# ON $(f, g, u, v, w, \lambda, \mu, \nu)$-STRUCTURES SATISFYING $\lambda^{2}+\mu^{2}+\nu^{2}=1$ 

Dedicated to professor S. Maruyama on his sixtieth birthday

By Kentaro Yano and U-Hang Kı

## § 0. Introduction.

It is now well known that a submanifold of codimension 3 of an almost Hermitian manifold admits an ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure induced from the almost Hermitian structure of the ambient manifold, a submanifold of codimension 2 of an almost contact metric manifold admits a same kind of structure induced from the almost contact metric structure of the ambient manifold and a hypersurface of a manifold with ( $f, g, u, v, \lambda$ )-structure admits a same kind of structure induced from that of the ambient manifold.

In the present paper we show that under a certain condition a submanifold of codimension 3 of an almost Hermitian manifold admits an almost contact metric structure and study the properties of this almost contact metric structure.

In $\S 1$, we define the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure and in $\S 2$, we show that this kind of structure gives an almost contact metric structure when $\lambda^{2}+\mu^{2}+\nu^{2}=1$, and find condition under which the almost contact metric structure is normal, contact or Sasakian.

In $\S 3$, we study the case in which the vector field $p$ appeared in $\S 2$, vanishes identically and show that in this case the submanifold admits also an almost contact metric structure.
§4 is devoted to the study of submanifolds of codimension 3 of an almost Hermitian or Kaehlerian manifold admitting an almost contact metric structure, and $\S 5$ to the study of those of an even-dimensional Euclidean space.

The authors would like to express here their sincere gratitude to Professors S . Ishihara and M . Okumura who gave them many valuable suggestions to improve the paper. The second author wishes to express his gratitude to Nihon Kokusai Kyoiku Kyokai who gave him the opportunity to study at Tokyo Institute of Technology.
§1. (f, g, $u, v, w, \lambda, \mu, \nu)$-structures.
Let $M^{2 n+4}$ be a $(2 n+4)$-dimensional almost Hermitian manifold covered by a system of coordinate neighborhoods $\left\{U ; \xi^{A}\right\}$ and denote by $G_{C B}$ components of
the Hermitian metric tensor and by $F_{B}{ }^{4}$ those of the almost complex structure tensor of $M^{2 n+4}$, where and in the sequel the indices $A, B, C, \cdots$ run over the range $\{1,2, \cdots, 2 n+4\}$. Then we have

$$
\begin{equation*}
F_{C}{ }^{B} F_{B}{ }^{A}=-\delta_{C}^{A}, \tag{1.1}
\end{equation*}
$$

$$
\begin{equation*}
F_{C}{ }^{E} F_{B}^{D} G_{E D}=G_{C B}, \tag{1.2}
\end{equation*}
$$

$\delta_{C}^{A}$ being the Kronecker delta.
Let $M^{2 n+1}$ be a $(2 n+1)$-dimensional Riemannian manifold covered by a system of coordinate neighborhoods $\left\{V ; \eta^{h}\right\}$ and immersed isometrically in $M^{2 n+4}$ by the immersion $i: M^{2 n+1} \rightarrow M^{2 n+4}$, where and in the sequel the indices $h, \imath, j, k, \cdots$ run over the range $\left\{1^{\prime}, 2^{\prime}, \cdots,(2 n+1)^{\prime}\right\}$. In the sequel we identify $\imath\left(M^{2 n+1}\right)$ with $M^{2 n+1}$ itself and represent the immersion by

$$
\begin{equation*}
\hat{\xi}^{A}=\xi^{A}\left(\eta^{h}\right) \tag{1.3}
\end{equation*}
$$

We put

$$
\begin{equation*}
B_{\imath}{ }^{A}=\partial_{i} \xi^{A}, \quad \partial_{i}=\partial / \partial \eta^{2} \tag{1.4}
\end{equation*}
$$

and denote by $C^{A}, D^{A}$ and $E^{A}$ three mutually orthogonal unit normals to $M^{2 n+1}$. Then denoting by $g_{j i}$ the fundamental metric tensor of $M^{2 n+1}$, we have

$$
\begin{equation*}
g_{j i}=B_{\jmath}{ }^{C} B_{\imath}{ }^{B} G_{C B}, \tag{1.5}
\end{equation*}
$$

since the immersion is isometric.
As to the transforms of $B_{2}{ }^{A}, C^{A}, D^{A}$ and $E^{A}$ by $F_{B}{ }^{A}$ we have respectively equations of the form

$$
\begin{equation*}
F_{B}{ }^{A} B_{\imath}{ }^{B}=f_{\imath}{ }^{h} B_{h}{ }^{A}+u_{\imath} C^{A}+v_{i} D^{A}+w_{\imath} E^{A}, \tag{1.6}
\end{equation*}
$$

$$
\begin{equation*}
F_{B}{ }^{A} C^{B}=-u^{h} B_{n}{ }^{A} \quad-\nu D^{A}+\mu E^{A}, \tag{1.7}
\end{equation*}
$$

$$
\begin{equation*}
F_{B}^{A} D^{B}=-v^{h} B_{h}^{A}+\nu C^{A} \quad-\lambda E^{A}, \tag{5}
\end{equation*}
$$

$$
\begin{equation*}
F_{B}^{A} E^{B}=-w^{h} B_{h}{ }^{A}-\mu C^{A}+\lambda D^{A}, \tag{1.8}
\end{equation*}
$$

where $f_{2}{ }^{h}$ is a tensor field of type (1, 1), $u_{2}, v_{i}, w_{\imath} 1$-forms and $\lambda, \mu, \nu$ functions in $M^{2 n+1}, u^{h}, v^{h}$ and $w^{h}$ being vector fields associated with $u_{\imath}, v_{i}$ and $w_{\imath}$ respectively.

