# PROPERTIES OF THE SLANT WEIGHTED TOEPLITZ OPERATOR 

SUBHASH CHANDER ARORA ${ }^{1}$ AND RITU KATHURIA ${ }^{2 *}$<br>Communicated by Y. Seo

#### Abstract

If $\beta=\left\langle\beta_{n}\right\rangle_{n \in Z}$ is a sequence of positive numbers, then a slant weighted Toeplitz operator $A_{\phi}$ is an operator on $L^{2}(\beta)$ defined as $A_{\phi}=W M_{\phi}$ where $M_{\phi}$ is the multiplication operator on $L^{2}(\beta)$. When the sequence $\beta \equiv 1$, this operator reduces to the ordinary slant Toeplitz operator given by M.C. Ho in 1996. In this paper, we study some algebraic properties of the slant weighted Toeplitz operator. We also obtain its matrix characterization and discuss the adjoint of this operator.

## 1. Introduction and Preliminaries

Toeplitz operators arise in plenty of applications like prediction theory, wavelet analysis and solution of differential equations. These operators were introduced by O. Toeplitz [7] in the year 1911. Subsequently many mathematicians like Devinatz [10], Abrahmse [3], Brown and Halmos [4] came up with different generalisations of Toeplitz operators. In 1995, Ho [2] introduced the class of slant Toeplitz operator having the property that the matrices with respect to the standard orthonormal basis could be obtained by eliminating every alternate row of the matrices of the corresponding Toeplitz operators. Villemoes [8] associated the Besov regularity of solutions of the refinement equation with the spectral radius of an associated slant Toeplitz operator and Goodman, Micchelli and Ward [9] showed the connection between their spectral radii and conditions for the solutions of certain differential equations being in Lipschitz classes.

[^0]However these studies were made in the context of the usual Hardy spaces $H^{2}$ and $H^{p}$ and the Lorentz spaces $L^{2}$ and $L^{p}$. Meanwhile, the notion of the weighted sequence spaces $H^{2}(\beta), L^{2}(\beta)$ and their generalisations came up. Shields [1] made a systematic study of the shift operator and the multiplication operator on $L^{2}(\beta)$. Lauric [6] studied the Toeplitz operators on $H^{2}(\beta)$. Motivated by the increasing popularity of the spaces $L^{2}(\beta), H^{2}(\beta)$ and the multidirectional applications of the slant Toeplitz operators, we introduced [5] the notion of slant weighted Toeplitz operators. In this paper we further investigate the properties of these operators. The study of weighted Toeplitz operators and that of slant weighted Toeplitz operators is supposed to be meaningful not only to specialists in the theory of Toeplitz operators, but would also be of interest to physicists, probabilists and computer scientists. We begin with the following preliminaries:

Let $\beta=\left\{\beta_{n}\right\}_{n \in Z}$ be a sequence of positive numbers such that $\beta_{0}=1,0<$ $\frac{\beta_{n}}{\beta_{n+1}} \leq 1$ for $n \geq 0$ and $0<\frac{\beta_{n}}{\beta_{n-1}} \leq 1$ for $n \leq 0$. Also let $\frac{\beta_{2 n}}{\beta_{n}}$ be bounded. Consider the spaces [6], [1].

$$
L^{2}(\beta)=\left\{f(z)=\left.\sum_{n=-\infty}^{\infty} a_{n} z^{n}\left|a_{n} \in \mathbb{C},\|f\|_{\beta}^{2}=\sum_{n=-\infty}^{\infty}\right| a_{n}\right|^{2} \beta_{n}^{2}<\infty\right\}
$$

and

$$
H^{2}(\beta)=\left\{f(z)=\left.\sum_{n=0}^{\infty} a_{n} z^{n}\left|a_{n} \in \mathbb{C},\|f\|_{\beta}^{2}=\sum_{n=0}^{\infty}\right| a_{n}\right|^{2} \beta_{n}^{2}<\infty\right\}
$$

Then $\left(L^{2}(\beta),\|\cdot\|_{\beta}\right)$ is a Hilbert space [6] with an orthonormal basis given by $\left\{e_{k}(z)=\frac{z^{k}}{\beta_{k}}\right\}_{k \in Z}$ and with an inner product defined by

$$
\left\langle\sum_{n=-\infty}^{\infty} a_{n} z^{n}, \sum_{n=-\infty}^{\infty} b_{n} z^{n}\right\rangle=\sum_{n=-\infty}^{\infty} a_{n} \bar{b}_{n} \beta_{n}^{2}
$$

