# INFINITESIMAL VARIATIONS OF INVARIANT SUBMANIFOLDS OF A KAEHLERIAN MANIFOLD 

By Kentaro Yano, U-Hang Ki and Masafumi Okumura

## § 0. Introduction.

Recently infinitesimal variations of submanifolds have been studied by Chen [1], Goldstein [2], Ryan [2], Tachibana [3, 4] and one of the present authors [1, 4].

The purpose of the present paper is to study infinitesimal variations of invariant submanifolds of a Kaehlerian manifold and to generalize some of recent results of Tachibana and one of the present authors.

In the preliminary § 1, we state some properties of invariant submanifolds of a Kaehlerian manifold.

In §2 we prove fundamental formulas in the theory of infinitesimal variations and study complex variations, that is, infinitesimal variations which carry an invariant submanifold into an invariant submanifolds. In § 3, we study holomorphic variations, that is, complex variations which preserve complex structures induced on invariant submanifolds.

In §4, we study complex conformal variations and prove that a complex conformal variation of a compact invariant submanifold of a Kaehlerian manifold is necessarily isometric and hence holomorphic, (Theorem 4.1). In the last $\S 5$ we prove an integral formula and show some of its applications.

## § 1. Invariant submanifolds of a Kaehlerian manifold.

Let $M^{2 m}$ be a real $2 m$-dimensional Kaehlerian manifold covered by a system of coordinate neighborhoods $\left\{U ; x^{h}\right\}$ and $F_{\imath}{ }^{h}$ the almost complex structure tensor and $g_{j i}$ the Hermitian metric tensor, where here and in the sequel, the indices $h, i, j, \cdots$ run over the range $\{1,2, \cdots, 2 m\}$.

Then we have

$$
\begin{gather*}
F_{\imath}{ }^{t} F_{t}^{h}=-\delta_{i}^{h}, \quad F_{j}{ }^{t} F_{\imath}{ }^{s} g_{t s}=g_{j i},  \tag{1.1}\\
\nabla_{j} F_{\imath}{ }^{h}=0, \tag{1.2}
\end{gather*}
$$

where $\nabla$, denotes the operator of covariant differentiation with respect to the Christoffel symbols $\Gamma_{j}{ }_{\imath}{ }_{\imath}$ formed with $g_{j i}$.

Let $M^{n}$ be an $n$-dimensional Riemannian manifold covered by a system of
coordinate neighborhoods $\left\{V ; y^{a}\right\}$ and with the metric tensor $g_{c b}$ where here and in the sequel, the indices $a, b, c, \cdots$ run over the range $\{1,2, \cdots, n\}$. We assume that $M^{n}$ is isometrically immersed in $M^{2 m}$ by the immersion $i: M^{n} \rightarrow M^{2 m}$ and identify $i\left(M^{n}\right)$ with $M^{n}$ itself. We represent the immersion $i$ locally by $x^{h}=x^{h}\left(y^{a}\right)$ and put $B_{b}{ }^{h}=\partial_{b} x^{h}, \partial_{b}=\partial / \partial y^{b}$, which are $n$ linearly independent vectors of $M^{2 m}$ tangent to $M^{n}$. Since the immersion $\imath$ is isometric, we have

$$
\begin{equation*}
g_{c b}=g_{j i} B_{c}{ }^{J} B_{b}{ }^{2} . \tag{1.3}
\end{equation*}
$$

We denote by $C_{y}{ }^{h} 2 m-n$ mutually orthogonal unit normals to $M^{n}$, where here and in the sequel, the indices $x, y, z, \cdots$ run over the range $\{n+1, n+2, \cdots, 2 \mathrm{~m}\}$. Then the equation of Gauss are written as

$$
\begin{equation*}
\nabla_{c} B_{b}{ }^{h}=h_{c b}{ }^{x} C_{x}{ }^{h}, \tag{1.4}
\end{equation*}
$$

where $\nabla_{c}$ denotes the operator of van der Waerden-Bortolotti covariant differentiation along $M^{n}$ with respect the Christoffel symbols $\Gamma_{j}{ }^{h}{ }_{2}$ formed with $g_{j i}$ and those $\Gamma_{c}{ }_{c}{ }_{b}$ formed with $g_{c b}$ and $h_{c b}{ }^{x}$ the second fundamental tensors of $M^{n}$ with respect to the normals $C_{x}{ }^{h}$, and those of Weingarten as

$$
\begin{equation*}
\nabla_{c} C_{x}{ }^{h}=-h_{c}{ }^{a}{ }_{x} B_{a}{ }^{h}, \tag{1.5}
\end{equation*}
$$

where

$$
h_{c}{ }^{a}{ }_{x}=h_{c b x} g^{b a}=h_{c b^{2}} g^{b a} g_{z x}, \quad\left(g^{b a}\right)=\left(g_{b a}\right)^{-1},
$$

and $g_{z x}$ denotes the metric tensor of the normal bundle.
If the transform by $F$ of any vector tangent to $M^{n}$ is always tangent to $M^{n}$, that is, if there exists a tensor field $f_{b}{ }^{a}$ of type $(1,1)$ of $M^{n}$ such that

$$
\begin{equation*}
F_{\imath}{ }^{h} B_{b}{ }^{2}=f_{b}{ }^{a} B_{a}{ }^{h}, \tag{1.6}
\end{equation*}
$$

we say that $M^{n}$ is invariant (or complex) in $M^{2 m}$. (1.6) shows that $F_{i n} B_{0}{ }^{2} C_{x}{ }^{h}=0$, where $F_{2 h}=F_{\imath}{ }^{t} g_{t h}$.

