

RIEMANNIAN MANIFOLDS ADMITTING A PROJECTIVE VECTOR FIELD

BY HITOSI HIRAMATU

§ 1. Introduction.

Let M be a connected Riemannian manifold of dimension n covered by a system of coordinate neighborhoods $\{U; x^h\}$, where, here and in the sequel, the indices h, i, j, k, \dots run over the range $\{1, 2, \dots, n\}$ and let $g_{ji}, \{^h_i\}, \nabla_j, K_{kji}{}^h, K_{ji}$ and K be respectively the metric tensor, the Christoffel symbols formed with g_{ji} , the operator of covariant differentiation with respect to $\{^h_i\}$, the curvature tensor, the Ricci tensor and the scalar curvature of M .

A vector field v^h on M is called a projective vector field if it satisfies

$$(1.1) \quad L_v \{^h_i\} = \nabla_j \nabla_i v^h + v^k K_{kji}{}^h = \delta_j^h \rho_i + \delta_i^h \rho_j$$

for a certain covariant vector field ρ_i , called the associated covariant vector field of v^h , where L_v denotes the operator of Lie derivation with respect to the vector field v^h . In particular, if ρ_i in (1.1) is zero vector field then the projective vector field v^h is called an affine vector field. When we refer in the sequel to a projective vector field v^h , we always mean by ρ_i the associated covariant vector field appearing in (1.1).

Recently, the present author [1, 2] proved a series of integral inequalities in a compact and orientable Riemannian manifold with constant scalar curvature admitting a projective vector field and then obtained necessary and sufficient conditions for such a Riemannian manifold to be isometric to a sphere.

The purpose of the present paper is to continue the work of the present author [1, 2] and to prove the following theorem.

THEOREM A. *If a connected, compact, orientable and simply connected Riemannian manifold M with constant scalar curvature K of dimension $n > 1$ admits a non-affine projective vector field v^h , then M is globally isometric to a sphere of radius $\sqrt{n(n-1)/K}$ in the Euclidean $(n+1)$ -space.*

In the sequel, we need the following theorem due to Obata [3]. (See also [4].)

THEOREM B. *Let M be a complete, connected and simply connected Riemannian*

Received July 25, 1979

nian manifold. In order for M to admit a non-trivial solution φ of a system of partial differential equations

$$(1.2) \quad \nabla_j \nabla_i \varphi_h + k(2\varphi_j g_{ih} + \varphi_i g_{jh} + \varphi_h g_{ji}) = 0,$$

where $\varphi_h = \nabla_h \varphi$, k being a positive constant, it is necessary and sufficient that M is globally isometric to a sphere of radius $1/\sqrt{k}$ in the Euclidean $(n+1)$ -space.

We assume in this paper that Riemannian manifolds under consideration are connected.

§ 2. Preliminaries.

We consider a projective vector field v^h on a Riemannian manifold M of dimension n . From (1.1), we have easily

$$(2.1) \quad \nabla_j \nabla_i v^t = (n+1)\rho_j$$

and

$$(2.2) \quad \nabla^j \nabla_j v^i + K_j^i v^j = 2\rho^i,$$

where $\nabla^j = g^{ji} \nabla_i$ and $\rho^i = g^{ih} \rho_h$. (2.1) shows that the associated covariant vector field ρ_j is gradient. Putting

$$(2.3) \quad \rho = \frac{1}{n+1} \nabla_i v^i,$$

we have

$$(2.4) \quad \rho_j = \nabla_j \rho.$$

We have, from (1.1),

$$(2.5) \quad \nabla_j (\nabla_i v_h + \nabla_h v_i) = 2\rho_j g_{ih} + \rho_i g_{jh} + \rho_h g_{ji},$$

from which

$$(2.6) \quad \nabla_j L_v g^{ih} = -2\rho_j g^{ih} - \rho^i \delta_j^h - \rho^h \delta_j^i$$

and

$$(2.7) \quad \nabla^j L_v g^{ih} = -2\rho^j g^{ih} - \rho^i g^{jh} - \rho^h g^{ji},$$

where $v_h = v^i g_{ih}$.