Further, $H^{2}(\beta)$ is a subspace [6] of $L^{2}(\beta)$. Now, let

$$
L^{\infty}(\beta)=\left\{\phi(z)=\sum_{n=-\infty}^{\infty} a_{n} z^{n} \mid \phi L^{2}(\beta) \subseteq L^{2}(\beta) \text { and } \exists c \in \mathbb{R}\right.
$$

such that $\|\phi f\|_{\beta} \leq c\|f\|_{\beta}$ for all $\left.f \in L^{2}(\beta)\right\}$.
Then, $L^{\infty}(\beta)$ is a Banach space [6] with respect to the norm defined by

$$
\|\phi\|_{\infty}=\inf \left\{c \mid\|\phi f\|_{\beta} \leq c\|f\|_{\beta} \text { for all } f \in L^{2}(\beta)\right\}
$$

Let $P: L^{2}(\beta) \rightarrow H^{2}(\beta)$ be the orthogonal projection of $L^{2}(\beta)$ onto $H^{2}(\beta)$.
Let $\phi \in L^{\infty}(\beta)$, then the weighted multiplication operator [1] with symbol $\phi$, that is, $M_{\phi}: L^{2}(\beta) \rightarrow L^{2}(\beta)$ is given by

$$
M_{\phi} e_{k}(z)=\frac{1}{\beta_{k}} \sum_{n=-\infty}^{\infty} a_{n} \beta_{n+k} e_{n+k}(z) .
$$

If we put $\phi_{1}(z)=z$, then $M_{\phi_{1}}=M_{z}$ is the operator defined as $M_{z} e_{k}(z)=$ $w_{k} e_{k+1}(z)$, where $w_{k}=\frac{\beta_{k+1}}{\beta_{k}}$ for all $k \in Z$, and is known as a weighted shift [1].

Further, the weighted Toeplitz operator $T_{\phi}[6]$ on $H^{2}(\beta)$ is defined as

$$
T_{\phi}(f)=P(\phi f)
$$

This mapping is well defined, for, if $f \in H^{2}(\beta) \subset L^{2}(\beta)$, then by definition, $\phi f \in L^{2}(\beta)$ and hence $P(\phi f) \in H^{2}(\beta)$. The matrix of $T_{\phi}$ is :

$$
\left[\begin{array}{ccccc}
a_{0} \frac{\beta_{0}}{\beta_{0}} & a_{-1} \frac{\beta_{0}}{\beta_{1}} & a_{-2} \frac{\beta_{0}}{\beta_{2}} & \ldots & \ldots \\
a_{1} \frac{\beta_{1}}{\beta_{0}} & a_{0} \frac{\beta_{1}}{\beta_{1}} & a_{-1} \frac{\beta_{1}}{\beta_{2}} & \ldots & \ldots \\
a_{2} \frac{\beta_{2}}{\beta_{0}} & a_{1} \frac{\beta_{2}}{\beta_{1}} & a_{0} \frac{\beta_{2}}{\beta_{2}} & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots
\end{array}\right] .
$$

Hence the effect of $T_{\phi}$ on the orthonormal basis can be described by

$$
T_{\phi} e_{k}(z)=\frac{1}{\beta_{k}} \sum_{n=0}^{\infty} a_{n-k} \beta_{n} e_{n}(z) .
$$

## 2. Slant weighted Toeplitz operator

Let $\phi \in L^{\infty}(\beta)$. Then the slant weighted Toeplitz operator $A_{\phi}$, introduced in [5] is an operator on $L^{2}(\beta)$ defined as $A_{\phi}: L^{2}(\beta) \rightarrow L^{2}(\beta)$ such that

$$
A_{\phi} e_{k}(z)=\frac{1}{\beta_{k}} \sum_{n=-\infty}^{\infty} a_{2 n-k} \beta_{n} e_{n}(z)
$$

If $W: L^{2}(\beta) \rightarrow L^{2}(\beta)$ such that

$$
W e_{2 n}(z)=\frac{\beta_{n}}{\beta_{2 n}} e_{n}(z)
$$

and

$$
W e_{2 n-1}(z)=0 \quad \text { for all } n \in Z
$$

then an alternate definition of $A_{\phi}[5]$ is given by

$$
A_{\phi}(f)=W M_{\phi}(f)=W(\phi f) \quad \text { for all } f \in L^{2}(\beta)
$$