For the transforms by $F$ of normals $C_{y}{ }^{h}$, we then have equations of the form

$$
\begin{equation*}
F_{\imath}{ }^{h} C_{y}{ }^{2}=f_{y}{ }^{x} C_{x}{ }^{h} . \tag{1.7}
\end{equation*}
$$

If we put $f_{y x}=f_{y}{ }^{z} g_{z x}$, then we have $f_{y x}=-f_{x y}$.
From (1.1), (1.3), (1.6) and (1.7), we easily see that

$$
\begin{gather*}
f_{b}^{e} f_{e}^{a}=-\delta_{b}^{a}, \quad f_{c}^{e} f_{b}{ }^{d} g_{e d}=g_{c b},  \tag{1.8}\\
f_{y}{ }^{z} f_{z}^{x}=-\delta_{y}^{x} . \tag{1.9}
\end{gather*}
$$

Differentiating (1.6) and (1.7) covariantly along $M^{n}$ and using (1.2), (1.4) and (1.5), we find

$$
\begin{equation*}
\nabla_{c} f_{b}^{a}=0, \tag{1.10}
\end{equation*}
$$

$$
\begin{gather*}
\nabla_{c} f_{y}^{x}=0,  \tag{1.11}\\
h_{c b} f_{y}{ }^{x}=h_{c e}{ }^{x} f_{b}^{e} . \tag{1.12}
\end{gather*}
$$

Thus, equations (1.8) and (1.10) show that $M^{n}$ is also Kaehlerian. Moreover it follows from (1.12) that

$$
\begin{equation*}
h_{e}{ }^{e} y=0, \tag{1.13}
\end{equation*}
$$

that is, $M^{n}$ is minimal.
Using (1.8), (1.9) and (1.12) we easily verify that

$$
\begin{equation*}
h_{c b}{ }^{x}=-h_{e d}{ }^{x} f_{c}{ }^{e} f_{0}{ }^{d} . \tag{1.14}
\end{equation*}
$$

Equations of Gauss and Codazzi of the submanifold $M^{n}$ are respectively given by

$$
\begin{gather*}
K_{d c b}{ }^{a}=K_{k j i}{ }^{h} B_{d}{ }^{k} B_{c}{ }^{3} B_{b}{ }^{2} B^{a}{ }_{h}+h_{d}{ }^{a}{ }_{x} h_{c b}{ }^{x}-h_{c}{ }^{a}{ }_{x} h_{d b}{ }^{x},  \tag{1.15}\\
K_{k j i}{ }^{h} B_{d}{ }^{k} B_{c}{ }^{3} B_{b}{ }^{2} C^{x}{ }_{h}-\left(\nabla_{d} h_{c b}{ }^{x}-V_{c} h_{d b}{ }^{x}\right)=0, \tag{1.16}
\end{gather*}
$$

where $K_{d c b}{ }^{a}$ is the curvature tensor of $M^{n}$.
Finally, we prepare an useful indentity on a Kaehlerian manifold $M^{n}$ for later use (See [6]);

$$
\begin{equation*}
\frac{1}{2} f^{c e} f_{b}^{d} K_{c e d a}=K_{a b} \tag{1.17}
\end{equation*}
$$

## § 2. Infinitesimal variations of invariant submanifolds.

We consider an infinitesimal variation of invariant submanifold $M^{n}$ of a Kaehlerian manifold $M^{2 m}$ given by

$$
\begin{equation*}
\bar{x}^{h}=x^{h}(y)+\xi^{h}(y) \varepsilon, \tag{2.1}
\end{equation*}
$$

where $\xi^{h}(y)$ is a vector field of $M^{2 m}$ defined along $M^{n}$ and $\varepsilon$ is an infinitesimal. We then have

$$
\begin{equation*}
\bar{B}_{b}{ }^{h}=B_{b}{ }^{h}+\left(\partial_{b} \xi^{h}\right) \varepsilon, \tag{2.2}
\end{equation*}
$$

where $\bar{B}_{0}{ }^{h}=\partial_{b} \bar{x}^{h}$ are linearly independent vectors tangent to the varied submanifold. We displace $\bar{B}_{b}{ }^{h}$ parallelly from the varied point $\left(\bar{x}^{h}\right)$ to the origin point $\left(x^{h}\right)$. We then obtain the vectors

$$
\tilde{B}_{b}{ }^{h}=\bar{B}_{b}{ }^{h}+\Gamma_{\jmath}{ }_{2}{ }_{2}(x+\xi \varepsilon) \xi^{\jmath} \bar{B}_{b}{ }^{2} \varepsilon
$$

at the point $\left(x^{h}\right)$, or

$$
\begin{equation*}
\tilde{B}_{b}{ }^{h}=B_{b}{ }^{h}+\left(\nabla_{b} \xi^{h}\right) \varepsilon, \tag{2.3}
\end{equation*}
$$

neglecting the terms of order higher than one with respect to $\varepsilon$, where

$$
\begin{equation*}
\nabla_{b} \xi^{h}=\partial_{b} \xi^{h}+\Gamma_{\partial}{ }^{h}{ }_{i} B_{b}{ }^{j} \xi^{l} . \tag{2.4}
\end{equation*}
$$

In the sequel we always neglect terms of order higher than one with respect to $\varepsilon$. Thus putting

$$
\begin{equation*}
\delta B_{0}{ }^{h}=\widetilde{B}_{0}{ }^{h}-B_{0}{ }^{h}, \tag{2.5}
\end{equation*}
$$

we have from (2.3)

$$
\begin{equation*}
\delta B_{b}{ }^{h}=\left(\nabla_{0} \xi^{h}\right) \varepsilon . \tag{2.6}
\end{equation*}
$$

