset.

Proof. Let $F_{0} \subset E$ be an edge cutset which minimizes the number of components of order 1 among the edge cutsets $F$ with $F \subset E$ such that $G-F$ has two or more components of order at least 2 . We show that $F_{0}$ is a restricted edge cutset. Suppose that $G-F_{0}$ has a component $C$ of order 1 and write $V(C)=\{v\}$. Let $v w \in F_{0}$. Then $F_{0} \backslash\{v w\}$ is also an edge cutset having the property that $G-\left(F_{0} \backslash\{v w\}\right)$ has two or more components of order at least 2 . On the other hand, the number of components of order 1 in $G-\left(F_{0} \backslash\{v w\}\right)$ is less than the number of components of order 1 in $G-F_{0}$. This contradicts the minimum choice of $F_{0}$.

Lemma 2.2. Let $G$ be a connected graph, and suppose that $|G| \geq 4$ and $G$ is not a star. Then $\lambda^{\prime}(G)$ is defined and $\lambda^{\prime}(G) \leq \delta^{\prime}(G) \leq 2(|V(G)|-2)$. Furthermore, if $\delta^{\prime}(G)=2(|V(G)|-2)$, then $G$ is a complete graph.

Proof. Let $u v$ be an edge of $G$ with $\operatorname{deg}_{G}(u)+\operatorname{deg}_{G}(v)-2=\delta^{\prime}(G)$. Suppose that $E(G-\{u, v\})=\emptyset$. We can write $V(G) \backslash\{u, v\}=A \cup B$ with $A \cap B=\emptyset$ so that each vertex in $A$ is adjacent to $u$ and each vertex in $B$ is adjacent to $v$. Since $G$ is not a star, we can take $A$ and $B$ so that they further satisfy $A \neq \emptyset$ and $B \neq \emptyset$. Then $\operatorname{deg}_{G}(v) \geq|B|+1$. Take $x \in A$. From $E(G-\{u, v\})=\emptyset$, we get $\operatorname{deg}_{G}(x) \leq 2$. On the other hand, $\operatorname{deg}_{G}(x) \geq \operatorname{deg}_{G}(v)$ by the minimality of $\operatorname{deg}_{G}(u)+\operatorname{deg}_{G}(v)$. Hence $2 \geq \operatorname{deg}_{G}(x) \geq \operatorname{deg}_{G}(v) \geq|B|+1$. Consequently $|B|=1$ and $\operatorname{deg}_{G}(x)=2$, which forces $x v \in E(G)$. This implies $\operatorname{deg}_{G}(v) \geq$ $|B|+2=3$, which contradicts the fact that $\operatorname{deg}_{G}(x) \geq \operatorname{deg}_{G}(v)$. Thus $E(G-$ $\{u, v\}) \neq \emptyset$. Let $E$ be the set of edges joining $\{u, v\}$ and $V(G) \backslash\{u, v\}$. Then $\delta^{\prime}(G)=|E| \leq 2(|V(G)|-2)$. Since $E(G-\{u, v\}) \neq \emptyset$, it follows from Lemma 2.1 that $E$ contains a restricted edge cutset $E^{\prime}$. Therefore $\lambda^{\prime}(G)$ is defined, and $\lambda^{\prime}(G) \leq\left|E^{\prime}\right| \leq|E|=\delta^{\prime}(G) \leq 2(|V(G)|-2)$.

Now assume that $\delta^{\prime}(G)=2(|V(G)|-2)$. Then $\operatorname{deg}_{G}(u)=\operatorname{deg}_{G}(v)=$ $|V(G)|-1$, which implies that each of $u$ and $v$ is adjacent to all vertices in $V(G) \backslash\{u, v\}$. From the minimality of $\operatorname{deg}_{G}(u)+\operatorname{deg}_{G}(v)$, we see that $\operatorname{deg}_{G}(x)=|V(G)|-1$ for every $x \in V(G) \backslash\{u, v\}$. This means that $G$ is a complete graph.

Throughout the rest of this section, we let $G_{1}, G_{2}$ be graphs. We investigate edge cutsets of $G_{1} \otimes G_{2}$. We define subset $E_{1}, E_{2}$ of $E\left(G_{1} \otimes G_{2}\right)$ as follows:

$$
\begin{aligned}
& E_{1}:=\left\{\left(x_{1}, y\right)\left(x_{2}, y\right) \mid x_{1} x_{2} \in E\left(G_{1}\right), y \in V\left(G_{2}\right)\right\} \\
& E_{2}:=\left\{\left(x, y_{1}\right)\left(x, y_{2}\right) \mid x \in V\left(G_{1}\right), y_{1} y_{2} \in E\left(G_{2}\right)\right\}
\end{aligned}
$$

