SOME NOTES ON THE THEORY OF HOLOMORPHIC CURVES

JUNJI SUZUKI AND NOBUSHIGE TODA

§ **1. Introduction**

In this paper, we shall give some notes on the order functions of holomorphic curves and, applying these facts, we may formulate the theory of holomorphic curves more precisely than those in Ahlfors [2], Cowen and Griffiths [4], Weyl [7] or Wu [8] in several cases.

Let $x: |z| < R \rightarrow P^{\pi}(C)$ ($n \ge 1, 0 < R \le \infty$) be a non-degenerate holomorphic curve and x^p be the associated curve of rank p of x ($p = 1, \dots,$ $n; x^1 = x$.

Let

$$
X=(x_{\scriptscriptstyle 1}(z),\,\cdot\cdot\cdot\,,\,x_{{\scriptscriptstyle n+1}}(z))
$$

be a reduced representation of x where x_1, \dots, x_{n+1} are holomorphic func tions in $|z|$ $\lt R$ without common zero for all and

$$
X^p=[X,dX/dz,\,\cdots,\,d^{p-1}X/dz^{p-1}]\qquad (p=1,\,\cdots,\,n)
$$

the osculating *p*-element of $X(X^1 = X)$ (see Weyl [7]), which is a repres entation of x^p . Let $T_p(r)$ be the order function of x^p $(p = 1, \dots, n)$. Then it is known that

(1)
$$
V_p(r) + \{T_{p+1}(r) - 2T_p(r) + T_{p-1}(r)\} = \Omega_p(r) - \Omega_p(r_o)
$$
 $(r_o \le r < R)$

where r_o is a fixed positive number, $V_p(r)$ is the valence in $|z| < r$ of the stationary points of rank *p* of *x* and

$$
\Omega_p(r) = \frac{1}{2\pi} \int_0^{2\pi} \log |X^{p+1}| |X^{p-1}| |X^p|^2 d\theta \qquad (z = re^{i\theta})
$$

(Weyl [71, p. 123).

In the theory of holomorphic curves, it is essential to evaluate Ω_p in terms of *T^p .* For example,

"When $R = \infty$, for any number $\alpha > 1$, the inequality

Received June 15, 1979.

$$
2\Omega_p(r) \leq \alpha \log T_p(r) - 2\log r + O(1)
$$

holds except for r of an open set $E \subset [r_o,\infty)$ such that

$$
\int_E r^{-1} dr < \infty
$$

(See Weyl [7], Chapter III.)

There is a similar result for $R < \infty$ (Weyl [7], Chapter IV).

We note that, in this paper, we always use $r = |z|$ as the independent variable instead of $\log r$. (cf. Weyl [7], Wu [8].)

In the proof of the defect relations for holomorphic curves, this esti mate of Ω _{*p*} plays a fundamental role and necessarily it comes out excep tional sets in many inequalities of which we are in need to prove the defect relations. (See Ahlfors [2], Weyl [7] etc.)

On the other hand, in the Nevanlinna theory of meromorphic func tions in $|z|$ $\lt R$ (Hayman [5], Nevanlinna [6]), the second fundamental theorem tells us that, for a non-constant meromorphic function $f(z)$ in $|z| < R$, the exceptional set does not come out if the order of f is finite and the defect relation holds either

(I) for any non-constant meromorphic function when $R = \infty$, or

(II) for any meromorphic function f such that

$$
\limsup_{r\to R} T(r,f)/\!\log(R-r)^{-1}=\infty
$$

when $R < \infty$.

For the systems of holomorphic functions in $|z| < R$, similar results are known (Cartan [3]).

In this paper, after the model of the case of meromorphic functions stated above, we shall remove the exceptional sets in the case of holo morphic curves applying the method used in Ahlfors [1] when $T_i(r)$ is of finite order and weaken "the hypothesis H " (Weyl [7], p. 201) in the case of $R < \infty$.

We will use the notation used in Weyl [7] in the main.

§ 2. Lemmas

We prepare some lemmas for later use.