Applying the operator $F$ to both sides of (1.6), (1.7), (1.8) and (1.9), using (1.1) and these equations and comparing tangent part and normal part of both sides, we find

$$
\begin{equation*}
f_{2}^{t} f_{t}^{h}=-\delta_{i}^{h}+u_{\imath} u^{h}+v_{i} v^{h}+w_{\imath} w^{h}, \tag{1.10}
\end{equation*}
$$

$$
\begin{align*}
& \left\{\begin{array}{l}
u_{t} f_{2}^{t}=\quad-\nu v_{i}+\mu w_{\imath}, \\
v_{t} f_{2}^{t}=\quad \nu u_{2}-\lambda w_{2}, \\
w_{t} f_{2}^{t}=-\mu u_{i}+\lambda v_{i},
\end{array}\right.  \tag{1.11}\\
& \begin{cases}f_{t}^{h} u^{t}=\quad \nu v^{h}-\mu w^{h}, \\
f_{t}^{h} v^{t}=-\nu u^{h} \quad+\lambda w^{h}, \\
f_{t}^{h} w^{t}=\mu u^{h}-\lambda v^{h},\end{cases}  \tag{1.12}\\
& \left\{\begin{array}{lll}
u_{t} u^{t}=1-\mu^{2}-\nu^{2}, & u_{t} v^{t}=\lambda \mu, & u_{t} w^{t}=\lambda \nu, \\
v_{t} v^{t}=1-\nu^{2}-\lambda^{2}, & v_{t} w^{t}=\mu \nu, \\
& w_{t} w^{t}=1-\lambda^{2}-\mu^{2} .
\end{array}\right.
\end{align*}
$$

Also, from (1.2), (1.5) and (1.6), we find

$$
\begin{equation*}
f_{j}{ }^{t} f_{i}{ }^{s} g_{t s}=g_{j i}-u, u_{i}-v_{j} v_{i}-w_{j} w_{\imath} . \tag{1.14}
\end{equation*}
$$

Putting

$$
\begin{equation*}
f_{j i}=f_{j}{ }^{t} g_{t \imath} \tag{1.15}
\end{equation*}
$$

and comparing (1.10) with (1.14), we see that

$$
\begin{equation*}
f_{j i}=-f_{i \jmath} . \tag{1.16}
\end{equation*}
$$

In general, we call an ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure a structure given by a set of a tensor field $f_{2}{ }^{h}$ of type (1, 1), a Riemannian metric tensor $g_{j i}$, three 1 -forms $u_{2}, v_{i}, w_{2}$ and three functions $\lambda, \mu, \nu$ in $M^{2 n+1}$ satisfying equations (1.10) $\sim(1.14)([6])$.

Considering a submanifold $M^{2 n+1}$ of codimension 2 of an almost contact metric manifold $M^{2 n+3}$ or a hypersurface $M^{2 n+1}$ of a manifold with ( $f, g, u, v$, $\lambda)$-structure ([11]), we also obtain an ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure as the structure induced from that of the ambient manifold ([6]).

An $(f, g, u, v, w, \lambda, \mu, \nu)$-structure is said to be normal if the tensor field $S_{j i}{ }^{h}$ of type $(1,2)$ defined by

$$
\begin{align*}
S_{j i}^{h}= & N_{j i}^{h}+\left(\partial_{\jmath} u_{\imath}-\partial_{i} u_{\jmath}\right) u^{h}+\left(\partial_{\jmath} v_{\imath}-\partial_{\imath} v_{j}\right) v^{h}  \tag{1.17}\\
& +\left(\partial_{\jmath} w_{\imath}-\partial_{i} w_{j}\right) w^{h}
\end{align*}
$$

vanishes identically, where $N_{j i}{ }^{h}$ is the Nijenhuis tensor formed with $f_{2}{ }^{h}$, that is,

$$
\begin{equation*}
N_{j i}{ }^{h}=f_{j}^{t} \partial_{t} f_{2}^{h}-f_{2}{ }^{t} \partial_{t} f_{j}^{h}-\left(\partial_{j} f_{2}^{t}-\partial_{2} f_{j}^{t}\right) f_{t}^{h} . \tag{1.18}
\end{equation*}
$$

§ 2. Vector field $p$ and almost contact metric structure ( $f, g, p$ ).
From (1.12), we find

$$
\begin{equation*}
f_{t}^{h} p^{t}=0, \tag{2.1}
\end{equation*}
$$

where

$$
\begin{equation*}
p^{h}=\lambda u^{h}+\mu v^{h}+\nu w^{h} . \tag{2.2}
\end{equation*}
$$

From (2.2) we have

$$
u_{t} p^{t}=\lambda u_{t} u^{t}+\mu u_{t} v^{t}+\nu u_{t} w^{t}
$$

from which, using (1.13), we find $u_{t} p^{t}=\lambda$. Similarly we can find

$$
\begin{equation*}
u_{t} p^{t}=\lambda, \quad v_{t} p^{t}=\mu, \quad w_{t} p^{t}=\nu . \tag{2.3}
\end{equation*}
$$

Thus we have

$$
\begin{equation*}
\lambda^{2}+\mu^{2}+\nu^{2}=c^{2} \tag{2.4}
\end{equation*}
$$

where $p_{t} p^{t}=c^{2}(c \geqq 0)$.
We easily see from (1.13) that $0 \leqq \lambda^{2}+\mu^{2}+\nu^{2} \leqq \frac{3}{2}$. But we can prove here that

$$
\begin{equation*}
0 \leqq \lambda^{2}+\mu^{2}+\nu^{2} \leqq 1 . \tag{2.5}
\end{equation*}
$$

In fact, if $c \geqq 1$, then $\lambda^{2}-c^{2}\left(1-\mu^{2}-\nu^{2}\right)=-\left(\mu^{2}+\nu^{2}\right)\left(1-c^{2}\right) \geqq 0$. Consequently considering the square of the length of the vector $c^{2} u_{2}-\left(\lambda+\sqrt{\lambda^{2}-c^{2}\left(1-\mu^{2}-\nu^{2}\right)}\right) p_{i}$, we have

$$
\begin{aligned}
& {\left[c^{2} u_{t}-\left(\lambda+\sqrt{\lambda^{2}-c^{2}\left(1-\mu^{2}-\nu^{2}\right)}\right) p_{t}\right] \times} \\
& \quad\left[c^{2} u^{t}-\left(\lambda+\sqrt{\lambda^{2}-c^{2}\left(1-\mu^{2}-\nu^{2}\right)}\right) p^{t}\right]=0,
\end{aligned}
$$

where we have used (1.13) and (2.3). Thus we have

$$
c^{2} u_{i}=\left(\lambda+\sqrt{\lambda^{2}-c^{2}\left(1-\mu^{2}-\nu^{2}\right)}\right) p_{i} .
$$

Transvecting the last equality with $p^{2}$ and using (2.3), we have $c^{2}=1$. Thus (2.5) is proved.