Substituting (1.1) into the formula [5]

$$L_v K_{kji}{}^h = \nabla_k L_v \{j^h{}_i\} - \nabla_j L_v \{k^h{}_i\},$$

we find

$$(2.8) \quad L_v K_{kji}{}^h = -\delta_k^h \nabla_j \rho_i + \delta_j^h \nabla_k \rho_i,$$

from which

$$(2.9) \quad L_v K_{ji} = -(n-1) \nabla_j \rho_i.$$

We define a tensor field G_{ji} [1, 2] on M by

$$(2.10) \quad G_{ji} = K_{ji} - \frac{K}{n} g_{ji},$$

which satisfies

$$(2.11) \quad G_{ji} = G_{ij}, \quad G_{ji} g^{ji} = 0.$$

If $G_{ji} = 0$ for $n > 2$ then M is an Einstein manifold and K is a constant. The projective curvature tensor field $P_{kji}{}^h$ on M is defined by

$$(2.12) \quad P_{kji}{}^h = K_{kji}{}^h - \frac{1}{n-1} (\delta_k^h K_{ji} - \delta_j^h K_{ki}).$$

The tensor field $P_{kji}{}^h$ satisfies

$$(2.13) \quad P_{kji}{}^h = -P_{jki}{}^h,$$

$$(2.14) \quad P_{kji}{}^h + P_{ikj}{}^h + P_{jik}{}^h = 0,$$

$$(2.15) \quad P_{tji}{}^t = 0, \quad P_{kjt}{}^t = 0$$

and

$$(2.16) \quad P_{kji}{}^h g^{ji} = \frac{n}{n-1} G_{kh},$$

where $P_{kji}{}^h = P_{kji}{}^t g_{th}$.

It is known that if $n = 2$ then $P_{kji}{}^h = 0$ and if $P_{kji}{}^h = 0$ for $n > 2$ then M is projectively flat.

If the scalar curvature K is a constant, then, using

$$\nabla^j K_{ji} = \frac{1}{2} \nabla_i K = 0$$

and

$$\nabla_i K_{kji}{}^t = \nabla_k K_{ji} - \nabla_j K_{ki},$$

which can be obtained from the Bianchi identity

$$\nabla_l K_{kji}{}^h + \nabla_j K_{lki}{}^h + \nabla_k K_{jli}{}^h = 0,$$

we have

$$(2.17) \quad \nabla^k P_{kji}{}^h = \frac{n-2}{n-1} \nabla^h G_{ji} - \nabla_i G_j{}^h,$$

where $G_j^h = G_{ji} g^{ih}$.

For a projective vector field v^h on a Riemannian manifold M , we have, for the tensor field G_{ji} ,

$$(2.18) \quad L_v G_{ji} = -\nabla_j w_i - \nabla_i w_j,$$

if the scalar curvature K is a constant, where we have put

$$(2.19) \quad w^h = \frac{n-1}{2} \rho^h + \frac{K}{n} v^h$$

and $w_i = g_{ih} w^h$, and, for the projective curvature tensor field $P_{kji}{}^h$,

$$(2.20) \quad L_v P_{kji}{}^h = 0.$$

§ 3. Proof of Theorem A.

In this section, we prove Theorem A. For this purpose, we need a series of lemmas.

LEMMA 1. *In a compact and orientable Riemannian manifold M , we have*

$$(3.1) \quad \int_M (\nabla_i f)(\nabla^i h) dV = - \int_M f \Delta h dV = - \int_M h \Delta f dV$$

for any functions f and h on M , where $\Delta = g^{ji} \nabla_j \nabla_i$ and dV denotes the volume element of M .