 $\textbf{LEMMA 1.}$ *Let* $f(r)$ *be a function defined on* $[r_o, R)$ *with continuous* $\mathit{non-negative}$ derivative and $f(r_o) \geqq 1$. Then for any numbers $\alpha > 1$ and $\mu\geqq 0$,

(I) when $R = \infty$, the inequality

$$
f'(r)\leq \{f(r)\}^{\alpha}r^{\mu-1}
$$

 $holds\,\,except\,\,in\,\,an\,\,open\,\,set\,\,E\subset [r_o,\,\infty)\,\,such\,\,that\,\,% \label{eq:ex}$

$$
\int_E r^{\mu-1} dr \leq (\alpha-1)^{-1} ;
$$

(II) when $R < \infty$, the inequality

$$
f'(r)\leq \{f(r)\}^{\alpha}(R-r)^{-\mu-1}
$$

holds except in an open set $E \subset [r_o, R)$ such tha

$$
\int_E (R-r)^{-\mu-1} dr \leq (\alpha-1)^{-1} .
$$

(See *Weyl* (7] p. 155 *and* p. 197.)

LEMMA 2. Let two functions $f(r)$ and $F(r)$ be given on $[r_o, R)$ $(r_o > 0)$ *such that f(r) is continuous and*

$$
1+\log{(r/r_{o})}+\int_{r_{o}}^{r}\{(\log{r}-\log{t})\exp{(f(t))}\}/tdt\leq F(r) \qquad (r_{o}\leq r<_{1}^{r}R)\;.
$$

Then, for any numbers $\alpha > 1$ *and* $\mu \geq 0$, (I) when $R = \infty$,

$$
f(r) \leq \alpha^2 \log F(r) + \mu(\alpha + 1) \log r
$$

for all $r \geqq r_{\circ}$ except in an open set $E \subset [r_{\circ}, \infty)$ such that

$$
\int_E r^{\mu-1} dr \leq 2(\alpha-1)^{-1} ;
$$

(II) when $R < \infty$,

 $f(r) \leqq \alpha^2 \log F(r) + (\mu + 1)(\alpha + 1) \log (R - r)^{-1} + (\alpha + 1) \log r$

for all r in $[r_o, R)$ except in an open set $E \subset [r_o, R)$ such that

$$
\int_E (R-r)^{-\mu-1} dr \leq 2(\alpha-1)^{-1} .
$$

We may prove this lemma as in Weyl [7], p. 156 or p. 197 using Lemma 1.

DEFINITION. We say that a holomorphic curve x in $|z| < R$ is admissible if either $R = \infty$ and x is non-degenerate, or if $R < \infty$, x is nondegenerate and the following condition holds:

(2)
$$
\lim_{r \to R} T_p(r) = \infty \qquad (p = 1, \cdots, n).
$$

Note that, if $R = \infty$ and x is non-degenerate, the condition (2) holds. (See Weyl [7].)

LEMMA 3. For any admissible curve x in $|z| < R$, the following in*equality holds for all r in* $[R_o, R)$ $(r_o \leq R_o)$ *:*

$$
1+\log{(r/r_{o})}+\int_{r_{o}}^{r}\lbrace (\log{r}-\log{t})\exp{(2\tilde{\Omega}_{p}(t))}\rbrace/dt\leq2T_{p}(r)
$$

 $where \,\,\,\tilde{\varOmega}_p(t) = \varOmega_p(t) + \log{(t/r_o)} \,\,\, and \,\,\, R_o \,\,\, depends \,\,\, on \,\,\, the \,\,\,curvearrows.$ (See Weyl [71, p. 154 and p. 196.)

From now on in § 2 and § 3, we assume that all curves in our mind are admissible.

Applying Lemmas 1 and 2 to our curves, we obtain the following by Lemma 3.