Suppose that the set $(f, g, p)$ of the tensor field of type $(1,1)$, the Riemannian metric tensor $g_{j i}$ and the vector field $p^{h}$ given by (2.2) defines an almost contact metric structure, that is, in addition to (2.1), the set ( $f, g, p$ ) satisfies

$$
\begin{equation*}
f_{2}{ }^{t} f_{t}^{h}=-\delta_{i}^{h}+p_{i} p^{h}, \tag{2.6}
\end{equation*}
$$

$$
(f, g, u, v, w, \lambda, \mu, \nu) \text {-STRUCTURES }
$$

$$
\begin{gather*}
f_{j}^{t} f_{2}^{s} g_{t s}=g_{j i}-p_{\partial} p_{i},  \tag{2.7}\\
p_{t} p^{t}=1,
\end{gather*}
$$

where $p_{i}=g_{i t} p^{t}$. Then we find from (2.4) and (2.8)

$$
\begin{equation*}
\lambda^{2}+\mu^{2}+\nu^{2}=1 . \tag{2.9}
\end{equation*}
$$

Conversely suppose that the functions $\lambda, \mu, \nu$ satisfy (2.9). Then we have (2.8) and consequently (1.13) reduces to

$$
\left\{\begin{array}{lll}
u_{t} u^{t}=\lambda^{2}, & u_{t} v^{t}=\lambda \mu, & u_{t} w^{t}=\lambda \nu,  \tag{2.10}\\
& v_{t} v^{t}=\mu^{2}, & v_{t} w^{t}=\mu \nu, \\
& & w_{t} w^{t}=\nu^{2} .
\end{array}\right.
$$

Using (2.3) and (2.10) and computing the squares of lengths of vectors $u_{i}-\lambda p_{i}, v_{i}-\mu p_{i}$ and $w_{i}-\nu p_{i}$, we find

$$
\begin{equation*}
u_{i}=\lambda p_{i}, \quad v_{i}=\mu p_{i}, \quad w_{i}=\nu p_{i} . \tag{2.11}
\end{equation*}
$$

Substituting (2.11) into (1.10) and using (2.9), we find

$$
f_{\imath}{ }^{t} f_{t}^{h}=-\delta_{i}^{h}+p_{i} p^{h} .
$$

Also substituting (2.11) into (1.14) and using (2.9), we have

$$
f_{l}^{t} f_{2}^{s} g_{t s}=g_{j i}-p_{j} p_{i}
$$

Thus we see that the set $(f, g, p)$, where $p$ is given by (2.2), defines an almost contact metric structure. Hence we have

Theorem 2.1. Let $M^{2 n+1}$ be a differentiable manifold with an ( $f, g, u, v, w$, $\lambda, \mu, \nu)$-structure. In order for the set ( $f, g, p$ ), $p$ being given by (2.2), to define an almost contact metric structure, it is necessary and sufficient that $\lambda^{2}+\mu^{2}+\nu^{2}=1$.

Suppose that the set ( $f, g, p$ ) defines an almost contact metric structure. Then we have (2.11) and consequently

$$
\begin{aligned}
& \left(\partial_{\jmath} u_{i}-\partial_{i} u_{j}\right) u^{h}+\left(\partial_{\jmath} v_{i}-\partial_{i} v_{j}\right) v^{h}+\left(\partial_{\jmath} w_{i}-\partial_{i} w_{j}\right) w^{h} \\
= & \left(\lambda^{2}+\mu^{2}+\nu^{2}\right)\left(\partial_{\jmath} p_{i}-\partial_{i} p_{j}\right) p^{h} \\
& +\lambda\left(p_{i} \partial_{\jmath} \lambda-p_{j} \partial_{i} \lambda\right) p^{h}+\mu\left(p_{i} \partial_{\jmath} \mu-p_{j} \partial_{i} \mu\right) p^{h}+\nu\left(p_{i} \partial_{\jmath} \nu-p_{j} \partial_{i} \nu\right) p^{h},
\end{aligned}
$$

from which, using $\lambda^{2}+\mu^{2}+\nu^{2}=1$ and $\lambda \partial_{j} \lambda+\mu \partial_{j} \mu+\nu \partial_{j} \nu=0$,

$$
\begin{align*}
N_{j i}{ }^{h}+\left(\partial_{\jmath} u_{\imath}\right. & \left.-\partial_{i} u_{j}\right) u^{h}+\left(\partial_{\jmath} v_{i}-\partial_{i} v_{\jmath}\right) v^{h}+\left(\partial_{\jmath} w_{\imath}-\partial_{i} w_{j}\right) w^{h}  \tag{2.12}\\
& =N_{j i}{ }^{h}+\left(\partial_{\jmath} p_{i}-\partial_{i} p_{j}\right) p^{h} .
\end{align*}
$$

Thus we have
ThEOREM 2.2. Let $M^{2 n+1}$ be a differentrable mannfold with an ( $f, g, u, v, w$, $\lambda, \mu, \nu)$-structure and suppose that the set ( $f, g, p$ ), p being given by (2.2), defines an almost contact metric structure. In order for the almost contact metric structure $(f, g, p)$ to be normal, it is necessary and sufficient that the ( $f, g, u, v, w, \lambda$, $\mu, \nu$ )-structure is normal.