Putting

$$
\begin{equation*}
\xi^{h}=\xi^{a} B_{a}{ }^{h}+\xi^{x} C_{x}{ }^{h} \tag{2.7}
\end{equation*}
$$

we have

$$
\begin{equation*}
\nabla_{b} \xi^{h}=\left(\nabla_{b} \xi^{a}-h_{b}{ }_{b}{ }_{x} \xi^{x}\right) B_{a}{ }^{h}+\left(\nabla_{b} \xi^{x}+h_{b a}{ }^{x} \xi^{a}\right) C_{x}{ }^{h} \tag{2.8}
\end{equation*}
$$

because of (1.4) and (1.5).
Now we denote by $\bar{C}_{y}{ }^{h} 2 m-n$ mutually orthogonal unit normals to the varied submanifold and $\widetilde{C}_{y}{ }^{h}$ the vectors obtained from $\bar{C}_{y}{ }^{h}$ by parallel displacement from the point $\left(\tilde{x}^{h}\right)$ to $\left(x^{h}\right)$. Then we have

$$
\begin{equation*}
\widetilde{C}_{y}{ }^{h}=\bar{C}_{y}{ }^{h}+\Gamma_{\jmath}{ }^{h}(x+\xi \varepsilon) \xi^{\jmath} \bar{C}_{y}{ }^{\imath} \varepsilon . \tag{2.9}
\end{equation*}
$$

We put

$$
\begin{equation*}
\delta C_{y}{ }^{h}=\widetilde{C}_{y}{ }^{h}-C_{y}{ }^{h} \tag{2.10}
\end{equation*}
$$

and assume that $\delta C_{y}{ }^{h}$ is of the form

$$
\begin{equation*}
\delta C_{y}{ }^{h}=\eta_{y}{ }^{h} \varepsilon=\left(\eta_{y}{ }^{a} B_{a}{ }^{h}+\eta_{y}{ }^{x} C_{x}{ }^{h}\right) \varepsilon . \tag{2.11}
\end{equation*}
$$

Then, from (2.9), (2.10) and (2.11), we have

$$
\begin{equation*}
\bar{C}_{y}{ }^{h}=C_{y}{ }^{h}-\Gamma_{\jmath}{ }^{h} \varepsilon^{\jmath} \delta^{\jmath} C_{y}{ }^{\imath} \varepsilon+\left(\eta_{y}{ }^{a} B_{a}{ }^{h}+\eta_{y}{ }^{x} C_{x}{ }^{h}\right) \varepsilon . \tag{2.12}
\end{equation*}
$$

Applying the operator $\delta$ to $B_{b}{ }^{3} C_{y}{ }^{2} g_{j i}=0$ and using (2.6), (2.8), (2.11) and $\delta g_{j i}$ $=0$, we find

$$
\left(\nabla_{b} \xi_{y}+h_{b a y} \xi^{a}\right)+\eta_{y b}=0,
$$

where $\xi_{y}=\xi^{z} g_{z y}$ and $\eta_{y b}=\eta_{y}{ }^{c} g_{c b}$, or

$$
\begin{equation*}
\eta_{y}{ }^{a}=-\left(\nabla^{a} \xi_{y}+h_{b}{ }_{y}{ }_{y} \xi^{b}\right), \tag{2.13}
\end{equation*}
$$

$\nabla^{a}$ being defined to be $\nabla^{a}=g^{a c} \nabla_{c}$. Applying also the operator $\delta$ to $C_{y}{ }^{2} C_{x}{ }^{2} g_{j i}=g_{y x}$, and using (2.11) and $\delta g_{J i}=0$, we find

$$
\begin{equation*}
\eta_{y x}+\eta_{x y}=0, \tag{2.14}
\end{equation*}
$$

where $\eta_{y x}=\eta_{y}{ }^{2} g_{z x}$.

We assume that the infinitesimal variation (2.1) carries an invariant submanifold into an invariant submanifold, that is,

$$
\begin{equation*}
F_{\imath}{ }^{h}(x+\xi \varepsilon) \bar{B}_{b}{ }^{2} \text { are linear combinations of } \bar{B}_{b}{ }^{h} . \tag{2.15}
\end{equation*}
$$

Then, using $\nabla_{j} F_{\imath}{ }^{h}=0$ and (1.6), we see that

$$
\begin{aligned}
F_{\imath}{ }^{h}(x+\xi \varepsilon) \bar{B}_{b}{ }^{2} & =\left(F_{\imath}{ }^{h}+\xi^{j} \partial_{j} F_{\imath}{ }^{h} \varepsilon\right)\left(B_{b}{ }^{2}+\partial_{b} \xi^{2} \varepsilon\right) \\
& =\left[F_{\imath}{ }^{h}-\xi^{j}\left(\Gamma_{,}{ }^{h}{ }_{t} F_{\imath}{ }^{t}-\Gamma_{j}{ }^{t}{ }_{i} F_{t}{ }^{h}\right) \varepsilon\right]\left(B_{b}{ }^{2}+\partial_{b} \xi^{2} \varepsilon\right) \\
& =F_{\imath}{ }^{h} B_{b}{ }^{2}+\left(F_{\imath}{ }^{h} \nabla_{b} \xi^{2}-f_{b}{ }^{a} \Gamma_{\partial}{ }^{h}{ }_{i} B_{a}{ }{ }^{i} \xi^{i}\right) \varepsilon,
\end{aligned}
$$