The matrix of $W$ is

$$
\left[\begin{array}{c|cccccc}
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\hline \vdots & \frac{\beta_{0}}{\beta_{0}} & 0 & 0 & 0 & 0 & \ldots \\
\vdots & 0 & 0 & \frac{\beta_{1}}{\beta_{2}} & 0 & 0 & \ldots \\
\vdots & 0 & 0 & 0 & 0 & \frac{\beta_{2}}{\beta_{4}} & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots
\end{array}\right] .
$$

Also, $\|W\|=\sup \left|\frac{\beta_{n}}{\beta_{2 n}}\right| \leq 1$. The adjoint of $W$ is given by

$$
W^{*} e_{n}(z)=\frac{\beta_{n}}{\beta_{2 n}} e_{2 n}(z), \quad n \in Z
$$

Theorem 2.1. $W$ does not commute with $M_{z}$.
Proof. $A_{\phi}=W M_{\phi}$ and when $\phi=1$,

$$
A_{1}=W M_{1}=W
$$

But since $A_{1}$ is a slant weighted Toeplitz operator, it must satisfy the characterization [5]

$$
\begin{aligned}
& M_{z} A_{1}=A_{1} M_{z^{2}} \\
\Rightarrow \quad & M_{z} W=W M_{z^{2}} .
\end{aligned}
$$

Hence $W$ does not commute with $M_{z}$.
Theorem 2.2. The mapping $\phi \rightarrow A_{\phi}$ is linear and one-to-one.
Proof.

$$
\begin{aligned}
A_{(\alpha \phi+\beta \psi)} & =W M_{(\alpha \phi+\beta \psi)} \\
& =\alpha W M_{\phi}+\beta W M_{\psi} \\
& =\alpha A_{\phi}+\beta A_{\psi}
\end{aligned}
$$

Hence the mapping is linear.
For one-one ness, let $A_{\phi}=A_{\psi}$ where $\phi, \psi \in L^{\infty}(\beta)$. Then

$$
\begin{aligned}
& A_{\phi-\psi}=0 \\
\Rightarrow & A(\phi-\psi) e_{n}(z)=0 \\
\Rightarrow & \text { for all } n \in Z \\
\Rightarrow & W M_{(\phi-\psi)} e_{n}(z)=0 \\
\Rightarrow W(\phi-\psi) e_{n}(z)=0 & \text { for all } n \in Z \\
\Rightarrow & n \in Z .
\end{aligned}
$$

On taking $n=1$,

$$
\begin{aligned}
& W(\phi-\psi) e_{1}(z)=0 \\
\Rightarrow & \phi-\psi=0 \text { or } \phi-\psi \text { has only even coefficients. }
\end{aligned}
$$

On taking $n=2$,

$$
\begin{aligned}
& W(\phi-\psi) e_{2}(z)=0 \\
\Rightarrow & \phi-\psi=0 \text { or } \phi-\psi \text { has only odd coefficients. }
\end{aligned}
$$

Hence we conclude that $\phi-\psi=0$.
Theorem 2.3. $W\left(\phi\left(z^{2}\right)\right)=\phi(z)$ for all $\phi \in L^{2}(\beta)$.

Proof. Let $\phi=\sum_{n=-\infty}^{\infty} a_{n} z^{n}$ be in $L^{2}(\beta)$. Then

$$
\begin{aligned}
W\left(\phi\left(z^{2}\right)\right) & =W\left(\sum a_{n} z^{2 n}\right) \\
& =W \sum a_{n} \beta_{2 n} e_{2 n}(z) \\
& =\sum a_{n} \beta_{n} e_{n}(z) \\
& =\sum a_{n} z^{n}=\phi(z) .
\end{aligned}
$$

Lemma 2.4. If $f(z)$ is an $L^{2}(\beta)$ function, then $f\left(z^{2}\right)$ is also an $L^{2}(\beta)$ function if $\frac{\beta_{2 n}}{\beta_{n}}<M<\infty$ for all $n$.