We now suppose that the set $(f, g, p)$ defines an almost contact metric structure and the structure is contact, that is,
(2.13)

$$
2 f_{j i}=\partial_{j} p_{i}-\partial_{i} p_{j} .
$$

Then from (2.11) and (2.13), we have

$$
\begin{aligned}
& 2 \lambda f_{j i}=\partial_{\jmath} u_{\imath}-\partial_{i} u_{\jmath}-\left(p_{i} \partial_{\jmath} \lambda-p_{j} \partial_{i} \lambda\right), \\
& 2 \mu f_{j i}=\partial_{\jmath} v_{i}-\partial_{i} v_{\jmath}-\left(p_{i} \partial_{\jmath} \mu-p_{j} \partial_{i} \mu\right), \\
& 2 \nu f_{j i}=\partial_{\jmath} w_{\imath}-\partial_{i} w_{\jmath}-\left(p_{i} \partial_{\jmath} \nu-p_{j} \partial_{i} \nu\right),
\end{aligned}
$$

from which, using $\lambda^{2}+\mu^{2}+\nu^{2}=1$ and $\lambda \partial_{,} \lambda+\mu \partial_{\rho} \mu+\nu \partial_{,} \nu=0$, we find

$$
\begin{equation*}
2 f_{j i}=\lambda\left(\partial_{\jmath} u_{\imath}-\partial_{i} u_{j}\right)+\mu\left(\partial_{\jmath} v_{i}-\partial_{i} v_{\jmath}\right)+\nu\left(\partial_{\jmath} w_{\imath}-\partial_{i} w_{j}\right) . \tag{2.14}
\end{equation*}
$$

Conversely suppose that the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure satisfies (2.14) and the set ( $f, g, p$ ), $p$ being given by (2.2), defines an almost contact metric structure. Then we have (2.9) and (2.11). Consequently substitution of (2.11) into (2.14) yields

$$
\begin{aligned}
2 f_{j i}= & \left(\lambda^{2}+\mu^{2}+\nu^{2}\right)\left(\partial_{j} p_{\imath}-\partial_{i} p_{j}\right) \\
& +\lambda\left(p_{i} \partial_{j} \lambda-p_{j} \partial_{i} \lambda\right)+\mu\left(p_{\imath} \partial_{j} \mu-p_{j} \partial_{i} \mu\right)+\nu\left(p_{i} \partial_{j} \nu-p_{j} \partial_{i} \nu\right)
\end{aligned}
$$

from which, using $\lambda^{2}+\mu^{2}+\nu^{2}=1$ and $\lambda \partial_{\rho} \lambda+\mu \partial_{\rho} \mu+\nu \partial_{j} \nu=0$,

$$
2 f_{j i}=\partial_{j} p_{2}-\partial_{i} p_{j} .
$$

Thus we have
Theorem 2.3. Let $M^{2 n+1}$ be a differentaable manafold with an ( $f, g, u, v, w$, $\lambda, \mu, \nu)$-structure and suppose that the set ( $f, g, p$ ), $p$ being given by (2.2), defines an almost contact metric structure. In order for the almost contact metric structure $(f, g, p)$ to be contact, it is nec'essary and sufficient that the ( $f, g, u, v, w, \lambda$, $\mu, \nu)$-structure satisfies (2.14).

From Theorems 2.2 and 2.3, we have
Theorem 2.4. Let $M^{2 n+1}$ be a differentrable manifold with an ( $f, g, u, v, w$, $\lambda, \mu, \nu)$-structure and suppose that the set ( $f, g, p$ ), $p$ being given by (2.2), defines an almost contact metric structure. In order for the almost contact metric structure to be Sasakian, it is necessary and sufficient that the ( $f, g, u, v, w, \lambda, \mu, \nu$ )structure is normal and satisfies (2.14).

## §3. The case in which $\boldsymbol{p}$ vanishes identically.

Suppose that the vector field $p^{h}$ defined by (2.2) vanishes identically. Then from $\lambda u^{h}+\mu v^{h}+\nu w^{h}=0$, we have

$$
\begin{equation*}
\lambda=\mu=\nu=0 . \tag{3.1}
\end{equation*}
$$

Consequently equations (1.11), (1.12) and (1.13) reduce respectively to

$$
\begin{equation*}
u_{t} f_{2}^{t}=0, \quad v_{t} f_{2}^{t}=0, \quad w_{t} f_{2}^{t}=0 \tag{3.2}
\end{equation*}
$$

$$
\begin{equation*}
f_{t}^{h} u^{t}=0, \quad f_{t}^{h} v^{t}=0, \quad f_{t}^{h} w^{t}=0 \tag{3.3}
\end{equation*}
$$

and

$$
\begin{cases}u_{t} u^{t}=1, & u_{t} v^{t}=0,  \tag{3.4}\\ u_{t} w^{t}=0 \\ v_{t} v^{t}=1, & v_{t} w^{t}=0 \\ & w_{t} w^{t}=1\end{cases}
$$

Thus the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure reduces to the so-called framed $f$-structure ([4]).

In this case, we put

$$
\begin{equation*}
\varphi_{i}{ }^{h}=f_{\imath}^{h}+v_{\imath} w^{h}-w_{\imath} v^{h} . \tag{3.5}
\end{equation*}
$$

Then we can easily check that

$$
\begin{align*}
& \varphi_{i}^{t} \varphi_{t}^{h}=-\delta_{i}^{h}+u_{\imath} u^{h}  \tag{3.6}\\
& u_{t} \varphi_{i}^{t}=0, \quad \varphi_{t}^{h} u^{t}=0 \\
& \varphi_{j}^{t} \varphi_{i}^{s} g_{t s}=g_{j i}-u, u_{2} \tag{3.8}
\end{align*}
$$

Thus we have
Theorem 3.1. Let $M^{2 n+1}$ be a differentiable manifold with an ( $f, g, u, v, w$, $\lambda, \mu, \nu)$-structure and suppose that the vector field $p^{h}$ defined by (2.2) vanishes
identically. Then the manifold $M^{2 n+1}$ admits an almost contact metric structure ( $\varphi, g, u$ ), $\varphi_{i}{ }^{h}$ being given by (3.5).

