ERRATUM TO "COMPARING RIEMANNIAN FOLIATIONS WITH TRANSVERSALLY SYMMETRIC FOLIATIONS"

FRANZ W. KAMBER, ERNST A. RUH & PHILIPPE TONDEUR

As has been pointed out by Hebda [1], the main theorem of our paper [2] is not correct as stated. In the theorem on p. 461 the assumption "$\pi_1(K)$ finite, i.e., K semisimple" should be added. The averaging process for the developing map $\Phi \colon \widetilde{P} \to \widetilde{G}$ referred to in the second paragraph on p. 462 works under this assumption. All the arguments are valid for the foliation $\mathscr{F}$ lifted to the (K-reduction of the) normal frame bundle P of $\mathscr{F}$, for which we produce a Cartan connection with vanishing curvature. This implies that this lifted foliation is a Lie foliation. For this we refer to [3].