Proof. Let $f(z)=\sum_{n=-\infty}^{\infty} \alpha_{n} z^{n}$ be an $L^{2}(\beta)$ function.
Then

$$
\|f(z)\|_{\beta}^{2}=\sum_{n=-\infty}^{\infty}\left|\alpha_{n}\right|^{2} \beta_{n}^{2}<\infty
$$

Also, then

$$
f\left(z^{2}\right)=\sum_{n=-\infty}^{\infty} \alpha_{n} z^{2 n}=\sum_{n=-\infty}^{\infty} \alpha_{n} \beta_{2 n} e_{2 n}(z)
$$

Hence

$$
\begin{aligned}
\left\|f\left(z^{2}\right)\right\|_{\beta}^{2} & =\sum\left|\alpha_{n}\right|^{2} \beta_{2 n}^{2} \\
& =\sum_{n=-\infty}^{\infty}\left|\alpha_{n}\right|^{2} \beta_{n}^{2} \times \frac{\beta_{2 n}^{2}}{\beta_{n}^{2}} \\
& \leq M^{2} \sum_{n=-\infty}^{\infty}\left|\alpha_{n}\right|^{2} \beta_{n}^{2}<\infty .
\end{aligned}
$$

Therefore $f\left(z^{2}\right)$ is also an $L^{2}(\beta)$ function.
Theorem 2.5. Let $\frac{\beta_{2 n}}{\beta_{n}}<M<\infty$ for all $n$. Then
(i) $W^{*} f \in L^{2}(\beta)$ if $f \in L^{2}(\beta)$.
(ii) $W W^{*} f(z)=g(z)$ where $g(z)=\sum a_{n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}} z^{n}$ and $g \in L^{2}(\beta)$.
(iii) $W^{*} W f(z)=h\left(z^{2}\right)$ where $h(z)=\sum a_{2 n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}} z^{n}$ and $h \in L^{2}(\beta)$.

Proof. (i)

$$
\begin{aligned}
W^{*} f(z) & =W^{*}\left(\sum a_{n} z^{n}\right) \\
& =W^{*} \sum a_{n} \beta_{n} e_{n}(z) \\
& =\sum a_{n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}} z^{2 n} \\
& =\sum a_{n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}}\left(z^{2}\right)^{n}
\end{aligned}
$$

Hence,

$$
W^{*} f(z)=g\left(z^{2}\right)
$$

where $g(z)=\sum a_{n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}} z^{n}$.
Now clearly $g(z) \in L^{2}(\beta)$. Further from Lemma 2.5, $g\left(z^{2}\right) \in L^{2}(\beta)$. Hence $W^{*} f \in L^{2}(\beta)$.
(ii) $\quad W W^{*} f(z)=W \sum a_{n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}} z^{2 n}$

$$
\begin{aligned}
& =W \sum a_{n} \frac{\beta_{n}^{2}}{\beta_{2 n}} e_{2 n}(z) \\
& =\sum a_{n} \frac{\beta_{n}^{3}}{\beta_{2 n}^{2}} e_{n}(z) \\
& =\sum a_{n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}} z^{n}
\end{aligned}
$$

Thus $W W^{*} f(z)=g(z)$ where $g(z)=\sum a_{n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}} z^{n}$.
(iii) $W^{*} W f(z)=W^{*}\left(W \sum a_{n} z^{n}\right)$

$$
=W^{*}\left(\sum a_{2 n} z^{n}\right)
$$

$$
=W^{*}\left(\sum a_{2 n} \beta_{n} e_{n}(z)\right)
$$

$$
=\sum a_{2 n} \beta_{n} \frac{\beta_{n}}{\beta_{2 n}} e_{2 n}(z)
$$

$$
=\sum a_{2 n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}} z^{2 n}
$$

$$
=\sum a_{2 n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}}\left(z^{2}\right)^{n}
$$

Hence $W^{*} W f(z)=h\left(z^{2}\right)$ where $h(z)=\sum a_{2 n} \frac{\beta_{n}^{2}}{\beta_{2 n}^{2}} z^{n}, n \in Z$.

## 3. Slant weighted Toeplitz matrix

Definition 3.1. Let $w_{n}=\frac{\beta_{n+1}}{\beta_{n}}$ for all $n \in Z$. Then the slant weighted Toeplitz matrix corresponding to the weight sequence $\left\langle w_{n}\right\rangle$ is a bilaterally infinite matrix $\left\langle\lambda_{i j}\right\rangle$ such that

