

A NEW IDENTITY - II

K. RAMACHANDRA

Abstract: A new identity is proved. From this we deduce as corollaries: 2.1—an identity involving the Lionville's function $\lambda(n)$, 2.2—an identity involving the von-Mongoldt's function $\lambda(n)$ and 2.3—an identity involving the generating function of Waring's problem. Some other identities are also mentioned.

Keywords: Higher powers of partial sums, re-arrangement of series and identities involving infinite series.

1. The new identity

We start with the identity

$$bx^2 - (a + b)(x + a)^2 + a(x + a + b)^2 = ab(a + b) \quad (1.1)$$

and deduce our new identity (namely the theorem below). We then deduce some corollaries. Let $f(0), f(1), f(2), \dots$ be any sequence of complex numbers. Put

$$H_n = \sum_{m=0}^n f(m) \quad (1.2)$$

where $m(\geq 1)$ is any integer. In (1.1) set

$$x = H_n, \quad a = f(n + 1) \quad \text{and} \quad b = f(n + 2), \quad (1.3)$$

where $n(\geq 1)$ is a any integer. We obtain

$$\begin{aligned} f(n + 2)H_n^2 - (f(n + 1) + f(n + 2))H_{n+1}^2 + f(n + 1)H_{n+2}^2 \\ = f(n + 1)f(n + 2)(f(n + 1) + f(n + 2)). \end{aligned} \quad (1.4)$$

From this we deduce

$$\begin{aligned} \sum_{n=1}^{\infty} f(n+2)H_n^2 - \sum_{n=1}^{\infty} (f(n+1) + f(n+2))H_{n+1}^2 + \sum_{n=1}^{\infty} f(n+1)H_{n+2}^2 \\ = \sum_{n=1}^{\infty} f(n+1)f(n+2)(f(n+1) + f(n+2)) \end{aligned} \tag{1.5}$$

subject to the convergence of the infinite series involved. Here the LHS is

$$\begin{aligned} \sum_{n=3}^{\infty} f(n+2)H_n^2 + f(3)H_1^2 + f(4)H_2^2 - \sum_{n=3}^{\infty} (f(n) + f(n+1))H_n^2 \\ - (f(2) + f(3))H_2^2 + \sum_{n=3}^{\infty} f(n-1)H_n^2. \end{aligned}$$

Hence we obtain the following Theorem.

Theorem 1.1. We have

$$\begin{aligned} \sum_{n=3}^{\infty} (f(n-1) - f(n) - f(n+1) + f(n+2))H_n^2 \\ = \sum_{n=1}^{\infty} f(n+1)f(n+2)(f(n+1) + f(n+2)) - f(3)(f(0) + f(1))^2 \\ + (f(2) + f(3) - f(4))(f(0) + f(1) + f(2))^2 \end{aligned} \tag{1.6}$$

provided the two infinite series involved are convergent. Here as stated already

$$H_n = \sum_{m=0}^n f(m) \quad \text{for } n \geq 1.$$

2. Corollaries

Let $\lambda(n)$ be the Liouville's function defined by

$$\sum_{n=1}^{\infty} \frac{\lambda(n)}{n^s} = \prod_p (1 + p^{-s})^{-1} = \frac{\zeta(2s)}{\zeta(s)} \tag{2.1}$$

where the product is over all primes and $s = \sigma + it$, $\sigma \geq 2$. Putting $f(0) = 0$ and $f(n) = \lambda(n)n^{-1}$ we have

Corollary 2.1.

$$\begin{aligned} \sum_{n=3}^{\infty} \left(\frac{\lambda(n-1)}{n-1} - \frac{\lambda(n)}{n} - \frac{\lambda(n+1)}{n+1} + \frac{\lambda(n+2)}{n+2} \right) \left(\sum_{m=1}^n \frac{\lambda(m)}{m} \right)^2 \\ = \sum_{n=1}^{\infty} \frac{1}{(n+1)(n+2)} \left(\frac{\lambda(n+2)}{n+1} + \frac{\lambda(n+1)}{n+2} \right) + \frac{1}{16}. \end{aligned}$$

Remark. The series $\sum_{n=1}^{\infty} (\lambda(n)n^{-1})$ is convergent and is equal to zero. Also $|\sum_{m=1}^n \lambda(m)/m| \leq K/(\log n)^2 (n \geq 2)$ where K is a constant.

Let $\wedge(n)$ be the von-Mongoldt function defined

$$\sum_{n=1}^{\infty} \frac{\wedge(n)}{n^s} = -\frac{\zeta'(s)}{\zeta(s)}. \tag{2.2}$$

Putting $f(0) = 0$ and $f(n) = \wedge(n)z^n (n \geq 1)$, where z is a complex number with $|z| < 1$, we have

Corollary 2.2.

$$\begin{aligned} \sum_{n=3}^{\infty} (\wedge(n-1)z^{n-1} - \wedge(n)z^n - \wedge(n+1)z^{n+1} + \wedge(n+2)z^{n+2}) \left(\sum_{m=1}^n \wedge(m)z^m \right)^2 \\ = \sum_{n=1}^{\infty} \wedge(n+1) \wedge(n+2) z^{2n+3} (\wedge(n+1)z^{n+1} + \wedge(n+2)z^{n+2}) \\ - (\log 2)^2 z^4 ((\log 2)z^2 + (\log 3)z^3). \end{aligned} \tag{2.3}$$

Let $k(\geq 1)$ be any integer and z as before. Putting $f(0) = 0$ and $f(n) = z^{nk}$ we obtain

Corollary 2.3.

$$\begin{aligned} \sum_{n=3}^{\infty} (z^{(n-1)k} - z^{nk} - z^{(n+1)k} + z^{(n+2)k}) \left(\sum_{m=1}^n z^{mk} \right)^2 \\ = \sum_{n=1}^{\infty} z^{(n+1)k+(n+2)k} (z^{(n+1)k} + z^{(n+2)k}) - z^{3k+2} \\ + (z^{2k} + z^{3k} - z^{4k})(z + z^{2k})^2 \end{aligned} \tag{2.4}$$

Remark. We can go on listing some more corollaries. (For example we can take $f(0) = \zeta(3)$ and $f(n) = -1/n^3$ or $f(0) = \zeta(5)$ and $f(n) = -1/n^5$ and so on). But we stop at these three corollaries.

3. Higher powers of H_n

The identity (1.1) is a special case of the following result (see Theorem 1 of [1]). Let $k(\geq 1)$ be any integer and x, x_1, x_2, \dots, x_k any $k + 1$ non-zero complex numbers no two of which are equal. Then (plainly x can be zero).

$$x^k + \left\{ \sum_{m=1}^k (x + x_m)^k (-1)^m x_m^{-1} \left(\prod_{m>j\geq 1} (x_m - x_j)^{-1} \right) \left(\prod_{k\geq j>m} (x_j - x_m)^{-1} \right) \right\} \\ \times x_1 x_2 \dots x_k \\ = (-1)^k x_1 x_2 \dots x_k.$$

Using this we can get the analogue of our theorem above with H_n replaced by H_n^k . (Here k should not be confused with that in Corollary 2.3 above).