The following theorem is proved in [3].
Theorem 3.2. Suppose that the assumptions in Theorem 3.1 hold. If the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure is normal, then the almost contact metric structure ( $\varphi, g, u$ ) is also normal.
§4. Submanifolds of codimension 3 of an almost Hermitian manifold admitting an almost contact metric structure.

Suppose that the set $(f, g, p)$ of $f_{2}{ }^{h}, g_{j i}$ and $p^{h}=\lambda u^{h}+\mu v^{h}+\nu w^{h}$ defines an almost contact metric structure, then we have (2.11) and consequently from (1.6)

$$
\begin{equation*}
F_{B}{ }^{A} B_{\imath}{ }^{B}=f_{\imath}{ }^{h} B_{h}{ }^{A}+p_{i} N^{A}, \tag{4.1}
\end{equation*}
$$

where

$$
\begin{equation*}
N^{A}=\lambda C^{A}+\mu D^{A}+\nu E^{A} \tag{4.2}
\end{equation*}
$$

is an intrinsically defined unit normal to $M^{2 n+1}$ because $C^{A}, D^{A}$ and $E^{A}$ are mutually orthogonal unit normals to $M^{2 n+1}$ and $\lambda^{2}+\mu^{2}+\nu^{2}=1$.

When a submanifold of an almost Hermitian manifold satisfies equation of the form (4.1), $N^{A}$ being a unit normal to the submanifold, we say that the submanifold is semi-invariant with respect to $N^{A}$ ([1], [9]). We call $N^{A}$ the distinguished normal to the semi-invariant submanifold.

We also have, from (1.7), (1.8) and (1.9),

$$
\begin{equation*}
F_{B}{ }^{A} N^{B}=-p^{h} B_{h}{ }^{A}, \tag{4.3}
\end{equation*}
$$

which shows that the transform of the distinguished normal $N^{A}$ by the almost complex structure tensor of the ambient manifold is tangent to $M^{2 n+1}$.

Conversely suppose that a submanifold $M^{2 n+1}$ of codimension 3 of an almost Hermitian manifold $M^{2 n+4}$ is semi-invariant with respect to a unit normal $N^{A}$ whose transform by $F$ is tangent to $M^{2 n+1}$. Then we have

$$
\begin{gather*}
F_{B}{ }^{A} B_{\imath}{ }^{B}=f_{\imath}{ }^{h} B_{h}{ }^{A}+q_{i} N^{A},  \tag{4.4}\\
F_{B}{ }^{A} N^{B}=-q^{h} B_{h}{ }^{A} \tag{4.5}
\end{gather*}
$$

for a vector field $q^{h}$ of $M^{2 n+1}$. Applying $F$ to (4.4) and using (4.4) and (4.5), we find

$$
-B_{\imath}{ }^{A}=f_{\imath}{ }^{t}\left(f_{t}^{h} B_{h}^{A}+q_{t} N^{A}\right)-q_{i} q^{h} B_{h}{ }^{A},
$$

$$
\text { ( } f, g, u, v, w, \lambda, \mu, \nu \text { )-STRUCTURES }
$$

from which

$$
f_{\imath}^{t} f_{t}^{h}=-\delta_{i}^{h}+q_{i} q^{h}, \quad q_{t} f_{\imath}^{t}=0 .
$$

Applying $F$ to (4.5) and using (4.4), we find

$$
-N^{A}=-q^{t}\left(f_{\iota}^{h} B_{h}^{A}+q_{t} N^{A}\right),
$$

from which

$$
f_{t}^{h} q^{t}=0, \quad q_{t} q^{t}=1
$$

We also have from (4.4)

$$
f_{j}^{t} f_{2}^{s} g_{t s}=g_{j i}-q_{j} q_{i}
$$

Thus we see that the set $(f, g, q)$ defines an almost contact metric structure.
Now comparing (4.4) with (1.6), we find

$$
\begin{equation*}
q_{i} N^{A}=u_{\imath} C^{A}+v_{i} D^{A}+w_{\imath} E^{A} \tag{4.6}
\end{equation*}
$$

from which, transvecting with $q^{2}$,

$$
\begin{equation*}
N^{A}=\alpha C^{A}+\beta D^{A}+\gamma E^{A} \tag{4.7}
\end{equation*}
$$

where

$$
\begin{equation*}
\alpha=u_{t} q^{t}, \quad \beta=v_{t} q^{t}, \quad \gamma=w_{t} q^{t} . \tag{4.8}
\end{equation*}
$$

Thus we have

$$
\begin{equation*}
\alpha^{2}+\beta^{2}+\gamma^{2}=1 \tag{4.9}
\end{equation*}
$$

$N^{A}$ being a unit normal.
Substituting (4.7) into (4.6), we find

$$
\left(u_{i}-\alpha q_{i}\right) C^{A}+\left(v_{i}-\beta q_{i}\right) D^{A}+\left(w_{i}-\gamma q_{i}\right) E^{A}=0,
$$

from which
(4.10)

$$
u_{i}=\alpha q_{i}, \quad v_{i}=\beta q_{i}, \quad w_{i}=\gamma q_{i}
$$

or, using (4.9)
(4.11)

$$
q_{i}=\alpha u_{i}+\beta v_{i}+\gamma w_{i} .
$$

Transvecting (4.6) with $u^{2}$ and using (1.13) and (4.8), we find

$$
\alpha N^{A}=\left(1-\mu^{2}-\nu^{2}\right) C^{A}+\lambda \mu D^{A}+\lambda \nu E^{A} .
$$

Comparing this equation with (4.7), we obtain

$$
\begin{equation*}
\alpha^{2}=1-\mu^{2}-\nu^{2}, \quad \alpha \beta=\lambda \mu, \quad \alpha \gamma=\lambda \nu . \tag{4.12}
\end{equation*}
$$

Similarly we have

$$
\begin{equation*}
\beta^{2}=1-\nu^{2}-\lambda^{2}, \quad \gamma^{2}=1-\lambda^{2}-\mu^{2}, \quad \beta \gamma=\mu \nu . \tag{4.13}
\end{equation*}
$$