It is clear that $E_{1} \cap E_{2}=\emptyset$ and $E\left(G_{1} \otimes G_{2}\right)=E_{1} \cup E_{2}$; thus $\left\{E_{1}, E_{2}\right\}$ is a partition of $E\left(G_{1} \otimes G_{2}\right)$. Next we define the projections $p_{1}$ and $p_{2}$. The mapping from $V\left(G_{1} \otimes G_{2}\right)$ to $V\left(G_{1}\right)$ which associates $x \in V\left(G_{1}\right)$ with each $(x, y) \in V\left(G_{1} \otimes G_{2}\right)$ is denoted by $p_{1}$; similarly, the mapping from $V\left(G_{1} \otimes G_{2}\right)$ to $V\left(G_{2}\right)$ which associates $y \in V\left(G_{2}\right)$ with each $(x, y) \in V\left(G_{1} \otimes G_{2}\right)$ is denoted by $p_{2}$. For $S \subset V\left(G_{1} \otimes G_{2}\right), p_{1}(S)$ and $p_{2}(S)$ denote the image of $S$ by $p_{1}$ and $p_{2}$, respectively; thus

$$
\begin{aligned}
p_{1}(S) & :=\left\{x \in V\left(G_{1}\right) \mid(x, y) \in S \text { for some } y \in V\left(G_{2}\right)\right\}, \\
p_{2}(S) & :=\left\{y \in V\left(G_{2}\right) \mid(x, y) \in S \text { for some } x \in V\left(G_{1}\right)\right\} .
\end{aligned}
$$

We can regard $G_{1} \otimes G_{2}$ as $\left|V\left(G_{2}\right)\right|$ copies of $G_{1}$ joined by edges in $E_{2}$. For $v \in V\left(G_{2}\right), G_{1}^{v}$ denotes the copy of $G_{1}$ corresponding to $v$; i.e., $G_{1}^{v}$ is the subgraph of $G_{1} \otimes G_{2}$ induced by $\left\{(x, v) \mid x \in V\left(G_{1}\right)\right\}$. Similarly we define $G_{2}^{v}$ as the copy of $G_{2}$ corresponding to $v$ for $v \in V\left(G_{1}\right)$.

We now prove some lemmas. We use them to obtain lower bounds of $\lambda\left(G_{1} \otimes G_{2}\right)$ and $\lambda^{\prime}\left(G_{1} \otimes G_{2}\right)$ in Section 3.

Lemma 2.3. Let $G_{1}, G_{2}$ be connected graphs of order at least 2. Let $E \subset$ $E\left(G_{1} \otimes G_{2}\right)$ be a minimal edge cutset of $G_{1} \otimes G_{2}$, and let $C_{1}, C_{2}$ be the components of $\left(G_{1} \otimes G_{2}\right)-E$. Then one of the following holds:
(i) $p_{i}\left(V\left(C_{1}\right)\right)=p_{i}\left(V\left(C_{2}\right)\right)=V\left(G_{i}\right)$ for some $i$ and $|E| \geq\left|V\left(G_{i}\right)\right| \lambda\left(G_{3-i}\right)$; or
(ii) $p_{1}\left(V\left(C_{j}\right)\right) \subsetneq V\left(G_{1}\right), p_{2}\left(V\left(C_{j}\right)\right) \subsetneq V\left(G_{2}\right)$ for some $j$ and $|E| \geq \lambda\left(G_{1}\right)+$ $\lambda\left(G_{2}\right)$ and, if we have $|E|=\lambda\left(G_{1}\right)+\lambda\left(G_{2}\right)$, then $\left|V\left(C_{j}\right)\right|=1$.

Proof. First assume $p_{i}\left(V\left(C_{1}\right)\right)=p_{i}\left(V\left(C_{2}\right)\right)=V\left(G_{i}\right)$ for some $i$. We may assume that $p_{1}\left(V\left(C_{1}\right)\right)=p_{1}\left(V\left(C_{2}\right)\right)=V\left(G_{1}\right)$ without loss of generality. Then for each $v \in V\left(G_{1}\right), V\left(G_{2}^{v}\right) \cap V\left(C_{1}\right) \neq \emptyset$ and $V\left(G_{2}^{v}\right) \cap V\left(C_{2}\right) \neq \emptyset$. These two vertex sets are separated in $G_{2}^{v}$ by $E \cap E\left(G_{2}^{v}\right)$, and hence $\left|E \cap E\left(G_{2}^{v}\right)\right| \geq \lambda\left(G_{2}\right)$. Consequently, $|E| \geq \sum_{v \in V\left(G_{1}\right)}\left|E \cap E\left(G_{2}^{v}\right)\right| \geq\left|V\left(G_{1}\right)\right| \lambda\left(G_{2}\right)$, which implies that (i) holds.