PROPOSITION 1. For any numbers $\alpha > 1$ and $\mu \ge 0$, (I) when $R = \infty$, the inequality

$$
2\tilde{\Omega}_p(r) \leqq \alpha^2 \log T_p(r) + \mu(\alpha+1) \log r + O(1)
$$

 h olds for all $r\geq R$ ₀ except in an open set $E\subset [R$ ₀, $\infty)$ such that

$$
\int_E r^{\mu-1} dr < \infty \; ;
$$

(II) when $R < \infty$, the inequality

$$
2\tilde{\varOmega}_p(r) \leqq \alpha^2 \log \, T_p(r) \, + \, (\mu \, + \, 1)(\alpha \, + \, 1) \log \,(R-r)^{-1} \, + \, O(1)
$$

holds for all r in $[R_o, R)$ *except in an open set* $E \subset [R_o, R)$ *such that*

$$
\int_E (R-r)^{-\mu-1} dr < \infty .
$$

(See Weyl [7], p. 198.)

Using this proposition, we obtain the following as in Weyl [7].

PROPOSITION 2. For any numbers $\epsilon > 0$ and $\mu \geq 0$, there exists an r_1 *such that*

(I) when $R = \infty$,

(3)
$$
T_{p+1}(r) < (1+1/p+\varepsilon)T_p(r) + O(\log r),
$$

(4)
$$
T_{p-1}(r) < (1 + 1/(n + 1 - p) + \varepsilon)T_p(r) + O(\log r)
$$

for all $r \ge r$ ^{*x*} except in an open set $E \subset [r]$, ∞) such that

$$
\int_E r^{\mu-1} dr < \infty ;
$$

(II) when $R < \infty$,

(5)
$$
T_{p+1}(r) < (1 + 1/p + \varepsilon)T_p(r) + O(\log (R - r)^{-1}),
$$

(6)
$$
T_{p-1}(r) < (1 + 1/(n + 1 - p) + \varepsilon)T_p(r) + O(\log (R - r)^{-1})
$$

for all $r \in [r_1, R)$ except in an open set $E \subset [r_1, R)$ such that

$$
\int_E (R-r)^{-\mu-1} dr < \infty.
$$

§3. **Theorems and applications**

In this section, we are going to investigate the orders of $T_p(r)$ and improve Propositions 1 and 2.

The order ρ_p of $T_p(r)$ is defined by

$$
\limsup_{r \to \infty} \log T_p(r) /{\log r} = \rho_p \qquad (R = \infty)
$$

or

$$
\limsup_{r\to R}\log\,T_p(r)/\!\!\log\,(R-r)^{-1}=\rho_p\qquad (R<\infty)
$$

and the lower order λ_p of $T_p(r)$ by

$$
\liminf_{r \to \infty} \log T_p(r) / \log r = \lambda_p \qquad (R = \infty)
$$

or

$$
\liminf_{r\to R}\log\,T_p(r)/\!\!\log\,(R-r)^{-1}=\lambda_p\qquad (R<\infty)\;.
$$

THEOREM 1. All $T_p(r)$ are of the same order.

Proof. When $R = \infty$, this was proved by Ahlfors [2]. We prove this theorem when $R < \infty$ applying the method used in Ahlfors [1].

Now, let ρ_p be finite, then for any $\rho > \rho_p$, there is an $r_2(\geq r_1)$ such that, for all $r \in [r_2, R)$ *,*

$$
T_p(r) \leq O((R-r)^{-\rho}).
$$

Here, we apply Proposition 2, (II), (5).

(i) When $r \in E$ and $r_i \le r < R$, we have

$$
T_{p+1}(r) \leq O((R-r)^{-p}).
$$

(ii) When $r \in E$ and $r_2 \le r < R$, let r' be the right hand end point of the maximal interval included in E and containing r. Then, putting $\mu = \rho$, we have

$$
(R-r')^{-\rho} - (R-r)^{-\rho} \leq \rho \int_E (R-r)^{-\rho-1} dr = O(1)
$$

so that

$$
(R-r')^{-\rho} \leq (R-r)^{-\rho} + O(1)
$$

and

$$
\log (R-r')^{-1} = \log (R-r)^{-1} + O(1) .
$$

 $T_{p+1}(r)$ being increasing and $r' \notin E$,

$$
T_{p+1}(r) \leq T_{p+1}(r') \leq O((R-r')^{-\rho}) \leq O((R-r)^{-\rho}) + O(1)
$$

= $O((R-r)^{-\rho}).$

By (i) and (ii), for all *r* sufficiently near *R*

$$
T_{p+1}(r) < O((R-r)^{-\rho}) .
$$

This means $\rho_{p+1} \leq \rho$. As ρ is arbitrarily greater than ρ_p , we obtain ρ_{p+1} $\leq \rho_p$. Similarly, we obtain $\rho_{p-1} \leq \rho_p$ applying (6). It follows that, if one of ρ_p is finite, then all ρ_p are finite and same. This means also that if one of ρ_p is infinite, then all ρ_p are infinite. That is, all $T_p(r)$ are of the same order.