that is, by (2.2)

$$
\begin{equation*}
F_{\imath}{ }^{h}\left(x+\xi_{\varepsilon}\right) \bar{B}_{b}{ }^{2}=f_{b}{ }^{a} \bar{B}_{a}{ }^{\hbar}+\left[F_{\imath}{ }^{h} \nabla_{b} \xi^{\imath}-f_{b}{ }^{a} \nabla_{a} \xi^{h}\right] \varepsilon, \tag{2.16}
\end{equation*}
$$

or, using (2.8),

$$
\begin{align*}
F_{\imath}{ }^{h}(x+\xi \varepsilon) \bar{B}_{b}{ }^{2}= & f_{b}{ }^{a} \bar{B}_{a}{ }^{h}+f_{e}{ }^{a}\left(\nabla_{b} \xi^{e}+h_{b}^{e}{ }_{x} \xi^{x}\right) \bar{B}_{a}{ }^{h} \varepsilon  \tag{2.17}\\
& +\left(\nabla_{b} \xi^{y}+h_{b a}{ }^{y} \xi^{a}\right) f_{y}{ }^{x} \bar{C}_{x}{ }^{h} \varepsilon \\
& -f_{b}{ }^{a}\left(\nabla_{a} \xi^{e}-h_{a}{ }^{e}{ }_{x} \xi^{x}\right) \bar{B}_{e}{ }^{h} \varepsilon \\
& -f_{b}{ }^{e}\left(\nabla_{e} \xi^{x}+h_{e c}{ }^{x} \xi^{c}\right) \bar{C}_{x}{ }^{h} \varepsilon .
\end{align*}
$$

Thus (2.15) is equivalent to

$$
\begin{equation*}
\left(\nabla_{b} \xi^{y}+h_{b c}{ }^{y} \xi^{c}\right) f_{y}{ }^{x}=f_{b}^{e}\left(\nabla_{e} \xi^{x}+h_{c e} \xi^{x} \xi^{c}\right) \tag{2.18}
\end{equation*}
$$

or, by (1.12), to

$$
\begin{equation*}
\left(\nabla_{b} \xi^{y}\right) f_{y}^{x}=f_{b}^{e}\left(\nabla_{e} \xi^{x}\right) . \tag{2.19}
\end{equation*}
$$

An infinitesimal variation given by (2.1) is called an complex varation if it carries an invariant submanifold into an invariant submanifold. Thus we have

Theorem 2.1. In order for an infinitesimal variation to be complex, it is necessary and sufficient that the variation vector $\xi^{h}$ satisfies (2.19).

Corollary 2.2. If a vector field $\xi^{h}$ defines a complex variation, then another vector field $\xi^{\prime h}$ which has the same normal part as $\xi^{h}$ has the same property.

Suppose that an infinitesimal variation given by (2.1) carries a submanifold $x^{h}=x^{h}(y)$ into another submanifold $\bar{x}^{h}=\bar{x}^{h}(y)$ and the tangent space of the original submanifold at $\left(x^{h}\right)$ and that of the varied submanifold at the corresponding point $\left(\bar{x}^{h}\right)$ are parallel. Then we say that the variation is parallel.

Since we have from (2.5), (2.6) and (2.8),

$$
\begin{equation*}
\widetilde{B}_{b}{ }^{h}=\left[\delta_{b}{ }^{a}+\left(\nabla_{b} \xi^{a}-h_{b}{ }^{a}{ }_{x} \xi^{x}\right) \varepsilon\right] B_{a}{ }^{h}+\left(\nabla_{b} \xi^{x}+h_{b a}{ }^{x} \xi^{a}\right) C_{x}{ }^{h} \varepsilon, \tag{2.20}
\end{equation*}
$$

we have the following proposition [5]:

In order for an infinitesimal variation to be parallel, it is necessary and sufficent that

$$
\begin{equation*}
\nabla_{b} \xi^{x}+h_{b a} \xi^{x}=0 . \tag{2.21}
\end{equation*}
$$

If (2.21) is satisfied, then (2.19) is satisfied. Thus we have
Theorem 2.3. A parallel variation is a complex variation.

## § 3. Holomorphic variations.

Suppose that an infinitesimal variation $\bar{x}^{h}=x^{h}+\xi^{h} \varepsilon$ carries an invariant submanifold into an invariant submanifold, that is, it is a complex variation. Then putting

$$
\begin{equation*}
F_{2}{ }^{h}(x+\xi \varepsilon) \bar{B}_{b}{ }^{2}-\left(f_{b}{ }^{a}+\delta f_{b}{ }^{a}\right) \vec{B}_{a}{ }^{h}, \tag{3.1}
\end{equation*}
$$

we have from (2.17) and (2.18)

$$
\begin{equation*}
\delta f_{b}^{a}=\left[\left(\nabla_{b} \xi^{e}-h_{b}{ }^{e}{ }_{x} \xi^{x}\right) f_{e}^{a}-f_{b}{ }^{e}\left(\nabla_{e} \xi^{a}-h_{e}{ }^{a}{ }_{x} \xi^{x}\right)\right] \varepsilon . \tag{3.2}
\end{equation*}
$$

From this fact we conclude
Proposition 3.1. Suppose that an infinitesimal varation is complex. Then the variation of $f_{b}{ }^{a}$ is given by (3.2).

We define $T_{c b}$ by

$$
\begin{equation*}
T_{c b}=\nabla_{c} \xi_{b}-f_{c}^{e} f_{b}{ }^{d} \nabla_{e} \xi_{d}-2 h_{c b x} \xi^{x} . \tag{3.3}
\end{equation*}
$$

Equations (3.2) and (3.3) imply that $\delta f_{b}{ }^{a}=0$ is equivalent to $T_{c b}=0$ because of (1.8) and (1.14).