Thus we may assume that we have $p_{1}\left(V\left(C_{1}\right)\right) \subsetneq V\left(G_{1}\right)$ or $p_{1}\left(V\left(C_{2}\right)\right) \subsetneq$ $V\left(G_{1}\right)$, and we also have $p_{2}\left(V\left(C_{1}\right)\right) \subsetneq V\left(G_{2}\right)$ or $p_{2}\left(V\left(C_{2}\right)\right) \subsetneq V\left(G_{2}\right)$. By the symmetry of roles of $C_{1}$ and $C_{2}$, we may assume $p_{1}\left(V\left(C_{1}\right)\right) \subsetneq V\left(G_{1}\right)$. Let $x \in$ $V\left(G_{1}\right) \backslash p_{1}\left(V\left(C_{1}\right)\right)$. Then for any $y \in V\left(G_{2}\right),(x, y)$ does not belong to $C_{1}$, and hence it belongs to $C_{2}$. Thus $p_{2}\left(V\left(C_{2}\right)\right)=V\left(G_{2}\right)$. In view of the assumption made at the beginning of this paragraph, this implies $p_{2}\left(V\left(C_{1}\right)\right) \subsetneq V\left(G_{2}\right)$. Consequently, for each $v \in p_{1}\left(V\left(C_{1}\right)\right), V\left(G_{2}^{v}\right) \cap V\left(C_{1}\right) \neq \emptyset$ and $V\left(G_{2}^{v}\right) \cap$ $V\left(C_{2}\right) \neq \emptyset$. Arguing as in the first paragraph, we therefore obtain $\left|E \cap E_{2}\right| \geq$ $\left|p_{1}\left(V\left(C_{1}\right)\right)\right| \lambda\left(G_{2}\right)$. Similarly we obtain $\left|E \cap E_{1}\right| \geq\left|p_{2}\left(V\left(C_{1}\right)\right)\right| \lambda\left(G_{1}\right)$. It now
follows that

$$
\begin{aligned}
|E| & =\left|E \cap E_{1}\right|+\left|E \cap E_{2}\right| \\
& \geq\left|p_{2}\left(V\left(C_{1}\right)\right)\right| \lambda\left(G_{1}\right)+\left|p_{1}\left(V\left(C_{1}\right)\right)\right| \lambda\left(G_{2}\right) \\
& \geq \lambda\left(G_{1}\right)+\lambda\left(G_{2}\right) .
\end{aligned}
$$

Further if $|E|=\lambda\left(G_{1}\right)+\lambda\left(G_{2}\right)$, then $\left|p_{2}\left(V\left(C_{1}\right)\right)\right| \lambda\left(G_{1}\right)+\left|p_{1}\left(V\left(C_{1}\right)\right)\right| \lambda\left(G_{2}\right)=$ $\lambda\left(G_{1}\right)+\lambda\left(G_{2}\right)$, and hence $\left|p_{1}\left(V\left(C_{1}\right)\right)\right|=\left|p_{2}\left(V\left(C_{1}\right)\right)\right|=1$, which implies $\left|V\left(C_{1}\right)\right|=1$. Thus (ii) holds.

Lemma 2.4. Let $G_{1}, G_{2}$ be graphs, and suppose that $\lambda\left(G_{i}\right) \geq 2$ and $\lambda^{\prime}\left(G_{i}\right)$ is defined for each $i=1,2$. Let $E \subset E\left(G_{1} \otimes G_{2}\right)$ be a minimal restricted edge cutset of $G_{1} \otimes G_{2}$, and let $C_{1}, C_{2}$ be the components of $\left(G_{1} \otimes G_{2}\right)-E$. Then at least one of the following holds:
(i) $p_{i}\left(V\left(C_{1}\right)\right)=p_{i}\left(V\left(C_{2}\right)\right)=V\left(G_{i}\right)$ for some $i$, and $|E| \geq\left|V\left(G_{i}\right)\right| \lambda\left(G_{3-i}\right)$;
(ii) $p_{1}\left(V\left(C_{j}\right)\right) \subsetneq V\left(G_{1}\right)$ and $p_{2}\left(V\left(C_{j}\right)\right) \subsetneq V\left(G_{2}\right)$ for some $j, E \cap E_{1} \neq \emptyset$, and $|E| \geq \lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right)$ and, if we have $|E|=\lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right)$, then $\left|V\left(C_{j}\right)\right|=2$; or
(iii) $p_{1}\left(V\left(C_{j}\right)\right) \subsetneq V\left(G_{1}\right)$ and $p_{2}\left(V\left(C_{j}\right)\right) \subsetneq V\left(G_{2}\right)$ for some $j, E \cap E_{2} \neq \emptyset$, and $|E| \geq 2 \lambda\left(G_{1}\right)+\lambda^{\prime}\left(G_{2}\right)$ and, if we have $|E|=2 \lambda\left(G_{1}\right)+\lambda^{\prime}\left(G_{2}\right)$, then $\left|V\left(C_{j}\right)\right|=2$.