THEOREM 2. All $T_p(r)$ are of the same lower order.

Proof. (I) $R = \infty$. We have only to prove the case when one of $T_p(r)$ is of positive or infinite lower order. Otherwise, all $T_p(r)$ are of lower order zero.

Now, let λ_p be positive or infinite. Then, for any $0 < \lambda < \lambda_p$, there is an $r_{\scriptscriptstyle{3}}(\geqq r_{\scriptscriptstyle{1}})$ such that

$$
T_p(r) \geq r^{\lambda} \qquad (r \geq r_{\rm s}) \; .
$$

We apply Proposition 2, (I), (3).

(i) For $r \in E$ and $r \ge r_3$,

$$
r^{\lambda} \leq (1 + 1/(p - 1) + \varepsilon) T_{p-1}(r) + O(\log r).
$$

(ii) For $r \in E$ and $r \ge r_3$, let \tilde{r} be the left hand end point of the maximal interval included in E and containing r. Then, putting $\mu = \lambda$, we have

$$
r^{\lambda}-\tilde{r}^{\lambda}=\lambda\int_{\tilde{r}}^{r}t^{\lambda-1}dt\leq\lambda\int_{E}t^{\lambda-1}dt=O(1),
$$

so that

 $r^2 \leq \tilde{r}^2 + O(1)$.

As $\tilde{r} \in E$ for sufficiently large r and $T_{p-1}(r)$ is increasing,

$$
\begin{aligned} \tilde{r}^{\wr} &\leq (1+1/(p-1)+\varepsilon)T_{p-1}(\tilde{r})+ \, O\left(\log \tilde{r}\right) \\ &\leq (1+1/(p-1)+\varepsilon)T_{p-1}(r)+\, O\left(\log r\right) \end{aligned}
$$

and

$$
r^2 \leq (1 + 1/(p - 1) + \varepsilon) T_{p-1}(r) + O(\log r) + O(1).
$$

By (i) and (ii), for all sufficiently large r ,

$$
r^{\lambda} \leq (1 + 1/(p - 1) + \varepsilon)T_{p-1}(r) + O(\log r) + O(1).
$$

This means $\lambda \leq \lambda_{p-1}$. As $\lambda < \lambda_p$ and λ is arbitrary, we have $\lambda_p \leq \lambda_{p-1}$. Similarly, using (4) instead of (3), we have $\lambda_p \leq \lambda_{p+1}$. It follows that, if one of λ_p is not zero, then all λ_p are not zero and same.

(II) $R < \infty$. We can prove this theorem by using Proposition 2, (II) as in the case $R = \infty$.

THEOREM 3. If $T_i(r)$ is of finite order, then, for any number $\alpha > 1$, (1) when $R = \infty$, the inequality

$$
2\tilde{\Omega}_p(r) \leq \alpha^2 \log T_p(r) + O(\log r) + O(1)
$$

holds for all sufficiently large values r;

(II) when $R < \infty$, the inequality

$$
2\Omega_p(r) \leq \alpha^2 \log T_p(r) + O\left(\log (R-r)^{-1}\right) + O(1)
$$

holds for all r sufficiently near R.