If a complex variation preserves $f_{b}{ }^{a}$, then we say that it is holomorphic [3].
According to (3.2), (3.3) and remark above, we have
Proposition 3.2. A complex variation is holomorphic if and only if $\nabla_{b} \xi^{a}$ $-h_{b}{ }^{a}{ }_{x} \xi^{x}$ commutes with $f_{b}{ }^{a}$, that is,

$$
\left(\nabla_{b} \xi^{e}-h_{b}{ }^{e}{ }_{x} \xi^{x}\right) f_{e}{ }^{a}-f_{b}{ }^{e}\left(\nabla_{e} \xi^{a}-h_{e}{ }^{a}{ }_{x} \xi^{x}\right)=0,
$$

or, equivalently $T_{c b}=0$.
Now, applying the operator $\delta$ to (1.3) and using (2.6), (2.8) and $\delta g_{j i}=0$, we find (cf. [5])

$$
\begin{equation*}
\delta g_{c b}=\left(\nabla_{b} \xi_{c}+\nabla_{c} \xi_{b}-2 h_{c b x} \xi^{x}\right) \varepsilon, \tag{3.4}
\end{equation*}
$$

from which,

$$
\begin{equation*}
\delta g^{b a}=-\left(\nabla^{b} \xi^{a}+\nabla^{a} \xi^{b}-2 h^{b a}{ }_{x} \xi^{x}\right) \varepsilon . \tag{3.5}
\end{equation*}
$$

A variation of a submanifold for which $\delta g_{c b}=0$ is said to be isometric and that for which $\delta g_{c b}$ proportional to $g_{c b}$ is said to be conformal. Thus we have

Proposition 3.3 ([5]). In order for a varation of a submannfold to be $\imath s o-$ metric or conformal, it is necessary and sufficient that

$$
\begin{equation*}
\nabla_{c} \xi_{b}+\nabla_{b} \xi_{c}-2 h_{c b x} \xi^{x}=0, \tag{3.6}
\end{equation*}
$$

or

$$
\begin{equation*}
\nabla_{c} \xi_{b}+\nabla_{b} \xi_{c}-2 h_{c b x} \xi^{x}=2 \lambda g_{c b}, \tag{3.7}
\end{equation*}
$$

respectively $\lambda$ being a certain function given by

$$
\begin{equation*}
\lambda=\frac{1}{n}\left(\nabla_{c} \xi^{c}-h_{e}^{e} x \xi^{x}\right) . \tag{3.8}
\end{equation*}
$$

We now put

$$
\begin{equation*}
\bar{\Gamma}_{c}{ }_{c}{ }_{b}=\left(\partial_{c} \bar{B}_{b}{ }^{h}+\Gamma{ }_{j}{ }^{h}(\bar{x}) \bar{B}_{c}{ }^{J} \bar{B}_{b}{ }^{i}\right) \bar{B}^{a}{ }_{n} \tag{3.9}
\end{equation*}
$$

and

$$
\delta \Gamma_{c}{ }^{a}{ }_{b}=\bar{\Gamma}_{c}{ }^{a}{ }_{b}-\Gamma_{c}{ }_{c}{ }_{b}{ }_{b},
$$

where $\bar{\Gamma}_{c}{ }_{c}{ }_{b}$ are Christoffel symbols of the deformed submanifold.
Substituting (2.2) and (2.20) into (3.9), we obtain by a straightforward computation,

$$
\begin{equation*}
\delta \Gamma_{c}{ }_{c}{ }_{b}=\left[\left(\nabla_{c} \nabla_{b} \xi^{h}+K_{k j i}{ }^{h} \xi^{h} B_{c}{ }^{J} B_{b}{ }^{i}\right) B^{a}{ }_{h}+h_{c b}{ }^{x}\left(\nabla^{a} \xi_{x}+h_{d}{ }^{a}{ }_{x} \xi^{d}\right)\right] \varepsilon, \tag{3.10}
\end{equation*}
$$

from which, using equations (1.15) of Gauss and those (1.16) of Codazzi of the submanifolds (cf. [5]), we have

$$
\begin{align*}
\delta \Gamma_{c}{ }^{a}{ }_{b}= & \left(\nabla_{c} \nabla_{b} \xi^{a}+K_{d c b}{ }^{a} \xi^{d}\right) \varepsilon  \tag{3.11}\\
& -\left[\nabla_{c}\left(h_{b e x} \xi^{x}\right)+\nabla_{b}\left(h_{c e x} \xi^{x}\right)-\nabla_{e}\left(h_{c b x} \xi^{x}\right)\right] g^{e a} \varepsilon
\end{align*}
$$

because of (2.8).
A variation of a submanifold for which $\delta \Gamma_{c}{ }^{a}{ }_{b}=0$ is said to be affine.
We now prove
Theorem 3.4. A complex isometric varation of a compact invariant submanıfold $M^{n}$ of a Kaehlernan manıfold is necessarily holomorphic.