Thus

$$
\alpha^{2}+\beta^{2}+\gamma^{2}=3-2\left(\lambda^{2}+\mu^{2}+\nu^{2}\right),
$$

from which, using (4.9),

$$
\begin{equation*}
\lambda^{2}+\mu^{2}+\nu^{2}=1 . \tag{4.14}
\end{equation*}
$$

Consequently equations (4.12) and (4.13) give
which show that

$$
\alpha= \pm \lambda, \quad \beta= \pm \mu, \quad \gamma= \pm \nu .
$$

Thus (2.2) and (4.11) give $q_{i}= \pm p_{2}$. Thus we have
Theorem 4.1. In order for a submanifold $M^{2 n+1}$ of codimension 3 of an almost Hermitian manifold $M^{2 n+4}$ with structure tensor $F$ and $G$ to admit an almost contact metric structure $(f, g, q), f$ and $g$ being the tensor field of type $(1,1)$ and the Riemannian metric tensor induced from $F$ and $G$ of $M^{2 n+4}$ respectively, it is necessary and sufficient that the submanifold $M^{2 n+1}$ is semi-invariant with respect to a unit normal vector field whose transform by $F$ is tangent to the submanifold. Moreover, in this case the almost contact metric structure ( $f, g, q$ ) coincides with ( $f, g, p$ ) stated in Theorem 2.1.

Now suppose that the condition $\lambda^{2}+\mu^{2}+\nu^{2}=1$ in Theorem 2.1 is satisfied and take $N^{A}=\lambda C^{A}+\mu D^{A}+\nu E^{A}$ as $C^{A}$. Then we have $\lambda=1, \mu=0, \nu=0$ and consequently $u^{h}=p^{h}, v_{i}=0, w_{i}=0$ because of (1.13) and (2.2). Thus (1.6)~(1.9) become respectively

$$
\begin{equation*}
F_{B}{ }^{A} B_{\imath}{ }^{B}=f_{\imath}{ }^{n} B_{n}{ }^{A}+p_{i} C^{A}, \tag{4.15}
\end{equation*}
$$

$$
\begin{equation*}
F_{B}{ }^{A} C^{B}=-p^{h} B_{h}{ }^{A}, \tag{4.16}
\end{equation*}
$$

$$
\begin{equation*}
F_{B}^{A} D^{B}=-E^{A} \tag{4.17}
\end{equation*}
$$

$$
\begin{equation*}
F_{B}^{A} E^{B}=D^{A} \tag{4.18}
\end{equation*}
$$

$$
\begin{aligned}
& \alpha^{2}=\lambda^{2}, \quad \beta^{2}=\mu^{2}, \quad \gamma^{2}=\nu^{2}, \\
& \beta \gamma=\mu \nu, \quad \gamma \alpha=\nu \lambda, \quad \alpha \beta=\lambda \mu,
\end{aligned}
$$

Thus we have
Theorem 4.2. Let $M^{2 n+1}$ be a submanfold of codimension 3 of an almost Hermitian manifold $M^{2 n+4}$ with structure tensor $F$ and $G$ and suppose that $M^{2 n+1}$ admıts an almost contact metric structure ( $f, g, p$ ), $f$ and $g$ being tensors induced from $F$ and $G$ respectively. Then there exists, in the normal bundle, a holomorphic plane which is invariant by $F$.

Now denoting by $\nabla$, the operator of van der Waerden-Bortolotti covariant differentiation with respect to $g_{j i}$, we have equations of Gauss for $M^{2 n+1}$ of $M^{2 n+4}$

$$
\begin{equation*}
\nabla, B_{\imath}{ }^{A}=h_{j 2} C^{A}+k_{j i} D^{A}+l_{j i} E^{A}, \tag{4.19}
\end{equation*}
$$

where $h_{j i}, k_{j i}, l_{j i}$ are the second fundamental tensors with respect to normals $C^{A}, D^{A}, E^{A}$ respectively. The mean curvature vector is then given by

$$
\begin{equation*}
\frac{1}{2 n+1} g^{j i} \nabla_{j} B_{2}{ }^{A}=\frac{1}{2 n+1}\left(h_{t}{ }^{t} C^{A}+k_{t}{ }^{t} D^{A}+l_{t}{ }^{t} E^{A}\right), \tag{4.20}
\end{equation*}
$$

where

$$
h_{t}{ }^{t}=g^{j i} h_{j i}, \quad k_{t}{ }^{t}=g^{j i} k_{j i}, \quad l_{t}^{t}=g^{j i} l_{j i},
$$

$g^{j i}$ being the contravariant components of the metric tensor.
The equations of Weingarten are given by

$$
\begin{align*}
& \nabla_{j} C^{A}=-h_{\jmath}{ }^{h} B_{h}{ }^{A}+l_{\jmath} D^{A}+m_{\jmath} E^{A},  \tag{4.21}\\
& \nabla_{\jmath} D^{A}=-k_{\jmath}{ }^{h} B_{h}{ }^{A}-l_{j} C^{A} \quad+n_{\jmath} E^{A},  \tag{4.22}\\
& \nabla_{\jmath} E^{A}=-l_{\jmath}{ }^{h} B_{h}{ }^{A}-m_{j} C^{A}-n_{\jmath} D^{A}, \tag{4.13}
\end{align*}
$$

where $h_{\jmath}{ }^{h}=h_{j t} g^{t h}, \quad k_{j}{ }^{h}=k_{j t} g^{t h}, l_{\jmath}^{h}=l_{j t} g^{t h}, l_{j}, m_{j}$ and $n$, being the third fundamental tensors.

In the sequel, we denote the normal components of $\nabla_{j} C$ by $\nabla_{j}^{\perp} C$. The normal vector field $C$ is said to be parallel in the normal bundle if we have $\nabla_{j}^{\perp} C=0$, that is, $l_{j}$ and $m$, vanish identically.