$$
\lambda_{i+1, j+2}=\frac{w_{i}}{w_{j} w_{j+1}} \lambda_{i j} .
$$

It has been proved [5] that $A$ is a slant weighted Toeplitz operator if and only if $M_{z} A=A M_{z^{2}}$ where $M_{z}$ is the weighted shift. We now give another characterization of the slant weighted Toeplitz operator in terms of the matrix defined above.
Theorem 3.2. A necessary and sufficient condition that an operator $A$ on $L^{2}(\beta)$ be a slant weighted Toeplitz operator is that its matrix with respect to the orthonormal basis $\left\{e_{k}(z)=\frac{z^{k}}{\beta_{k}}\right\}_{k \in Z}$ is a slant weighted Toeplitz matrix.
Proof. Let $A_{\phi}$ be a slant weighted Toeplitz operator. Then its matrix $\left\langle\lambda_{i j}\right\rangle$ is given by

$$
\begin{aligned}
\lambda_{i j} & =\left\langle A_{\phi} e_{j}(z), e_{i}(z)\right\rangle \\
& =a_{2 i-j} \frac{\beta_{i}}{\beta_{j}}
\end{aligned}
$$

Also,

$$
\begin{aligned}
\lambda_{i+1, j+2} & =a_{2 i-j} \frac{\beta_{i+1}}{\beta_{j+2}} \\
& =\frac{w_{i}}{w_{j} w_{j+1}} \lambda_{i j}
\end{aligned}
$$

where $w_{n}=\frac{\beta_{n+1}}{\beta_{n}}$ for every $n \in Z$. Thus the matrix of $A_{\phi}$ is a slant weighted Toeplitz matrix.

Conversely, let the matrix $\left\langle\lambda_{i j}\right\rangle$ of an operator $A$ on $L^{2}(\beta)$ be a slant weighted Toeplitz matrix. Then, for all $i, j \in Z$,

$$
\begin{aligned}
\left\langle A e_{j}(z), e_{i}(z)\right\rangle=\lambda_{i j} & =\frac{w_{j} w_{j+1}}{w_{i}} \lambda_{i+1, j+2} \\
& =\frac{w_{j} w_{j+1}}{w_{i}}\left\langle A e_{j+2}(z), e_{i+1}(z)\right\rangle
\end{aligned}
$$

Now,

$$
\begin{aligned}
\left\langle M_{z} A e_{j}, e_{i}\right\rangle & =\left\langle A e_{j}, M_{z}^{*} e_{i}\right\rangle \\
& =\left\langle A e_{j}, w_{i-1} e_{i-1}\right\rangle \\
& =w_{i-1}\left\langle A e_{j}, e_{i-1}\right\rangle \\
& =w_{i-1} \frac{w_{j} w_{j+1}}{w_{i-1}}\left\langle A e_{j+2}, e_{i}\right\rangle \\
& =\left\langle A M_{z^{2}} e_{j}(z), e_{i}(z)\right\rangle .
\end{aligned}
$$

Hence $M_{z} A=A M_{z^{2}}$.
Thus $A$ is a slant weighted Toeplitz operator.
Theorem 3.3. (i) The sum of two slant weighted Toeplitz operators is a slant weighted Toeplitz operator.
(ii) If $M_{\phi}$ is a weighted multiplication operator and $A_{\psi}$ is a slant weighted Toeplitz operator for $\phi, \psi$ in $L^{\infty}(\beta)$, then $M_{\phi} A_{\psi}$ is a slant weighted Toeplitz operator.
(iii) If $\phi \in L^{\infty}(\beta)$, then $A_{\phi\left(z^{2}\right)}=M_{\phi(z)} W$.

Proof. (i) Let $A_{\phi_{1}}$ and $A_{\phi_{2}}$ be two slant weighted Toeplitz operators. Then

$$
\begin{aligned}
\left(A_{\phi_{1}}+A_{\phi_{2}}\right) & =\left(W M_{\phi_{1}}+W M_{\phi_{2}}\right) \\
& =W\left(M_{\phi_{1}}+M_{\phi_{2}}\right) \\
& =W\left(M_{\phi_{1}+\phi_{2}}\right) \\
& =\left(A_{\phi_{1}+\phi_{2}}\right) .
\end{aligned}
$$

(ii) Consider

$$
\begin{array}{r}
M_{z} M_{\phi} A_{\psi}=M_{\phi} M_{z} A_{\psi} \\
=M_{\phi} A_{\psi} M_{z^{2}}
\end{array}
$$