Proof. If we take account of (1.14), (3.3) and (3.6), we get the following relations:

$$
\begin{gather*}
T_{c b}+f_{c}{ }_{e}^{e} f_{b}{ }^{d} T_{e d}=0,  \tag{3.12}\\
T_{c b}+T_{b c}=0 \tag{3.13}
\end{gather*}
$$

and hence

$$
\begin{equation*}
h^{c b}{ }_{x} \xi^{x} T_{c b}=0 . \tag{3.14}
\end{equation*}
$$

We now calculate $T_{c b} T^{c b}$ :

$$
\begin{align*}
T_{c b} T^{c b} & =\frac{1}{2} T^{c b}\left(T_{c b}-T_{b c}\right)  \tag{3.15}\\
& =\frac{1}{2} T^{c b}\left[\nabla_{c} \xi_{b}-\nabla_{b} \xi_{c}-f_{c}{ }^{e} f_{b}^{d}\left(\nabla_{e} \xi_{d}-\nabla_{d} \xi_{e}\right)\right] \\
& =2 T^{c b} \nabla_{c} \xi_{b} .
\end{align*}
$$

On the other hand, applying the operator $\nabla^{c}$ to (3.3) and using $\nabla_{c} f_{b}{ }^{a}=0$, we find

$$
\nabla^{c} T_{c b}=\nabla^{c} \nabla_{c} \xi_{b}-\frac{1}{2} f^{c e} f_{b}^{d}\left(\nabla_{c} \nabla_{e} \xi_{d}-\nabla_{e} \nabla_{c} \xi_{d}\right)-2 \nabla^{c}\left(h_{c b x} \xi^{x}\right),
$$

from which, using the Ricci-identity,

$$
\nabla^{c} T_{c b}=\nabla^{c} \nabla_{c} \xi_{b}+\frac{1}{2} f^{c e} f_{b}^{d} K_{c e d}{ }^{a} \xi_{a}-2 \nabla^{c}\left(h_{c b x} \xi^{x}\right),
$$

or, using (1.17)

$$
\begin{equation*}
\nabla^{c} T_{c b}=\nabla^{c} \nabla_{c} \xi_{b}+K_{b}{ }^{a} \xi_{a}-2 \nabla^{c}\left(h_{c b x} \xi^{x}\right) . \tag{3.16}
\end{equation*}
$$

An isometric variation is affine and hence we have

$$
\nabla_{c} \nabla_{b} \xi^{a}+K_{d c b}{ }^{a} \xi^{d}-\left[\nabla_{c}\left(h_{b}{ }_{x} \xi^{x} \xi^{x}\right)+\nabla_{b}\left(h_{c}{ }^{a}{ }_{x} \xi^{x}\right)-\nabla^{a}\left(h_{c b x} \xi^{x}\right)\right]=0
$$

because of (3.11), from which

$$
\nabla^{c} \nabla_{c} \xi^{a}+K_{d}{ }^{a} \xi^{d}-2 V^{c}\left(h_{c}{ }^{a}{ }_{x} \xi^{x}\right)=0
$$

because of (1.13). Therefore $\nabla^{c} T_{c b}=0$. From this fact and (3.15), we get

$$
\nabla^{c}\left(T_{c b} \xi^{b}\right)=\frac{1}{2} T_{c b} T^{c b}
$$

Thus, integrating this over $M^{n}$, we see that $T_{c b}=0$ and consequently the variation is holomorphic by Proposition 3.2. This completes the proof.

## §4. Conformal variations.

In this section, we prove the following theorem as a generalization of Theorem 3.4.

Theorem 4.1. A complex conformal variation of a compact invariant submanifold $M^{n}$ of a Kaehlerian manifold is necessarily isometric and hence holomorphic.

Proof. Differentiating (3.7) covariantly along $M^{n}$, we find

$$
\begin{equation*}
\nabla_{c} \nabla_{b} \xi_{a}+\nabla_{c} \nabla_{a} \xi_{b}=2 \nabla_{c}\left(h_{b a x} \xi^{x}+\lambda g_{b a}\right), \tag{4.1}
\end{equation*}
$$

from which, using the Ricci-identity

$$
\nabla_{c} \nabla_{b} \xi_{a}+\nabla_{a} \nabla_{c} \xi_{b}-K_{c a b d} \xi^{d}=2 \nabla_{c}\left(h_{b a x} \xi^{x}+\lambda g_{b a}\right),
$$

or, substituting (4.1) into this,

$$
\begin{aligned}
\nabla_{c} \nabla_{b} \xi_{a} & -\nabla_{a} \nabla_{b} \xi_{c}-K_{c a b d} \xi^{d} \\
& =2 \nabla_{c}\left(h_{b a x} \xi^{x}+\lambda g_{b a}\right)-2 \nabla_{a}\left(h_{b c x} \xi^{x}+\lambda g_{b c}\right) .
\end{aligned}
$$

If we take the skew-symmetric part of this with respect to $a$ and $b$ and make use of the Ricci-identity, then we have

$$
\begin{aligned}
\nabla_{c} \nabla_{b} \xi_{a} & -\nabla_{c} \nabla_{a} \xi_{b}+K_{a b c a} \xi^{d}+K_{c a b d} \xi^{d}+K_{c b a d} \xi^{d} \\
& =-2 \nabla_{a}\left(h_{c b x} \xi^{x}+\lambda g_{c b}\right)+2 \nabla_{b}\left(h_{c a x} \xi^{x}+\lambda g_{c a}\right),
\end{aligned}
$$

or, using (4.1) and the first Bianchis identity,

$$
\begin{align*}
\nabla_{c} \nabla_{b} \xi_{a}-K_{b a c a} \xi^{d}= & \nabla_{c}\left(h_{b a x} \xi^{x}+\lambda g_{b a}\right)+\nabla_{b}\left(h_{c a x} \xi^{x}+\lambda g_{c a}\right)  \tag{4.2}\\
& -\nabla_{a}\left(h_{c b x} \xi^{x}+\lambda g_{c b}\right) .
\end{align*}
$$

Transvecting (4.2) with $g^{c b}$ and using (1.13), we have

$$
\begin{equation*}
\nabla^{c} \nabla_{c} \xi_{a}+K_{a d} \xi^{d}-2 \nabla^{c}\left(h_{c a x} \xi^{x}\right)+(n-2) \nabla_{a} \lambda=0 . \tag{4.3}
\end{equation*}
$$

As in the proof of Theorem 3.4, we also have (3.12)~(3.16) under the conformal variation because of (1.14), (1.17), (3.3) and (3.7).