We now assume that $M^{2 n+4}$ is Kaehlerian and differentiate (4.15) covariantly along $M^{2 n+1}$. We then have

$$
\begin{aligned}
F_{B}^{A}\left(h_{\jmath i} C^{B}+k_{j i} D^{B}+l_{j i} E^{B}\right)= & \left(\nabla_{\jmath} f_{\imath}{ }^{h}\right) B_{h}{ }^{A}+f_{\imath}{ }^{t}\left(h_{j t} C^{A}+k_{j t} D^{A}+l_{\jmath t} E^{A}\right) \\
& +\left(\nabla_{\jmath} p_{\imath}\right) C^{A}+p_{i}\left(-h_{\jmath}{ }^{h} B_{h}{ }^{A}+l_{\jmath} D^{A}+m_{\jmath} E^{A}\right),
\end{aligned}
$$

from which, using (4.16) $\sim(4.18)$,

$$
\begin{equation*}
\nabla_{\jmath} f_{\imath}^{h}=-h_{j i} p^{h}+h_{\jmath}^{h} p_{i}, \tag{4.24}
\end{equation*}
$$

$$
\begin{gather*}
\nabla_{\jmath} p_{i}=-h_{j t} f_{\imath}^{t},  \tag{4.25}\\
k_{j i}=-l_{j t} f_{\imath}^{t}-m_{\rho} p_{i},  \tag{4.26}\\
l_{j i}=k_{j t} f_{2}^{t}+l_{\jmath} p_{i} . \tag{4.27}
\end{gather*}
$$

The last two relations give

$$
\begin{gather*}
k_{j t} p^{t}=-m_{\jmath},  \tag{4.28}\\
l_{j t} p^{t}=l_{\jmath}, \\
k_{t}^{t}=-m_{t} p^{t},  \tag{4.30}\\
l_{t}^{t}=l_{t} p^{t} . \tag{4.31}
\end{gather*}
$$

Transvecting (4.27) with $f_{k}{ }^{J}$ and using (4.26), we find

$$
-k_{i k}-m_{\imath} p_{k}=k_{s t} f_{\imath}^{t} f_{k}^{s}+\left(f_{k}^{t} l_{t}\right) p_{i},
$$

from which, taking the skew-symmetric part with respect to $\imath$ and $k$,

$$
-m_{\imath} p_{k}+m_{k} p_{i}=p_{i}\left(l_{t} f_{k}^{t}\right)-p_{k}\left(l_{t} f_{\imath}^{t}\right),
$$

or, transvecting with $p^{k}$ and using (4.30)

$$
\begin{equation*}
l_{t} f_{\imath}{ }^{t}=k_{t}{ }^{t} p_{i}+m_{\imath} . \tag{4.32}
\end{equation*}
$$

If we transvect (4.32) with $l^{i}$ and make use of (4.31), then we have

$$
\begin{equation*}
k_{t}{ }^{t} l_{s}^{s}+m_{t} l^{t}=0 \tag{4.33}
\end{equation*}
$$

Transvecting (4.26) with $l_{k}{ }^{2}$ and substituting (4.27), we find

$$
k_{j t} l_{k}^{t}=-\left(l_{\rho s} f_{t}^{s}+m, p_{t}\right)\left(k_{k r} f^{t r}+l_{k} p^{t}\right),
$$

or, using (4.28) and (4.29) and remembering (2.6) $\sim(2.8)$,

$$
\begin{equation*}
k_{j t} l_{\imath}{ }^{t}+k_{i t} l_{j}{ }^{t}=-\left(l_{j} m_{i}+l_{\imath} m_{j}\right) . \tag{4.34}
\end{equation*}
$$

If we transvect (4.27) with $l_{k}{ }^{2}$ and substitute (4.26), we have

$$
l_{j t} l_{k}^{t}=k_{j t}\left(k_{k}{ }^{t}+m_{k} p^{t}\right)+l_{j}\left(l_{k t} p^{t}\right)
$$

from which, using (4.28) and (4.29),

$$
\begin{equation*}
l_{j t} l_{\imath}{ }^{t}-k_{j t} k_{\imath}{ }^{t}=l_{\jmath} l_{i}-m, m_{\imath} . \tag{4.35}
\end{equation*}
$$

$$
\text { ( } f, g, u, v, w, \lambda, \mu, \nu) \text {-STRUCTURES }
$$

Now suppose that the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure and consequently ( $f, g, p$ )-structure is normal, that is,

$$
f_{J}^{t} \nabla_{t} f_{2}{ }^{h}-f_{2}{ }^{t} \nabla_{t} f_{j}{ }^{h}-\left(\nabla_{J} f_{2}{ }^{t}-\nabla_{2} f_{j}{ }^{t}\right) f_{t}{ }^{h}+\left(\nabla_{j} p_{i}-\nabla_{2} p_{j}\right) p^{h}=0 .
$$

Substituting (4.24) and (4.25) into this equation, we find

$$
\left(f_{j}{ }^{t} h_{t}{ }^{h}-h_{j}{ }^{t} f_{t}{ }^{h}\right) p_{i}+\left(f_{\imath}{ }^{t} h_{t}{ }^{h}-h_{\imath}{ }^{t} f_{t}{ }^{h}\right) p_{j}=0
$$

and consequently

$$
f_{J}{ }^{t} h_{t}{ }^{h}-h_{J}{ }^{t} f_{t}{ }^{h}=p_{j} q^{h}
$$

for a certain vector field $q^{h}$. From these two equations, we have $q^{h}=0$, and consequently

$$
\begin{equation*}
f_{J}^{t} h_{t}{ }^{h}=h_{J}^{t} f_{t}{ }^{h} . \tag{4.36}
\end{equation*}
$$

Thus we have
Theorem 4.3. Suppose that the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure induced on a submanifold $M^{2 n+1}$ of codimension 3 of a Kaehlerian manifold $M^{2 n+4}$ satisfies $\lambda^{2}+\mu^{2}+\nu^{2}=1$ and consequently ( $f, g, p$ ) defines an almost contact metric structure. Then in order for these structures to be normal, it is necessary and sufficient that the second fundamental tensor $h$ with respect to the distinguished normal and $f$ commute.