Proof. Arguing as in the first paragraph of the proof of Lemma 2.3, we see that if $p_{i}\left(V\left(C_{1}\right)\right)=p_{i}\left(V\left(C_{2}\right)\right)=V\left(G_{i}\right)$ for some $i$, then (i) holds. Thus arguing as in the first half of the second paragraph of the proof of Lemma 2.3, we may assume $p_{1}\left(V\left(C_{1}\right)\right) \subsetneq V\left(G_{1}\right)$ and $p_{2}\left(V\left(C_{1}\right)\right) \subsetneq V\left(G_{2}\right)$. Since $E$ is a restricted edge cutset, $C_{1}$ contains an edge. Let $e \in E\left(C_{1}\right)$ be an edge. Assume first that $e \in E_{1}$. We show that (ii) holds. For each $v \in p_{1}\left(V\left(C_{1}\right)\right)$, we have $V\left(G_{2}^{v}\right) \cap V\left(C_{1}\right) \neq \emptyset$ and $V\left(G_{2}^{v}\right) \cap V\left(C_{2}\right) \neq \emptyset$, and hence $\left|E \cap E_{2}\right| \geq$ $\left|p_{1}\left(V\left(C_{1}\right)\right)\right| \lambda\left(G_{2}\right)$. Let $v \in V\left(G_{2}\right)$ be the vertex such that $e \in E\left(G_{1}^{v}\right)$. We focus on $G_{1}^{v}$. We have $V\left(G_{1}^{v}\right) \cap V\left(C_{1}\right) \neq \emptyset$ and $V\left(G_{1}^{v}\right) \cap V\left(C_{2}\right) \neq \emptyset$. Now we distinguish two cases.

Case 1: $E\left(G_{1}^{v}\right) \cap E\left(C_{2}\right) \neq \emptyset$.
In this case, $\left|E \cap E\left(G_{1}^{v}\right)\right| \geq \lambda^{\prime}\left(G_{1}\right)$ by Lemma 2.1. Hence

$$
\begin{aligned}
|E| & =\left|E \cap E\left(G_{1}^{v}\right)\right|+\left|E \cap E_{2}\right|+\left|E \cap\left(E_{1} \backslash E\left(G_{1}^{v}\right)\right)\right| \\
& \geq \lambda^{\prime}\left(G_{1}\right)+\left|p_{1}\left(V\left(C_{1}\right)\right)\right| \lambda\left(G_{2}\right)+\left|E \cap\left(E_{1} \backslash E\left(G_{1}^{v}\right)\right)\right| \\
& \geq \lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right)+\left|E \cap\left(E_{1} \backslash E\left(G_{1}^{v}\right)\right)\right| .
\end{aligned}
$$

Thus $|E| \geq \lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right)+\left|E \cap\left(E_{1} \backslash E\left(G_{1}^{v}\right)\right)\right|$.

Now if $|E|=\lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right)$, then $\left|p_{1}\left(V\left(C_{1}\right)\right)\right|=2$ and $\left|E \cap\left(E_{1} \backslash E\left(G_{1}^{v}\right)\right)\right|=$ 0 by the above inequality. From $\left|E \cap\left(E_{1} \backslash E\left(G_{1}^{v}\right)\right)\right|=0$, we get $\left|p_{2}\left(V\left(C_{1}\right)\right)\right|=1$, which implies $\left|V\left(C_{1}\right)\right|=2$.

Case 2: $E\left(G_{1}^{v}\right) \cap E\left(C_{2}\right)=\emptyset$.
There are at least $\left|V\left(G_{1}\right)\right|-\left|p_{1}\left(V\left(C_{1}\right)\right)\right|$ vertices in $V\left(G_{1}^{v}\right) \cap V\left(C_{2}\right)$ and they are isolated in $G_{1}^{v}-C_{1}$. Hence every edge of $G_{1}^{v}$ incident with a vertex in $V\left(G_{1}^{v}\right) \cap V\left(C_{2}\right)$ is contained in $E \cap E\left(G_{1}^{v}\right)$. Since $\delta\left(G_{i}\right) \geq \lambda\left(G_{i}\right) \geq 2$ for each $i$, it follows from Lemma 2.2 that

$$
\begin{aligned}
|E| & =\left|E \cap E\left(G_{1}^{v}\right)\right|+\left|E \cap E_{2}\right|+\left|E \cap\left(E_{1} \backslash E\left(G_{1}^{v}\right)\right)\right| \\
& \geq\left(\left|V\left(G_{1}\right)\right|-\left|p_{1}\left(V\left(C_{1}\right)\right)\right|\right) \delta\left(G_{1}\right)+\left|p_{1}\left(V\left(C_{1}\right)\right)\right| \lambda\left(G_{2}\right) \\
& \geq 2\left(\left|V\left(G_{1}\right)\right|-\left|p_{1}\left(V\left(C_{1}\right)\right)\right|\right)+\left(\left|p_{1}\left(V\left(C_{1}\right)\right)\right|-2\right) \lambda\left(G_{2}\right)+2 \lambda\left(G_{2}\right) \\
& \geq 2\left(\left|V\left(G_{1}\right)\right|-\left|p_{1}\left(V\left(C_{1}\right)\right)\right|\right)+2\left(\left|p_{1}\left(V\left(C_{1}\right)\right)\right|-2\right)+2 \lambda\left(G_{2}\right) \\
& =2\left(\left|V\left(G_{1}\right)\right|-2\right)+2 \lambda\left(G_{2}\right) \\
& \geq \lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right) .
\end{aligned}
$$