Hence $M_{\phi} A_{\psi}$ is a slant weighted Toeplitz operator
(iii) We know that $M_{z} W=W M_{z^{2}}$. We prove by induction on $n$ that

$$
M_{z^{n}} W=W M_{z^{2 n}}
$$

suppose the result is true for $n=m$.
Then we have $M_{z^{m}} W=W M_{z^{2 m}}$.
Now

$$
\begin{aligned}
M_{z^{m+1} W} & =M_{z} M_{z^{m}} W \\
& =M_{z} W M_{z^{2 m}} \\
& =W M_{z^{2}} M_{z^{2 m}} \\
& =W M_{z^{2(m+1)}} .
\end{aligned}
$$

Thus $M_{z^{n}} W=W M_{z^{2 n}}$ for all positive $n$.
For $n=0$, the result is clear.
For $n=-1$, and odd $j, M_{z^{n}} W e_{j}(z)=0=W M_{z^{2 n}} e_{j}(z)$.
For $n=-1$, and even $j=2 k$ we get

$$
\begin{align*}
M_{z^{n}} W e_{j}(z) & =M_{z^{-1}} W e_{2 k}(z) \\
& =M_{z^{-1}} \frac{\beta_{k}}{\beta_{2 k}} e_{k}(z) \\
& =\frac{\beta_{k}}{\beta_{2 k}} \frac{\beta_{k-1}}{\beta_{k}} e_{k-1}(z) \\
& =\frac{\beta_{k-1}}{\beta_{2 k}} e_{k-1}(z) . \tag{3.1}
\end{align*}
$$

On the other hand,

$$
\begin{align*}
W M_{z^{2 n}} e_{j(z)} & =W M_{z^{-2}} e_{2 k}(z) \\
& =\frac{\beta_{2(k-1)}}{\beta_{2 k}} W e_{2(k-1)}(z) \\
& =\frac{\beta_{k-1}}{\beta_{2 k}} e_{k-1}(z) . \tag{3.2}
\end{align*}
$$

From equations (3.1) and (3.2) we get that $M_{z^{n}} W=W M_{z^{2 n}}$ for $n=-1$.
Further, using induction we can extend this result to all negative integers $n$.
Consequently we get that $M_{z^{n}} W=W M_{z^{2 n}}$ for all $n \in \mathbb{Z}$. This implies further that

$$
M_{\phi(z)} W=W M_{\phi\left(z^{2}\right)} \quad \text { for all } \phi=\sum_{n=-\infty}^{\infty} a_{n} z^{n}
$$

Finally, we get that

$$
\begin{aligned}
A_{\phi\left(z^{2}\right)} & =W M_{\phi\left(z^{2}\right)} \\
& =M_{\phi(z)} W .
\end{aligned}
$$

Theorem 3.4. $W A_{\phi}$ is a slant weighted Toeplitz operator if and only if $\phi=0$.
Proof.

$$
\begin{aligned}
& \left\langle W A_{\phi} e_{j}(z), e_{i}(z)\right\rangle=\frac{w_{j} w_{j+1}}{w_{i}}\left\langle W A_{\phi} e_{j+2}(z), e_{i+1}(z)\right\rangle \\
\Rightarrow \quad & \left\langle A_{\phi} e_{j}(z), W^{*} e_{i}(z)\right\rangle=\frac{w_{j} w_{j+1}}{w_{i}}\left\langle A_{\phi} e_{j+2}(z), W^{*} e_{i+1}(z)\right\rangle \\
\Rightarrow \quad & \left\langle\frac{1}{\beta_{j}} \sum_{n=-\infty}^{\infty} a_{2 n-j} \beta_{n} e_{n}(z), \frac{\beta_{i}}{\beta_{2 i}} e_{2 i}(z)\right\rangle \\
& =\frac{w_{j} w_{j+1}}{w_{i}}\left\langle\frac{1}{\beta_{j+2}} \sum a_{2 n-j-2} \beta_{n} e_{n}(z), \frac{\beta_{i+1}}{\beta_{2 i+2}} e_{2 i+2}(z)\right\rangle \\
\Rightarrow \quad & \frac{\beta_{i}}{\beta_{2 i}} a_{4 i-j} \beta_{2 i}=\frac{\beta_{i}}{\beta_{i+1}} \frac{\beta_{i+1}}{\beta_{2 i+2}}\left\{a_{4 i-j+2} \beta_{2 i+2}\right\} \\
\Rightarrow \quad & a_{4 i-j}=a_{4 i-j+2} \quad \text { for all } i, j \in Z .
\end{aligned}
$$

Putting $i=0$ we get,

$$
a_{-j}=a_{-j+2} .
$$

Hence $a_{0}=a_{2 n}$ and $a_{1}=a_{2 n-1}$ for all $n \in Z$. Now, since $\sum\left|a_{n}\right|^{2} \beta_{n}^{2}<\infty$, hence $\lim _{n \rightarrow \infty} a_{n} \beta_{n}=0$ But $\beta_{n}$ 's are positive.

