Cloth \$89.95 ISBN 3-11-014030-6

Paper \$54.95 ISBN 3-11-013863-8

This graduate-level textbook provides an introduction to the essential parts of the theory of estimation and hypothesis testing for parametric models. Starting from basic concepts like sufficiency, completeness, monotony of likelihood ratios, and invariance, the text covers exact as well as asymptotic theory. Emphasis is on theoretical results, including a thorough discussion of optimality concepts for estimators and confidence procedures. Applications are illustrated by numerous examples and exercises.

The material in this book was compiled by the author from courses he has given over many years at the University of Cologne. Prerequisites are basic knowledge of measurement and probability theory.

Was This The Last Time You Bought Insurance?

Face it — it's been a long time. A lot has changed since then. Your family. Maybe your job. And more than likely, the amount of insurance coverage you need. That's why you need insurance that can easily adapt to the way your life changes — IMS Term Life Insurance.

We Understand You.

Finding insurance that's right for you can be difficult and time consuming. But we've done the work for you. Through our research, we've found a Term Life Plan designed to help members of our profession provide for the future of their families. What's more, with insurance purchased through IMS, you can be sure that the plan is constantly being evaluated to better meet the needs of our members.

We're Flexible.

Updating your insurance doesn't have to be a hassle. With

our Term Life Plan, as your needs change, so can your coverage. Insurance through your association is designed to grow with you — it even moves with you when you change jobs.

We're Affordable.

What good would all these benefits be if no one could afford them? That's why we offer our members the additional benefit of reasonable rates, negotiated using our group purchasing power. MULTIVARIATE ANALYSIS AND ITS APPLICATIONS

edited by T. W. Anderson, K. T. Fang and I. Olkin

This volume, based on an International Symposium held at Hong Kong Baptist College in 1992, presents work of many major figures in the theory of Multivariate Analysis and highlights important recent trends in applications. The volume includes 35 research articles and four longer articles summarizing short courses by T. W. Anderson, W. S. Cleveland, I. Olkin and Y.L. Tong, readers will find useful discussions of recent theoretical results in optimality, characterization and majorization. Applied topics include correspondence analysis, nonparametric regression, projection pursuit, structural equations and quantization.