Suppose that $|E|=\lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right)$. Then $\delta\left(G_{1}\right)=2$ and $\lambda^{\prime}\left(G_{1}\right)=$ $2\left(\left|V\left(G_{1}\right)\right|-2\right)$. By Lemma 2.2, $G_{1}$ is a complete graph. Hence from $\delta\left(G_{1}\right)=2$, we see that $\left|V\left(G_{1}\right)\right|=3$, which contradicts the assumption that $\lambda^{\prime}\left(G_{1}\right)$ is defined. Thus $|E|>\lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right)$.

We have shown that if $e \in E_{1}$, then (ii) holds. Similarly, if $e \in E_{2}$, then (iii) holds. This completes the proof of the lemma.

## §3. Proof of Main Theorems

First we prove Theorem 1.2.
Proof. First we verify that $\lambda\left(G_{1} \otimes G_{2}\right) \leq \delta\left(G_{1} \otimes G_{2}\right) \leq \delta\left(G_{1}\right)+\delta\left(G_{2}\right)$. Let $x \in V\left(G_{1}\right), y \in V\left(G_{2}\right)$ be vertices which attain the minimum degree of $G_{1}$ and $G_{2}$, respectively; namely, $\operatorname{deg}_{G_{1}}(x)=\delta\left(G_{1}\right)$ and $\operatorname{deg}_{G_{2}}(y)=\delta\left(G_{2}\right)$. Then $\operatorname{deg}_{G_{1} \otimes G_{2}}((x, y))=\operatorname{deg}_{G_{1}}(x)+\operatorname{deg}_{G_{2}}(y)=\delta\left(G_{1}\right)+\delta\left(G_{2}\right)$ by the definition of cartesian product. Since we clearly have $\lambda\left(G_{1} \otimes G_{2}\right) \leq \delta\left(G_{1} \otimes G_{2}\right)$, we get $\lambda\left(G_{1} \otimes G_{2}\right) \leq \delta\left(G_{1} \otimes G_{2}\right) \leq \delta\left(G_{1}\right)+\delta\left(G_{2}\right)$.

Next we prove $\lambda\left(G_{1} \otimes G_{2}\right) \geq \delta\left(G_{1}\right)+\delta\left(G_{2}\right)$. Let $E$ be an edge cutset of $G_{1} \otimes G_{2}$. We may assume that $E$ is a minimal edge cutset. By Lemma 2.3,

$$
|E| \geq \min \left\{\left|V\left(G_{1}\right)\right| \lambda\left(G_{2}\right),\left|V\left(G_{2}\right)\right| \lambda\left(G_{1}\right), \lambda\left(G_{1}\right)+\lambda\left(G_{2}\right)\right\}
$$

By easy calculations, we get

$$
\left|V\left(G_{1}\right)\right| \lambda\left(G_{2}\right) \geq\left|V\left(G_{1}\right)\right|+\lambda\left(G_{2}\right)-1 \geq \lambda\left(G_{1}\right)+\lambda\left(G_{2}\right)
$$

Similarly $\left|V\left(G_{2}\right)\right| \lambda\left(G_{1}\right) \geq \lambda\left(G_{1}\right)+\lambda\left(G_{2}\right)$. Since $\lambda\left(G_{i}\right)=\delta\left(G_{i}\right)$ for each $i$ by assumption, it follows that $|E| \geq \lambda\left(G_{1}\right)+\lambda\left(G_{2}\right)=\delta\left(G_{1}\right)+\delta\left(G_{2}\right)$. Since $E$ is an arbitrary edge cutset, we get $\lambda\left(G_{1} \otimes G_{2}\right) \geq \delta\left(G_{1}\right)+\delta\left(G_{2}\right)$. Combining this with the inequality proved in the first paragraph, we obtain $\lambda\left(G_{1} \otimes G_{2}\right)=$ $\delta\left(G_{1} \otimes G_{2}\right)=\delta\left(G_{1}\right)+\delta\left(G_{2}\right)$