Proof. (I) $R = \infty$. Let $T_i(r)$ be of finite order ρ_i . Then, by Theorem 1, all $T_p(r)$ are of order ρ_1 . Thus, for any $\rho > \rho_1$, there is an $r_4(\geq R_o)$ such that

$$
T_p(r) \leqq r^{\rho} \qquad (r \geqq r_4)
$$

and for any p-ad *A^p* (Weyl [7]), as

$$
N_p(r, A^p) \leq T_p(r) + C_p,
$$

 C_p being independent of A^p (Ahlfors [2], p. 7 or Wu [8], p. 105),

(7)
$$
n_p(r, A^p) \log 2 \leq \int_r^{2r} n_p(t, A^p)/t dt \leq N_p(2r, A^p) = O(r^p)
$$

for $r \ge r_4$. Now, putting $\mu = \rho$ in Proposition 1,

(8)
$$
2\tilde{Q}_p(r) \leq \alpha^2 \log T_p(r) + \rho(\alpha+1) \log r + O(1)
$$

for all $r \ge R$ ^o except in an open set $E \subset [R_o, \infty)$ such that

$$
\int_E r^{\rho-1} dr < \infty .
$$

For $r \in E$ and $r \ge r_4$, let \tilde{r} be the right hand end point of the maximal interval included in *E* and containing *r.* Then,

(9)
$$
\tilde{r}^{\rho} - r^{\rho} = \rho \int_{r}^{r} t^{\rho-1} dt \leq \rho \int_{E} t^{\rho-1} dt = O(1)
$$

and

(10)
$$
\log \tilde{r} = \log r + O(1).
$$

Further, by (7) and (9),

$$
N_p(\tilde{r}, A^p) - N_p(r, A^p) = \int_r^{\tilde{r}} n_p(t, A^p)/tdt \leq O\Big(\int_r^{\tilde{r}} t^{p-1}dt\Big) = O(1) ,
$$

that is,

$$
N_p(\tilde{r}, A^p) \leq N_p(r, A^p) + O(1).
$$

As

$$
\mathop{\mathfrak{M}}\limits_{A^p} N_p(r,\,A^p) = T_p(r)
$$

(Ahlfors [2], p. 8 or Wu [8], p. 107) and $O(1)$ is independent of A^p , (11) T_p $J(\tilde{r}) \leq T_p(r) + O(1)$.

On the other hand, by (1), we have the equality:

$$
V_p(r) + T_{p-1}(r) + T_{p+1}(r) + \log r/r_o = \tilde{\varOmega}_p(r) - \tilde{\varOmega}_p(r_o) + 2T_p(r)
$$

and this shows that

$$
2T_p(r)+\tilde{Q}_p(r)
$$

is increasing. Thus, we have

$$
2T_{\scriptscriptstyle p}(r)\,+\,\tilde{\varOmega}_{\scriptscriptstyle p}(r)\leqq 2T_{\scriptscriptstyle p}(\tilde{r})\,+\,\tilde{\varOmega}_{\scriptscriptstyle p}(\tilde{r})\;,
$$

so that by (11),

$$
{\tilde{\varOmega}}_p(r)\leq {\tilde{\varOmega}}_p(\tilde{r})\,+\,O(1)\;.
$$

As $\tilde{r} \notin E$, by (8), (10) and (11), we have

$$
2\widetilde{Q}_p(r) \leqq \alpha^2 \log T_p(r) + \rho(\alpha+1) \log r + O(1) .
$$

Thus, for any $r \ge r_4$, the inequality

$$
2{\widetilde{\Omega}}_p(r)\leqq \alpha^2\log\,T_p(r)\,+\,O\left(\log r\right)\,+\,O(1)
$$

holds.

(II) $R < \infty$. We can carry out the proof parallel to the case $R = \infty$. Corresponding to Proposition 2, we have

COROLLARY 1. If $T_1(r)$ is of finite order, for any $\varepsilon > 0$, there is an r_5 such that

(1) when
$$
R = \infty
$$
,
\n $T_{p+1}(r) < (1 + 1/p + \varepsilon)T_p(r) + O(\log r)$,
\n $T_{p-1}(r) < (1 + 1/(n + 1 - p) + \varepsilon)T_p(r) + O(\log r)$

for all $r \geq r_5$; (II) when $R < \infty$,

$$
\begin{aligned} T_{p+1}(r) &< (1+1/p+\varepsilon)T_p(r) + O\left(\log{(R-r)^{-1}}\right), \\ T_{p-1}(r) &< (1+1/(n+1-p)+\varepsilon)T_p(r) + O\left(\log{(R-r)^{-1}}\right) \end{aligned}
$$

for all $r \in [r_{5}, R)$.