Proof. This follows from

$$0 = \int_M \nabla_i (f \nabla^i h) dV = \int_M (\nabla_i f)(\nabla^i h) dV + \int_M f \Delta h dV$$

and

$$0 = \int_M \nabla_i (h \nabla^i f) dV = \int_M (\nabla_i h)(\nabla^i f) dV + \int_M h \Delta f dV.$$

LEMMA 2. *If, in a compact and orientable Riemannian manifold M , a non-constant function φ satisfies a system of partial differential equations*

$$(3.2) \quad \nabla_j \nabla_i \varphi_n + k(2\varphi_j g_{in} + \varphi_i g_{jn} + \varphi_n g_{ji}) = 0,$$

where $\varphi_n = \nabla_n \varphi$, k being a constant, then the constant k is necessarily positive.

Proof. Transvecting (3.2) with g^{in} , we have

$$\nabla_j \Delta \varphi + 2(n+1)k\varphi_j = 0,$$

from which and Lemma 1,

$$\begin{aligned}
 k \int_M \varphi_j \varphi^j dV &= -\frac{1}{2(n+1)} \int_M (\nabla_j \Delta \varphi) \varphi^j dV \\
 &= \frac{1}{2(n+1)} \int_M (\Delta \varphi)^2 dV,
 \end{aligned}$$

where $\varphi^j = g^{ji} \varphi_i$. Since φ is a non-constant function, two integral inequalities

$$\int_M \varphi_j \varphi^j dV > 0, \quad \int_M (\Delta \varphi)^2 dV > 0$$

hold and consequently k must be positive.

LEMMA 3. *If a complete and simply connected Riemannian manifold M with positive constant scalar curvature K of dimension $n > 1$ admits a non-affine projective vector field v^h and if the vector field w^h defined by (2.19) is a Killing vector field, then M is globally isometric to a sphere of radius $\sqrt{n(n-1)/K}$ in the Euclidean $(n+1)$ -space.*

Proof. We have, from (1.1),

$$\nabla_j (\nabla_i v_h + \nabla_h v_i) = 2\rho_j g_{ih} + \rho_i g_{jh} + \rho_h g_{ji}.$$

Since w^h is a Killing vector field, we have

$$\nabla_i w_h + \nabla_h w_i = 0$$

or, equivalently,

$$(n-1)\nabla_i \rho_h + \frac{K}{n} (\nabla_i v_h + \nabla_h v_i) = 0,$$

from which and the above relation, we find

$$\nabla_j \nabla_i \rho_h + \frac{K}{n(n-1)} (2\rho_j g_{ih} + \rho_i g_{jh} + \rho_h g_{ji}) = 0,$$

and consequently the lemma follows from Theorem B.

Remark. Using Lemma 2, we see that if, in Lemma 3, M is compact and orientable then we can remove the positiveness of the scalar curvature K .

LEMMA 4. *For a projective vector field v^h on a compact and orientable Riemannian manifold M with constant scalar curvature K of dimension $n > 1$, we have*

$$\begin{aligned}
 (3.3) \quad \int_M G_{ji} \rho^j w^i dV &= \frac{2}{n-1} \int_M (\Delta_i w^i)^2 dV \\
 &\quad - \frac{1}{2(n-1)} \int_M (\nabla_j w_i + \nabla_i w_j) (\nabla^j w^i + \nabla^i w^j) dV.
 \end{aligned}$$

Proof. By using an identity

$$\nabla^j \nabla_j \rho_i - K_{ji} \rho^j - \nabla_i \Delta \rho = 0,$$

we have

$$\int_{\mathcal{M}} G_{ji} \rho^j w^i dV = - \int_{\mathcal{M}} (\nabla_i \Delta \rho) w^i dV + \int_{\mathcal{M}} (\nabla^j \nabla_j \rho_i) w^i dV - \frac{K}{n} \int_{\mathcal{M}} \rho_i w^i dV.$$