We now prove the last assertion of the theorem. Suppose that $G_{1} \otimes G_{2}$ is not super edge connected, and let $E$ be an edge cutset with $|E|=\delta\left(G_{1}\right)+\delta\left(G_{2}\right)$ such that $\left(G_{1} \otimes G_{2}\right)-E$ has no component of order 1. From Lemma 2.3, we see that (i) of Lemma 2.3 holds. By the calculations in the preceding paragraph, we have either $\left|V\left(G_{1}\right)\right| \lambda\left(G_{2}\right)=\left|V\left(G_{1}\right)\right|+\lambda\left(G_{2}\right)-1=\lambda\left(G_{1}\right)+\lambda\left(G_{2}\right)$ or $\left|V\left(G_{2}\right)\right| \lambda\left(G_{1}\right)=\left|V\left(G_{2}\right)\right|+\lambda\left(G_{1}\right)-1=\lambda\left(G_{2}\right)+\lambda\left(G_{1}\right)$. If $\left|V\left(G_{1}\right)\right| \lambda\left(G_{2}\right)=$ $\left|V\left(G_{1}\right)\right|+\lambda\left(G_{2}\right)-1=\lambda\left(G_{1}\right)+\lambda\left(G_{2}\right)$, then it follows from the first equality that $\lambda\left(G_{2}\right)=1$, and it follows from the second equality that $G_{1}$ is a complete graph. Similarly, if $\left|V\left(G_{2}\right)\right| \lambda\left(G_{1}\right)=\left|V\left(G_{2}\right)\right|+\lambda\left(G_{1}\right)-1=\lambda\left(G_{2}\right)+\lambda\left(G_{1}\right)$, then $\lambda\left(G_{1}\right)=1$ and $G_{2}$ is a complete graph. This completes the proof of Theorem 1.2.

Next we prove Theorem 1.3. The outline of the proof is the same as the proof of Theorem 1.2, though some calculations are somewhat complicated.

Proof. By Lemma 2.2, $\lambda^{\prime}\left(G_{1} \otimes G_{2}\right)$ is defined. First, we verify that $\lambda^{\prime}\left(G_{1} \otimes\right.$ $\left.G_{2}\right) \leq \delta^{\prime}\left(G_{1} \otimes G_{2}\right) \leq \min \left\{\delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right), \delta^{\prime}\left(G_{2}\right)+2 \delta\left(G_{1}\right)\right\}$. Let $x_{1} x_{2} \in$ $E\left(G_{1}\right), y \in V\left(G_{2}\right)$ be an edge and a vertex such that $\operatorname{deg}_{G_{1}}\left(x_{1}\right)+\operatorname{deg}_{G_{1}}\left(x_{2}\right)-$ $2=\delta^{\prime}\left(G_{1}\right)$ and $\operatorname{deg}_{G_{2}}(y)=\delta\left(G_{2}\right)$. Then $\operatorname{deg}_{G_{1} \otimes G_{2}}\left(x_{1}, y\right)+\operatorname{deg}_{G_{1} \otimes G_{2}}\left(x_{2}, y\right)-$ $2=\delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right)$ by the definition of cartesian product. Since $\lambda^{\prime}\left(G_{1} \otimes G_{2}\right) \leq$ $\delta^{\prime}\left(G_{1} \otimes G_{2}\right)$ by Lemma 2.2, we get $\lambda^{\prime}\left(G_{1} \otimes G_{2}\right) \leq \delta^{\prime}\left(G_{1} \otimes G_{2}\right) \leq \delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right)$. By swapping the roles of $G_{1}$ and $G_{2}$ in the above argument, we also get $\lambda^{\prime}\left(G_{1} \otimes G_{2}\right) \leq \delta^{\prime}\left(G_{1} \otimes G_{2}\right) \leq \delta^{\prime}\left(G_{2}\right)+2 \delta\left(G_{1}\right)$.

Next we prove $\lambda^{\prime}\left(G_{1} \otimes G_{2}\right) \geq \min \left\{\delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right), \delta^{\prime}\left(G_{2}\right)+2 \delta\left(G_{1}\right)\right\}$. Note that $\left|V\left(G_{i}\right)\right| \geq 4$ for each $i$ because $\lambda^{\prime}\left(G_{i}\right)$ is defined. Let $E$ be a restricted edge cutset of $G_{1} \otimes G_{2}$. We may assume that $E$ is a minimal edge cutset. By Lemma 2.4,

$$
|E| \geq \min \left\{\left|V\left(G_{1}\right)\right| \lambda\left(G_{2}\right),\left|V\left(G_{2}\right)\right| \lambda\left(G_{1}\right), \lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right), \lambda^{\prime}\left(G_{2}\right)+2 \lambda\left(G_{1}\right)\right\}
$$

On the other hand, since $\left|V\left(G_{1}\right)\right|>2$ and $\lambda\left(G_{2}\right) \geq 2$, it follows from Lemma 2.2 that,

$$
\left|V\left(G_{1}\right)\right| \lambda\left(G_{2}\right) \geq 2\left|V\left(G_{1}\right)\right|+2 \lambda\left(G_{2}\right)-4 \geq \lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right) .
$$