Hence $\lim _{n \rightarrow \infty} a_{n}=0$.

$$
\begin{array}{ll}
\Rightarrow & a_{0}=a_{1}=0 \\
\Rightarrow & a_{n}=0 \text { for all } n \in Z
\end{array}
$$

Therefore $\phi=0$. The converse is obvious.
Theorem 3.5. $A_{\phi} A_{\psi}$ is not a slant weighted Toeplitz operator in general.

Proof. Let $\left\langle\lambda_{i j}\right\rangle$ and $\left\langle\delta_{i j}\right\rangle$ be the matrices of $A_{\phi}$ and $A_{\psi}$ respectively and let $\left\langle\gamma_{i j}\right\rangle$ be the matrix of the product $A_{\phi} A_{\psi}$. Further let $\phi=\sum_{n=-\infty}^{\infty} a_{n} z^{n}$ and $\psi=\sum_{n=-\infty}^{\infty} b_{n} z^{n}$. Now, [4]

$$
\begin{aligned}
\gamma_{i j} & =\sum_{k=-\infty}^{\infty} \lambda_{i k} \delta_{k j} \\
& =\sum_{k=-\infty}^{\infty} a_{2 i-k} \frac{\beta_{i}}{\beta_{k}} b_{2 k-j} \frac{\beta_{k}}{\beta_{j}} \\
& =\frac{\beta_{i}}{\beta_{j}} \sum_{k=-\infty}^{\infty} a_{2 i-k} b_{2 k-j}
\end{aligned}
$$

Similarly,

$$
\begin{aligned}
\gamma_{i+1, j+2} & =\frac{\beta_{i+1}}{\beta_{j+2}} \sum_{k=-\infty}^{\infty} a_{2 i+2-k} b_{2 k-j-2} \quad \text { take } t=k-2 \\
& =\frac{\beta_{i+1}}{\beta_{j+2}} \sum_{t=-\infty}^{\infty} a_{2 i-t} b_{2 t-j+2}
\end{aligned}
$$

Hence,

$$
\gamma_{i+1, j+2} \neq \frac{w_{i}}{w_{j} w_{j+1}} \gamma_{i, j}
$$

Hence by matrix characterization we conclude that the product is not a slant weighted Toeplitz operator.

Next we obtain a condition for the commutativity of the product of two slant weighted Toeplitz operators.

Theorem 3.6. $A_{\phi} A_{\psi}=A_{\psi} A_{\phi}$ if and only if $\phi\left(z^{2}\right) \psi(z)=\psi\left(z^{2}\right) \phi(z)$.
Proof. Let $A_{\phi}$ and $A_{\psi}$ be two slant weighted Toeplitz operators. Then

$$
\begin{aligned}
A_{\phi(z)} A_{\psi(z)} & =W M_{\phi(z)} W M_{\psi(z)} \\
& =W W M_{\phi\left(z^{2}\right)} M_{\psi(z)} \\
& =W W M_{\phi\left(z^{2}\right) \psi(z)} \\
& =W A_{\phi\left(z^{2}\right) \psi(z)} .
\end{aligned}
$$

On the other hand

$$
\begin{aligned}
A_{\psi(z)} A_{\phi(z)} & =W M_{\psi(z)} W M_{\phi(z)} \\
& =W W M_{\psi\left(z^{2}\right)} M_{\phi(z)} \\
& =W W M_{\psi\left(z^{2}\right) \phi(z)} \\
& =W A_{\psi\left(z^{2}\right) \phi(z)} .
\end{aligned}
$$

Hence $A_{\phi} A_{\psi}=A_{\phi} A_{\phi}$ if and only if $\phi\left(z^{2}\right) \psi(z)=\psi\left(z^{2}\right) \phi(z)$.

Now we give a necessary and sufficient condition for $A_{\phi} A_{\psi}$ to be a slant weighted Toeplitz operator.

Theorem 3.7. $A_{\phi} A_{\psi}$ is a slant weighted Toeplitz operator if and only if $A_{\phi} A_{\psi}=$ 0 .