Here we notice that we have, using (2.1) and (2.19),

$$\begin{aligned} - \int_{\mathcal{M}} (\nabla_i \Delta \rho) w^i dV &= \int_{\mathcal{M}} (\Delta \rho) \nabla_i w^i dV \\ &= \int_{\mathcal{M}} \left[\nabla_t \left\{ \frac{2}{n-1} w^t - \frac{2K}{n(n-1)} v^t \right\} \right] \nabla_i w^i dV \\ &= \frac{2}{n-1} \int_{\mathcal{M}} (\nabla_i w^t)^2 dV - \frac{2K}{n(n-1)} \int_{\mathcal{M}} (\nabla_t v^t) \nabla_i w^i dV \\ &= \frac{2}{n-1} \int_{\mathcal{M}} (\nabla_i w^t)^2 dV + \frac{2K}{n(n-1)} \int_{\mathcal{M}} (\nabla_i \nabla_t v^t) w^i dV \\ &= \frac{2}{n-1} \int_{\mathcal{M}} (\nabla_i w^t)^2 dV + \frac{2(n+1)K}{n(n-1)} \int_{\mathcal{M}} \rho_i w^i dV. \end{aligned}$$

Consequently, we have

$$\begin{aligned} \int_{\mathcal{M}} G_{ji} \rho^j w^i dV &= \frac{2}{n-1} \int_{\mathcal{M}} (\nabla_i w^t)^2 dV + \int_{\mathcal{M}} (\nabla^j \nabla_j \rho_i) w^i dV + \frac{(n+3)K}{n(n-1)} \int_{\mathcal{M}} \rho_i w^i dV, \end{aligned}$$

from which, using

$$\nabla^j (\nabla_j v_i + \nabla_i v_j) = \nabla^j L_{0j} g_{ji} = (n+3) \rho_i,$$

$$\begin{aligned} \int_{\mathcal{M}} G_{ji} \rho^j w^i dV &= \frac{2}{n-1} \int_{\mathcal{M}} (\nabla_i w^t)^2 dV \\ &\quad + \frac{1}{n-1} \int_{\mathcal{M}} \left[\nabla^j \left\{ \nabla_j \left(\frac{n-1}{2} \rho_i + \frac{K}{n} v_i \right) + \nabla_i \left(\frac{n-1}{2} \rho_j + \frac{K}{n} v_j \right) \right\} \right] w^i dV \\ &= \frac{2}{n-1} \int_{\mathcal{M}} (\nabla_i w^t)^2 dV + \frac{1}{n-1} \int_{\mathcal{M}} \{ \nabla^j (\nabla_j w_i + \nabla_i w_j) \} w^i dV \\ &= \frac{2}{n-1} \int_{\mathcal{M}} (\nabla_i w^t)^2 dV - \frac{1}{n-1} \int_{\mathcal{M}} (\nabla_j w_i + \nabla_i w_j) \nabla^j w^i dV \\ &= \frac{2}{n-1} \int_{\mathcal{M}} (\nabla_i w^t)^2 dV - \frac{1}{2(n-1)} \int_{\mathcal{M}} (\nabla_j w_i + \nabla_i w_j) (\nabla^j w^i + \nabla^i w^j) dV. \end{aligned}$$

LEMMA 5. For a projective vector field v^h on a compact and orientable Riemannian manifold M with constant scalar curvature K , we have

$$(3.4) \quad \int_M (\nabla^j L_v G_{ji}) w^i dV = \frac{1}{2} \int_M (\nabla_j w_i + \nabla_i w_j) (\nabla^j w^i + \nabla^i w^j) dV.$$

Proof. Integrating

$$\begin{aligned} & \nabla^j \{(\nabla_j w_i + \nabla_i w_j) w^i\} \\ &= \{\nabla^j (\nabla_j w_i + \nabla_i w_j)\} w^i + (\nabla_j w_i + \nabla_i w_j) \nabla^j w^i \\ &= \{\nabla^j (\nabla_j w_i + \nabla_i w_j)\} w^i + \frac{1}{2} (\nabla_j w_i + \nabla_i w_j) (\nabla^j w^i + \nabla^i w^j) \end{aligned}$$

over M and using (2.18), we have (3.4).