Comparing (3.16) with (4.3), we obtain

$$
\begin{equation*}
\nabla^{c}\left(T_{c b}+(n-2) \lambda g_{c b}\right)=0 . \tag{4.4}
\end{equation*}
$$

Thus, we have

$$
\begin{aligned}
\nabla^{c}\left[\left(T_{c b}+(n-2) \lambda g_{c b}\right) \xi^{b}\right] & =\left(T_{c b}+(n-2) \lambda \xi_{c b}\right) V^{c} \xi^{b} \\
& =\frac{1}{2} T_{c b} T^{c b}+n(n-2) \lambda^{2}
\end{aligned}
$$

because of (3.8) and (3.15). Since $M^{n}$ is compact, by Green's theorem, it follows that $T_{c b}=0$ and $\lambda=0$ on $M^{n}$ and consequently the variation is isometric and holomorphic. Hence the theorem is proved.

## § 5. An integral formula.

In section 3, we found that a variation of invariant submanifold of a Kaehlerian manifold is holomorphic if and only if $T_{c b}=0$.

In this section, we find some integral formulas involving $T_{c b} T^{c b}$ and prove theorems on holomorphic variations.

We put

$$
\begin{equation*}
f=T_{c b} T^{c b} . \tag{5.1}
\end{equation*}
$$

If we take account of (1.1) and (1.14), then (5.1) reduces to

$$
\begin{align*}
\frac{1}{2} f= & \left(\nabla_{c} \xi_{b}\right)\left(\nabla^{c} \xi^{b}\right)+f_{a}^{c} f^{b e}\left(\nabla_{c} \xi_{b}\right)\left(\nabla^{a} \xi_{e}\right)  \tag{5.2}\\
& -4\left(h_{c b x} \xi^{x}\right) \nabla^{c} \xi^{b}+2\left(h_{c b x} \xi^{x}\right)\left(h^{c b}{ }_{y} \xi^{y}\right) .
\end{align*}
$$

On the other hand, we have

$$
\begin{align*}
\nabla_{b} w^{b}= & \left(\nabla^{b} \nabla_{b} \xi^{c}\right) \xi_{c}+\left(\nabla_{c} \xi_{b}\right)\left(\nabla^{c} \xi^{b}\right)-f^{b e} f^{a c}\left(\nabla_{b} \nabla_{e} \xi_{c}\right) \xi_{a}  \tag{5.3}\\
& -f^{b e} f^{a c}\left(\nabla_{e} \xi_{c}\right)\left(\nabla_{b} \xi_{a}\right)
\end{align*}
$$

because of (1.10), where we have put

$$
w^{b}=\left(\nabla^{b} \xi^{c}\right) \xi_{c}-f^{b e} f^{a c}\left(\nabla_{e} \xi_{c}\right) \xi_{a}
$$

from which, using the Ricci-identity and (1.17),

$$
\begin{equation*}
\nabla^{b} w_{b}=\xi^{c}\left(\nabla^{b} \nabla_{b} \xi_{c}+K_{c b} \xi^{b}\right)+\left(\nabla_{c} \xi_{b}\right)\left(\nabla^{c} \xi^{b}\right)-f^{b e} f^{a c}\left(\nabla_{e} \xi_{c}\right)\left(\nabla_{b} \xi_{a}\right) . \tag{5.4}
\end{equation*}
$$

Comparing (5.2) with (5.4), we have

$$
\begin{aligned}
\frac{1}{2} f= & \nabla^{b} w_{b}-\xi^{c}\left(\nabla^{b} \nabla_{b} \xi_{c}+K_{c b} \xi^{b}\right)-4\left(h_{c b x} \xi^{x}\right) \nabla^{c} \xi^{b} \\
& +2\left(h_{c b x} \xi^{x}\right)\left(h^{c b}{ }_{y} \xi^{y}\right),
\end{aligned}
$$

or, equivalently

$$
\begin{aligned}
\frac{1}{2} f= & \nabla^{b} w_{b}-\xi^{c}\left[\nabla^{b} \nabla_{b} \xi_{c}+K_{c b} \xi^{b}-2 \nabla^{b}\left(h_{c b x} \xi^{x}\right)\right] \\
& -2 \nabla^{b}\left(h_{c b x} \xi^{x} \xi^{c}\right)-2\left(h_{c b x} \xi^{x}\right) \nabla^{c} \xi^{b}+2\left(h_{c b x} \xi^{x}\right)\left(h^{c b} \xi^{y}\right) \\
= & \nabla^{b}\left(w_{b}-2 h_{c b x} \xi^{x} \xi^{c}\right)-\xi^{c}\left[\nabla^{b} \nabla_{b} \xi_{c}+K_{c b} \xi^{b}-2 \nabla^{b}\left(h_{c b x} \xi^{x}\right)\right] \\
& -\left(h^{c b}{ }_{y} \xi^{y}\right)\left(\nabla_{c} \xi_{b}+\nabla_{b} \xi_{c}-2 h_{c b x} \xi^{x}\right) .
\end{aligned}
$$