Similarly $\left|V\left(G_{2}\right)\right| \lambda\left(G_{1}\right) \geq \lambda^{\prime}\left(G_{2}\right)+2 \lambda\left(G_{1}\right)$. Since $\lambda\left(G_{i}\right)=\delta\left(G_{i}\right)$ and $\lambda^{\prime}\left(G_{i}\right)=$ $\delta^{\prime}\left(G_{i}\right)$ for each $i$ by assumption, it follows that

$$
\begin{aligned}
|E| & \geq \min \left\{\lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right), \lambda^{\prime}\left(G_{2}\right)+2 \lambda\left(G_{1}\right)\right\} \\
& =\min \left\{\delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right), \delta^{\prime}\left(G_{2}\right)+2 \delta\left(G_{1}\right)\right\} .
\end{aligned}
$$

Since $E$ is an arbitrary restricted edge cutset, we get

$$
\lambda^{\prime}\left(G_{1} \otimes G_{2}\right) \geq \min \left\{\delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right), \delta^{\prime}\left(G_{2}\right)+2 \delta\left(G_{1}\right)\right\}
$$

Combining this with the inequalities proved in the first paragraph, we obtain

$$
\lambda^{\prime}\left(G_{1} \otimes G_{2}\right)=\delta^{\prime}\left(G_{1} \otimes G_{2}\right)=\min \left\{\delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right), \delta^{\prime}\left(G_{2}\right)+2 \delta\left(G_{1}\right)\right\}
$$

We now prove the last assertion of the theorem. Suppose that $G_{1} \otimes G_{2}$ is not super restricted edge connected. and let $E$ be a restricted edge cutset with $|E|=\min \left\{\delta^{\prime}\left(G_{1}\right)+2 \delta\left(G_{2}\right), \delta^{\prime}\left(G_{2}\right)+2 \delta\left(G_{1}\right)\right\}$ such that $\left(G_{1} \otimes G_{2}\right)-E$ has no component of order 2. From Lemma 2.4, we see that (i) of Lemma 2.4 holds. By the calculations in the preceding paragraph, we have either $\left|V\left(G_{1}\right)\right| \lambda\left(G_{2}\right)=2\left|V\left(G_{1}\right)\right|+2 \lambda\left(G_{2}\right)-4=\lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right)$ or $\left|V\left(G_{2}\right)\right| \lambda\left(G_{1}\right)=$ $2\left|V\left(G_{2}\right)\right|+2 \lambda\left(G_{1}\right)-4=\lambda^{\prime}\left(G_{2}\right)+2 \lambda\left(G_{1}\right)$. If $\left|V\left(G_{1}\right)\right| \lambda\left(G_{2}\right)=2\left|V\left(G_{1}\right)\right|+$ $2 \lambda\left(G_{2}\right)-4=\lambda^{\prime}\left(G_{1}\right)+2 \lambda\left(G_{2}\right)$, then since $\left|V\left(G_{1}\right)\right|>2$, it follows from the first equality that $\lambda\left(G_{2}\right)=2$, and it follows from the second equality and Lemma 2.2 that $G_{1}$ is a complete graph. Similarly if $\left|V\left(G_{2}\right)\right| \lambda\left(G_{1}\right)=2\left|V\left(G_{2}\right)\right|+$ $2 \lambda\left(G_{1}\right)-4=\lambda^{\prime}\left(G_{2}\right)+2 \lambda\left(G_{1}\right)$, then $\lambda\left(G_{1}\right)=2$ and $G_{2}$ is a complete graph. This proves the last assertion, and completes the proof of Theorem 1.3.

## §4. Corollaries

In this section, we prove corollaries of Theorem 1.2 and Theorem 1.3 (note that Proposition 1.1 follows immediately from these corollaries).

Corollary 4.1. Let $n \geq 2$. Let $G_{1}, G_{2}, \ldots, G_{n}$ be graphs, and suppose that $\lambda\left(G_{i}\right)=\delta\left(G_{i}\right) \geq 1$ for each $1 \leq i \leq n$. Then

$$
\lambda\left(G_{1} \otimes \cdots \otimes G_{n}\right)=\delta\left(G_{1} \otimes \cdots \otimes G_{n}\right)=\sum_{1 \leq i \leq n} \delta\left(G_{i}\right)
$$

Furthermore, unless $n=2$ and either $G_{1}$ is a complete graph and $\delta\left(G_{2}\right)=1$ or $G_{2}$ is a complete graph and $\delta\left(G_{1}\right)=1, G_{1} \otimes \cdots \otimes G_{n}$ is super edge connected.