LEMMA 6. For a projective vector field v^h on a compact and orientable Riemannian manifold M with constant scalar curvature K of dimension $n > 1$, we have

$$(3.5) \quad \begin{aligned} \int_M (\nabla^j L_v G_j^i) w_i dV &= -\frac{6}{n-1} \int_M (\nabla_i w^i)^2 dV \\ &+ \frac{n+2}{2(n-1)} \int_M (\nabla_j w_i + \nabla_i w_j) (\nabla^j w^i + \nabla^i w^j) dV. \end{aligned}$$

Proof. Using

$$\nabla^j G_{ji} = \frac{n-2}{2n} \nabla_i K = 0,$$

we have

$$\begin{aligned} (\nabla^j L_v G_j^i) w_i &= \{\nabla^j L_v (G_{jt} g^{ti})\} w_i \\ &= (\nabla^j L_v G_{ji}) w^i + G_{jt} (\nabla^j L_v g^{ti}) w_i. \end{aligned}$$

Substituting (2.7) into this, we find

$$(\nabla^j L_v G_j^i) w_i = (\nabla^j L_v G_{ji}) w^i - 3G_{ji} \rho^j w^i.$$

Integrating this over M and using Lemmas 4 and 5, we have (3.5).

LEMMA 7. For a projective vector field v^h on a compact and orientable Riemannian manifold M with constant scalar curvature K of dimension $n > 1$, we have

$$(3.6) \quad \begin{aligned} \int_M g^{kj} (L_v \nabla_k G_{ji}) w^i dV &= -\frac{6}{n-1} \int_M (\nabla_i w^i)^2 dV \\ &+ \frac{n+2}{2(n-1)} \int_M (\nabla_j w_i + \nabla_i w_j) (\nabla^j w^i + \nabla^i w^j) dV. \end{aligned}$$

Proof. We have

$$\begin{aligned} g^{kj}(L_v \nabla_k G_{ji}) w^i &= (\nabla^j L_v G_{ji}) w^i - g^{kj}(L_v \{^t_k{}^t_j\}) G_{ti} w^i - g^{kj}(L_v \{^t_k{}^t_i\}) G_{jt} w^i \\ &= (\nabla^j L_v G_{ji}) w^i - 3G_{ji} \rho^j w^i. \end{aligned}$$

Integrating this over M and using Lemmas 4 and 5, we have (3.6).

Now we prove Theorem A. By using

$$(L_v P_{kji}{}^h) g^{jt} = \frac{n}{n-1} L_v G_k{}^h - P_{kji}{}^h L_v g^{jt},$$

we have

$$\begin{aligned} (\nabla^k L_v P_{kji}{}^h) g^{jt} w_h &= \frac{n}{n-1} (\nabla^k L_v G_k{}^h) w_h \\ &\quad - (\nabla^k P_{kji}{}^h) (L_v g^{jt}) w_h - P_{kji}{}^h (\nabla^k L_v g^{jt}) w_h. \end{aligned}$$

