Book Review

- Review of *Lectures on the Coupling Method* by Torgny Lindvall NEIL O'CONNELL

Higher Order Asymptotics
by Jayanta K. Ghosh

These lecture notes are concerned with Edgeworth expansions, higher order efficiency, expansion of posterior, probability matching priors and related topics. The lectures were originally presented at the NSF-CBMS Regional Conference held at Chapel Hill, North Carolina, in August 1991.

Contents

Introduction

Edgeworth Expansions, Curved Exponentials, and Fisher Consistent Estimates

Third Order Efficiency for Curved Exponentials

Curvature and Information Loss

Expansion of Posterior, Bayes Estimate and Bayes Risk

Third Order Efficiency, Admissibility, and Minimavity

Small Sample Efficiency

Magic Formula, Bartlett Correction, and Matching Probabilities

Noninformative Priors

The New Likelihoods and the Neyman-Scott Problems

Bibliography

Pages viii+110

IMS Lecture Notes—Monograph Series

Volume 23

CHANGE-POINT PROBLEMS

edited by E. Carlstein, H. G. Mueller and D. Segmund

Change-point analysis is a rapidly growing area with applications ranging from edge detection in image analysis to DNA sequence comparison to clinical trials and industrial quality control. Based on the AMS-IMS-SIAM Summer Research Conference on "Change-point Problems" at Mount Holyoke College, this volume contains 28 papers covering a wide range of change-point problems and theory.

385 pages; list price \$45; IMS members \$26

Volume 24

MULTIVARIATE ANALYSIS AND ITS APPLICATIONS

edited by T. W. Anderson, K. T. Fang and I. Olkin

This volume, based on an International Symposium held at Hong Kong Baptist College in 1992, presents work of many major figures in the theory of Multivariate Analysis and highlights important recent trends in applications. The volume includes 35 research articles and four longer articles summarizing short courses by T. W. Anderson, W. S. Cleveland, I. Olkin and Y.L. Tong, readers will find useful discussions of recent theoretical results in optimality, characterization and majorization. Applied topics include correspondence analysis, nonparametric regression, projection pursuit, structural equations and quantization.

472 pages; list price \$45; IMS members \$26

Volume 25

ADAPTIVE DESIGNS

edited by Nancy Flournoy and William F. Rosenberger

Because of the logic of adapting treatment allocation rules to the results of past experience, scientists and engineers repeatedly create and implement such strategies. Motivated by the desire to improve the efficiency of information acquisition or to limit exposure when the consequences of such exposure become evident, adaptive designs have a long history of popularity in practice. Advances in computational capabilities and in statistical theory for dependent observations have contributed to a resurgence of theoretical development in this area. This volume contains 20 papers whose topics include two-arm clinical trials, adaptive dose-response designs for quantile estimation and maximizing survival in the presence of opposing hazard functions, linear models, multinomial models, quality control and group testing.

296 pages; list price \$40; IMS members \$24