Thus, assuming the submanifold $M^{n}$ to be compact, we apply Green's theorem and obain

$$
\begin{align*}
& \int\left[\frac{1}{2} f+\xi^{c}\left\{\nabla^{b} \nabla_{b} \xi_{c}+K_{c b} \xi^{b}-2 V^{b}\left(h_{c b x} \xi^{x}\right)\right\}\right.  \tag{5.5}\\
& \left.\quad+\left(h^{c b}{ }_{y} \xi^{y}\right)\left(\nabla_{c} \xi_{b}+\nabla_{b} \xi_{c}-2 h_{c b x} \xi^{x}\right)\right] d V=0,
\end{align*}
$$

$d V$ being the volume element of $M^{n}$.
From (3.4) and (3.5), the variation of $d V$ is given by (cf. [5])

$$
\begin{equation*}
\delta d V=\left(\nabla_{a} \xi^{a}-h_{a}{ }^{a}{ }_{x} \xi^{x}\right) d V \varepsilon . \tag{5.6}
\end{equation*}
$$

For a compact orientable submanifold $M^{n}$, we know the following integral formula:

$$
\int\left[\xi^{c}\left(\nabla^{b} \nabla_{b} \xi_{c}+K_{c b} \xi^{b}\right)+\frac{1}{2}\left(\nabla_{c} \xi_{b}+\nabla_{b} \xi_{c}\right)\left(\nabla^{c} \xi^{b}+\nabla^{b} \xi^{c}\right)-\left(\nabla_{b} \xi^{b}\right)^{2}\right] d V=0,
$$

which is valid for any vector $\xi^{c}$ in $M^{n}$ ([6]), from which

$$
\begin{align*}
& \int\left[\xi^{c}\left\{\left(\nabla^{b} \nabla_{b} \xi_{c}+K_{c b} \xi^{b}\right)-2 V^{b}\left(h_{c b x} \xi^{x}\right)+\nabla_{c}\left(h_{b}{ }^{b}{ }_{x} \xi^{x}\right)\right\}\right.  \tag{5.7}\\
& \quad+\frac{1}{2}\left(\nabla_{c} \xi_{b}+\nabla_{b} \xi_{c}-2 h_{c b y} \xi^{y}\right)\left(\nabla^{c} \xi^{b}+\nabla^{b} \xi^{c}-2 h^{c b}{ }_{x} \xi^{x}\right) \\
& \quad-\left(\nabla_{c} \xi^{c}-h_{c}{ }^{c} \xi^{x}\right)\left(\nabla_{b} \xi^{b}\right) \\
& \left.\quad+\left(h^{c b}{ }_{y} \xi^{y}\right)\left(\nabla_{c} \xi_{b}+\nabla_{b} \xi_{c}-2 h_{c b x} \xi^{x}\right)\right] d V=0,
\end{align*}
$$

or, using (1.13), (5.1) and (5.5)

$$
\begin{gather*}
\int\left[-T_{c b} T^{c b}+\left(\nabla_{c} \xi_{b}+\nabla_{b} \xi_{c}-2 h_{c b y} \xi^{y}\right)\left(V^{c} \xi^{b}+\nabla^{b} \xi^{c}-2 h^{c b}{ }_{x} \xi^{x}\right)\right.  \tag{5.8}\\
\left.-2\left(\nabla_{c} \xi^{c}\right)^{2}\right] d V=0,
\end{gather*}
$$

or, using $T_{c}{ }^{c}=0$ which is obtained from (1.13) and (3.3),

$$
\begin{align*}
& \int\left[\left(\nabla_{c} \xi_{b}+\nabla_{b} \xi_{c}-2 h_{c b x} \xi^{x}\right)\left(\nabla^{c} \xi^{b}+\nabla^{b} \xi^{c}-2 h^{c b} \xi^{y}\right)\right.  \tag{5.9}\\
& \left.\quad-\left(T_{c b}+\sqrt{\frac{2}{n}}\left(\nabla_{c} \xi^{c}\right) g_{c b}\right)\left(T^{c b}+\sqrt{\frac{2}{n}}\left(\nabla_{d} \xi^{d}\right) g^{c b}\right)\right] d V=0,
\end{align*}
$$

that is, we get an integral formula for an invariant submanifold $M^{n}$ in a Kaehlerian manifold. Thus we have

Proposition 5.1. In order for a complex variation of a compact muariant submanıfold of a Kaehlerian mannfold to be isometric it is necessary and sufficient that the variation is volume-preserving and holomorphic.

Now, if a variation of the submanifold is affine, we have from (3.11)

$$
\nabla_{c} \nabla_{b} \xi_{a}+K_{d c b a} \xi^{d}-\nabla_{c}\left(h_{b a x} \xi^{x}\right)-\nabla_{b}\left(h_{c a x} \xi^{x}\right)+\nabla_{a}\left(h_{c b b} \xi^{x}\right)=0,
$$

from which, using (1.13)

$$
\nabla_{c}\left(\nabla_{a} \xi^{a}\right)=0,
$$

that is, $\nabla_{a} \xi^{a}=$ const. Thus, assuming the submanifold to be compact, we have $\nabla_{a} \xi^{a}=0$. From this fact and Proposition 5.1, we obtain

Theorem 5.2. A complex variation of a compact invariant submannfold of a Kaehlerian manufold is isometric if and only if the variation is affine and holomorphic.

Remark. From (5.9), we immediately see that if a variation of submanifold is conformal, then $\lambda=0$ and $T_{c b}=0$. This gives another proof of Theorem 4.1.