Proof.

$$
\begin{aligned}
A_{\phi} A_{\psi} & =W M_{\phi} W M_{\psi} \\
& =W W M_{\phi\left(z^{2}\right) \psi(z)} \\
& =W A_{\phi\left(z^{2}\right) \psi(z)}
\end{aligned}
$$

Therefore by Theorem 3.4 we get that $W A_{\phi\left(z^{2}\right) \psi(z)}$ is a slant weighted Toeplitz operator if and only if $\phi\left(z^{2}\right) \cdot \psi(z)=0$ if and only if

$$
A_{\phi} A_{\psi}=0
$$

## 4. The adjoint of slant weighted Toeplitz operator

Given the slant weighted Toeplitz operator $A_{\phi}$, we now prove some results for $A_{\phi}^{*}$.
Theorem 4.1. $A_{\phi}^{*}$ is not a slant weighted Toeplitz operator in general.
Proof. The matrix of $A_{\phi}^{*}$ is given by

$$
\left[\begin{array}{c|cccccccc}
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\hline \vdots & \bar{a}_{0} \frac{\beta_{0}}{\beta_{0}} & \bar{a}_{2} \frac{\beta_{1}}{\beta_{0}} & \bar{a}_{4} \frac{\beta_{2}}{\beta_{0}} & \bar{a}_{6} \frac{\beta_{3}}{\beta_{0}} & \ldots & & & \\
\vdots & \bar{a}_{-1} \frac{\beta_{0}}{\beta_{1}} & \bar{a}_{1} \frac{\beta_{1}}{\beta_{1}} & \bar{a}_{3} \frac{\beta_{2}}{\beta_{1}} & \bar{a}_{5} \frac{\beta_{3}}{\beta_{1}} & \ldots & & & \\
\vdots & \bar{a}_{-2} \frac{\beta_{0}}{\beta_{2}} & \bar{a}_{0} \frac{\beta_{1}}{\beta_{2}} & \bar{a}_{2} \frac{\beta_{2}}{\beta_{2}} & \bar{a}_{4} \frac{\beta_{3}}{\beta_{2}} & \ldots & & & \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots
\end{array}\right]
$$

Since the above matrix does not satisfy the characterization given in Theorem 3.2, $A_{\phi}^{*}$ is not a slant weighted Toeplitz operator.
Theorem 4.2. $A_{\phi}^{*}$ is a slant weighted Toeplitz operator if and only if $\phi=0$.
Proof. If $A_{\phi}^{*}$ is a slant weighted Toeplitz operator, then for all $i, j \in Z$, we have,

$$
\left\langle A_{\phi}^{*} e_{j}(z), e_{i}(z)\right\rangle=\left\langle A_{\phi}^{*} e_{j+2}(z), e_{i+1}(z)\right\rangle \frac{w_{j}}{w_{i}} w_{j+1}
$$

Hence

$$
\left\langle\beta_{j} \sum_{k=-\infty}^{\infty} \bar{a}_{2 j-k} \frac{e_{k}(z)}{\beta_{k}}, e_{i}(z)\right\rangle=\left\langle\beta_{j+2} \sum_{k=-\infty}^{\infty} \bar{a}_{2(j+2)-k} \frac{e_{k}(z)}{\beta_{k}}, e_{i+1}(z)\right\rangle w_{j} \cdot \frac{w_{j+1}}{w_{i}} .
$$

Therefore $\bar{a}_{2 j-i}=\bar{a}_{2 j+3-i}\left(\frac{w_{j} w_{j+1}}{w_{i}}\right)^{2}$ for all $i, j \in Z$. Putting $j=0$, we get $\bar{a}_{-i}=\frac{w_{1}^{2}}{w_{i}^{2}} \bar{a}_{-i+3}$ for all $i \in Z$.

But $\lim _{n \rightarrow \infty} \bar{a}_{n}=0$ as shown in Theorem 3.4. Hence $a_{n}=0$ for all $n \in Z$. So $\phi=0$.

Corollary 4.3. There is no non-zero self adjoint slant weighted Toeplitz operator.

## 5. Compactness

Theorem 5.1. $A_{\phi}$ is compact if and only if $\phi=0$.
Proof. Let $A_{\phi}$ be compact.
$\Leftrightarrow W M_{\phi}$ is compact
$\Leftrightarrow \quad M_{\phi}$ is compact
$\Leftrightarrow \quad \phi=0$