When $R = \infty$, it is well-known (see Wu [8]) that if the original curve *x* is transcendental:

$$
\lim_{r\to\infty} T_{1}(r)/\hbox{log}\; r=\infty\;,
$$

then all the associated curves x^p are also transcendental.

Similarly to this fact, we give the following for $R < \infty$.

THEOREM 4. *When R is finite, if*

(12)
$$
\limsup_{r \to R} T_1(r) / \log (R - r)^{-1} = \infty,
$$

then there exists a sequence $\{s_n\}$ *outside an exceptional set E such that*

$$
\lim_{n\to\infty}s_n=R
$$

and

$$
\lim_{n\to\infty} T_p(s_n)/\log(R-s_n)^{-1} = \infty \qquad (p=1,2,\cdots,n)
$$

When the order of $T_i(r)$ ($=\rho_i$) is finite, we hav *Properifierallary 1.* When the order of $T_i(r)$ is infinite, then $T_2(r)$, \cdots , $T_n(r)$ are also of order infinite by Theorem 1. In this case, we apply *Proposition 2, (II), (6) for* $\mu = 0$ *.* First of all, we note that

$$
\rho_1'=\limsup_{\substack{r\to R\\ r\in E}}\log\,T_{\scriptscriptstyle 1}(r)/\!\log\,(R-r)^{-1}=\infty\,\,.
$$

In fact, suppose that ρ'_1 is finite. For any $\tilde{r} \in E$ sufficiently near R, let t_1 be the left hand end point of the maximal interval *I* included in *E* and containing \tilde{r} and t_2 the right hand end point of *I*. Then, $t_1, t_2 \in E$ and

$$
\log{(R-t_\text{\tiny 2})^{-1}}-\log{(R-t_\text{\tiny 1})^{-1}}=\int_{t_\text{\tiny 1}}^{t_\text{\tiny 2}}(R-r)^{-1}dr\leqq\int_{E}(R-r)^{-1}dr=O(1)\:,\\ \log{(R-t_\text{\tiny 1})^{-1}}<\log{(R-\tilde{r})^{-1}}<\log{(R-t_\text{\tiny 2})^{-1}}\:.
$$

From this and $T_i(r)$ being increasing, we have the following:

$$
\begin{aligned} \log\,T_{\text{i}}(t_{\text{i}}) &| \log\,(R\,-\,t_{\text{i}})^{-1} \leqq \log\,T_{\text{i}}(\tilde{r}) /{\log\,(R\,-\,\tilde{r})^{-1}} \\ &\leq \log\,T_{\text{i}}(t_{\text{i}}) /{\log\,(R\,-\,t_{\text{i}})^{-1}} \end{aligned}
$$

and

$$
\lim_{\tilde{r}\to R}\log{(R-t_{\rm i})^{-1}}/{\log{(R-t_{\rm 2})^{-1}}}=1
$$

so that

$$
\limsup_{\substack{\tilde{r}\to R\\ \tilde{r}\in E}}\log\,T_{\scriptscriptstyle 1}(\tilde{r})/\!\!\log{(R-\tilde{r})^{-1}}\leqq \limsup_{\substack{\tilde{r}\to R\\ \tilde{r}\in E}}\log\,T_{\scriptscriptstyle 1}(r)/\!\!\log{(R-r)^{-1}}=\rho_{\scriptscriptstyle 1}'\,.
$$

This means that the order of $T_i(r)$ is finite. This is a contradiction. ρ_i must be ∞ . " $\rho'_1 = \infty$ " means that there is a sequence $\{s_n\} \subset [r_1, R) - E$ such that $s_n \to R$ $(n \to \infty)$ and

$$
\lim_{n\to\infty} T_{1}(s_n)/\text{log }(R-s_n)^{-1}=\infty.
$$

Applying this fact to Proposition 2, (II), (6) for $p = 2, \dots, n$, we have the desired result.

COROLLARY 2. " *The hypothesis H" in Weyl* [7], p. 201 *may be changed by the following:*

"When R is finite,

x is admissible and $\limsup T_i(r)/log(R - r)^{-1} = \infty$." *r-*R*