Proof. We proceed by induction on $n$. If $n=2$, then the desired conclusion follows from Theorem 1.2. Thus let $n \geq 3$ and assume that the proposition holds for $n-1$. Then $\lambda\left(G_{1} \otimes \cdots \otimes G_{n-1}\right)=\delta\left(G_{1} \otimes \cdots \otimes G_{n-1}\right)=\sum_{1 \leq i \leq n-1} \delta\left(G_{i}\right)$. Hence

$$
\begin{aligned}
\lambda\left(G_{1} \otimes \cdots \otimes G_{n}\right) & =\delta\left(G_{1} \otimes \cdots \otimes G_{n}\right) \\
& =\sum_{1 \leq i \leq n-1} \delta\left(G_{i}\right)+\delta\left(G_{n}\right) \\
& =\sum_{1 \leq i \leq n} \delta\left(G_{i}\right)
\end{aligned}
$$

by Theorem 1.2. Further $\delta\left(G_{1} \otimes \cdots \otimes G_{n-1}\right)=\sum_{1 \leq i \leq n-1} \delta\left(G_{i}\right)>1$ and $G_{1} \otimes$ $\cdots \otimes G_{n-1}$ is not a complete graph. Consequently $G_{1} \otimes \cdots \otimes G_{n}$ is super edge connected by Theorem 1.2.

Corollary 4.2. Let $n \geq 2$. Let $G_{1}, G_{2}, \ldots, G_{n}$ be graphs and suppose that $\lambda\left(G_{i}\right)=\delta\left(G_{i}\right) \geq 2$ and $\lambda^{\prime}\left(G_{i}\right)=\delta^{\prime}\left(G_{i}\right) \geq 2$ for each $1 \leq i \leq n$. Then

$$
\lambda^{\prime}\left(G_{1} \otimes \cdots \otimes G_{n}\right)=\delta^{\prime}\left(G_{1} \otimes \cdots \otimes G_{n}\right)=\min _{1 \leq j \leq n}\left(\delta^{\prime}\left(G_{j}\right)+2 \sum_{\substack{1 \leq i \leq n \\ i \neq j}} \delta\left(G_{i}\right)\right) .
$$

Furthermore, unless $n=2$ and either $G_{1}$ is a complete graph and $\delta\left(G_{2}\right)=2$ or $G_{2}$ is a complete graph and $\delta\left(G_{1}\right)=2, G_{1} \otimes \cdots \otimes G_{n}$ is super restricted edge connected.
Proof. We proceed by induction on $n$. If $n=2$, then the desired conclusion follows from Theorem 1.3. Thus let $n \geq 3$ and assume that the proposition holds for $n-1$. Then

$$
\begin{aligned}
\lambda\left(G_{1} \otimes \cdots \otimes G_{n-1}\right) & =\delta\left(G_{1} \otimes \cdots \otimes G_{n-1}\right) \\
& =\min _{1 \leq j \leq n-1}\left(\delta^{\prime}\left(G_{j}\right)+2 \sum_{\substack{1 \leq i \leq n-1 \\
i \neq j}} \delta\left(G_{i}\right)\right)
\end{aligned}
$$

Hence

$$
\begin{aligned}
\lambda^{\prime}\left(G_{1} \otimes \cdots \otimes G_{n}\right)= & \delta^{\prime}\left(G_{1} \otimes \cdots \otimes G_{n}\right) \\
= & \min \left\{\delta^{\prime}\left(G_{1} \otimes \cdots \otimes G_{n-1}\right)+2 \delta\left(G_{n}\right),\right. \\
& \left.\delta^{\prime}\left(G_{n}\right)+2 \delta\left(G_{1} \otimes \cdots \otimes G_{n-1}\right)\right\} \\
= & \min \left\{\min _{1 \leq j \leq n-1}\left(\delta^{\prime}\left(G_{j}\right)+2 \sum_{\substack{1 \leq i \leq n-1 \\
i \neq j}} \delta\left(G_{i}\right)\right)+2 \delta\left(G_{n}\right),\right. \\
& \left.\delta^{\prime}\left(G_{n}\right)+2 \sum_{1 \leq i \leq n-1} \delta\left(G_{i}\right)\right\} \\
= & \min _{1 \leq j \leq n}\left(\delta^{\prime}\left(G_{j}\right)+2 \sum_{\substack{1 \leq i \leq n \\
i \neq j}} \delta\left(G_{i}\right)\right) .
\end{aligned}
$$

by Theorem 1.3 and Corollary 4.1. Further

$$
\delta\left(G_{1} \otimes \cdots \otimes G_{n-1}\right)=\sum_{1 \leq i \leq n-1} \delta\left(G_{i}\right)>2
$$

and $G_{1} \otimes \cdots \otimes G_{n-1}$ is not a complete graph. Consequently $G_{1} \otimes \cdots \otimes G_{n}$ is super restricted edge connected by Theorem 1.3. This proves Corollary 4.2.