Substituting (2.7) and (2.17) into this, we find

$$\begin{aligned} (\nabla^k L_v P_{kji}{}^h) g^{jt} w_h &= \frac{n}{n-1} (\nabla^k L_v G_k{}^h) w_h \\ &\quad - \frac{n-2}{n-1} (\nabla^h G_{ji}) (L_v g^{ji}) w_h + (\nabla_i G_j{}^h) (L_v g^{ji}) w_h + \frac{n}{n-1} G_{ji} \rho^j w^i, \end{aligned}$$

from which, integrating over M ,

$$\begin{aligned} &\int_M (\nabla^k L_v P_{kji}{}^h) g^{jt} w_h dV \\ &= \frac{n}{n-1} \int_M (\nabla^j L_v G_{ji}) w_i dV - \frac{n-2}{n-1} \int_M (\nabla_i G_{ji}) (L_v g^{ji}) w^i dV \\ &\quad + \int_M (\nabla_k G_{ji}) (L_v g^{kj}) w^i dV + \frac{n}{n-1} \int_M G_{ji} \rho^j w^i dV. \end{aligned}$$

Here we notice that we have, using (2.6) and (2.18),

$$\begin{aligned} &-\frac{n-2}{n-1} \int_M (\nabla_i G_{ji}) (L_v g^{ji}) w^i dV \\ &= \frac{n-2}{n-1} \int_M G_{ji} (\nabla_i L_v g^{ji}) w^i dV + \frac{n-2}{n-1} \int_M G_{ji} (L_v g^{ji}) \nabla_i w^i dV \\ &= -\frac{2(n-2)}{n-1} \int_M G_{ji} \rho^j w^i dV - \frac{n-2}{n-1} \int_M (L_v G_{ji}) g^{ji} \nabla_i w^i dV \\ &= -\frac{2(n-2)}{n-1} \int_M G_{ji} \rho^j w^i dV + \frac{2(n-2)}{n-1} \int_M (\nabla_i w^i)^2 dV \end{aligned}$$

and, using

$$(\nabla_k G_{ji})g^{kj} = -\frac{n-2}{2n}\nabla_i K = 0,$$

$$\int_M (\nabla_k G_{ji})(L_v g^{kj})w^i dV = -\int_M g^{kj}(L_v \nabla_k G_{ji})w^i dV.$$

Consequently, we have

$$\begin{aligned} & \int_M (\nabla^k L_v P_{kji}{}^h)g^{ji}w_h dV \\ &= \frac{2(n-2)}{n-1}\int_M (\nabla_i w^i)^2 dV - \frac{n-4}{n-1}\int_M G_{ji}\rho^j w^i dV \\ & \quad + \frac{n}{n-1}\int_M (\nabla^j L_v G_j{}^i)w_i dV - \int_M g^{kj}(L_v \nabla_k G_{ji})w^i dV, \end{aligned}$$

from which, using Lemmas 4, 6 and 7, we have

$$\begin{aligned} \int_M (\nabla^k L_v P_{kji}{}^h)g^{ji}w_h dV &= \frac{2(n-3)}{n-1}\int_M (\nabla_i w^i)^2 dV \\ & \quad + \frac{1}{n-1}\int_M (\nabla_j w_i + \nabla_i w_j)(\nabla^j w^i + \nabla^i w^j) dV. \end{aligned}$$

From this and (2.20), we have

$$\frac{2(n-3)}{n-1}\int_M (\nabla_i w^i)^2 dV + \frac{1}{n-1}\int_M (\nabla_j w_i + \nabla_i w_j)(\nabla^j w^i + \nabla^i w^j) dV = 0.$$

If $n > 2$ then we have, from the above relation,

$$\int_M (\nabla_j w_i + \nabla_i w_j)(\nabla^j w^i + \nabla^i w^j) dV = 0,$$

from which

$$\nabla_j w_i + \nabla_i w_j = 0,$$

that is, the vector field w^h defined by (2.19) is a Killing vector field and Theorem A follows from Lemma 3. If $n=2$ then we have $P_{kji}{}^h=0$ and hence, from (2.16), $G_{ji}=0$. Consequently, using Lemma 5, we have

$$\int_M (\nabla_j w_i + \nabla_i w_j)(\nabla^j w^i + \nabla^i w^j) dV = 0,$$

from which

$$\nabla_j w_i + \nabla_i w_j = 0$$

and Theorem A follows from Lemma 3.