Now suppose that the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure satisfies $\lambda^{2}+\mu^{2}+\nu^{2}=1$ and the almost contact metri: structure ( $f, g, p$ ) is contact, that is,

$$
\nabla_{j} p_{i}-\nabla_{\imath} p_{j}=2 f_{j i} .
$$

Then we substitute (4.25) into this equation and get

$$
\begin{equation*}
h_{\imath}{ }^{t} f_{t}{ }^{h}+f_{\imath}{ }^{t} h_{t}{ }^{h}=2 f_{\imath}{ }^{h} . \tag{4.37}
\end{equation*}
$$

From (4.36) and (4.37) we have

$$
\begin{equation*}
h_{\imath}{ }^{t} f_{t}{ }^{h}=f_{\imath}{ }^{h} \text {, } \tag{4.38}
\end{equation*}
$$

from which, transvecting with $p^{2}$, we get $\left(h_{\imath}{ }^{t} p^{i}\right) f_{t}{ }^{h}=0$, which shows that $h_{2}{ }^{t} p^{2}=\alpha p^{t}$, where $\alpha=h_{j i} p^{j} p^{2}$.

Transvecting (4.38) with $f_{h}{ }^{k}$, we find

$$
h_{\imath}{ }^{t}\left(-\delta_{t}^{k}+p_{t} p^{k}\right)=-\delta_{i}^{k}+p_{\imath} p^{k},
$$

or equivalently

$$
\begin{equation*}
h_{j i}=g_{\jmath i}+(\alpha-1) p_{J} p_{i} . \tag{4.39}
\end{equation*}
$$

In this case we say that the submanifold $M^{2 n+1}$ is $p$-umbilical with respect to the distinguished normal $C^{A}$. The converse being evident, we have

Theorem 4.4. Suppose that the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure induced on the submanifold $M^{2 n+1}$ of codimension 3 of a Kaehlerian manifold $M^{2 n+4}$ satisfies $\lambda^{2}+\mu^{2}+\nu^{2}=1$ and consequently ( $f, g, p$ ) defines an almost contact metric structure. In order for the almost contact metric structure ( $f, g, p$ ) to be Sasakian, it is necessary and sufficient that $M^{2 n+1}$ is $p$-umbilical with respect to the distingurshed normal $C^{A}$.
§ 5. Submanifolds of codimension 3 of an even-dimensional Euclidean space admitting an almost contact metric structure.

In this section we assume that the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure induced on a submanifold $M^{2 n+1}$ of codimension 3 of an even-dimensional Euclidean space $E^{2 n+4}$ satisfies $\lambda^{2}+\mu^{2}+\nu^{2}=1$ and consequently ( $f, g, p$ ) defines an almost contact metric structure.

Then equations of Gauss are given by

$$
\begin{equation*}
K_{k j i}{ }^{h}=h_{k}{ }^{h} h_{j i}-h_{\jmath}{ }^{h} h_{k i}+k_{k}{ }^{h} k_{j i}-k_{\jmath}{ }^{h} k_{k i}+l_{k}{ }^{h} l_{j i}-l_{\jmath}{ }^{h} l_{k i}, \tag{5.1}
\end{equation*}
$$

where $K_{k j i}{ }^{h}$ is the Riemann-Christoffel curvature tensor of $M^{2 n+1}$, those of Codazzi by

$$
\begin{align*}
& \nabla_{k} h_{j i}-\nabla_{j} h_{k i}-l_{k} k_{j i}+l_{j} k_{k i}-m_{k} l_{j i}+m_{\jmath} l_{k i}=0,  \tag{5.2}\\
& \nabla_{k} k_{j i}-\nabla_{j} k_{k i}+l_{k} h_{j i}-l_{\jmath} h_{k i}-n_{k} l_{j i}+n_{\jmath} l_{k i}=0,  \tag{5.3}\\
& \nabla_{k} l_{j i}-\nabla_{\jmath} l_{k i}+m_{k} h_{j i}-m_{\rho} h_{k i}+n_{k} k_{j i}-n_{j} k_{k i}=0, \tag{5.4}
\end{align*}
$$

and those of Ricci by

$$
\begin{align*}
& \nabla_{k} l_{\jmath}-\nabla_{\jmath} l_{k}+h_{k}{ }^{t} k_{j t}-h_{\jmath}{ }^{t} k_{k t}+m_{k} n_{\jmath}-m_{\jmath} n_{k}=0,  \tag{5.5}\\
& \nabla_{k} m_{\jmath}-\nabla_{\jmath} m_{k}+h_{k}{ }^{t} l_{j t}-h_{\jmath}{ }^{t} l_{k t}+n_{k} l_{\jmath}-n_{\jmath} l_{k}=0,  \tag{5.6}\\
& \nabla_{k} n_{\jmath}-\nabla_{\jmath} n_{k}+k_{k}{ }^{t} l_{j t}-k_{\jmath}{ }^{t} l_{k t}+l_{k} m_{\jmath}-l_{\jmath} m_{k}=0 . \tag{5.7}
\end{align*}
$$

We first prove
Lemma 5.1. Suppose that $M^{2 n+1}$ is a submanifold of codimension 3 with ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure of an even-dimensional Euclidean space $E^{2 n+4}$ satisfyng $\lambda^{2}+\mu^{2}+\nu^{2}=1$. Then in order for the submanifold $M^{2 n+1}$ to be umbilical with respect to the distinguished normal, that is, choosing $C^{A}$ as the distinguished normal,

$$
\begin{equation*}
h_{j i}=\rho g_{j i}, \quad k_{t}{ }^{t}=0, \quad l_{t}^{t}=0, \tag{5.8}
\end{equation*}
$$

it is necessary and sufficient that the distingurshed normal $C^{A}$ is concurrent. In this case the submanrfold $M^{2 n+1}$ is pseudo-umbilical and the mean curvature is constant.

Proof. Suppose that (5.8) is satisfied. Then (4.30) $\sim(4.33)$ imply that

$$
\begin{equation*}
l_{t} p^{t}=m_{t} p^{t}=l_{t} m^{t}=0 \tag{5.9}
\end{equation*}
$$

and (4.25) becomes $\nabla, p_{i}=\rho f_{j i}$, which shows that

$$
\nabla_{k} \nabla_{j} p_{i}=\left(\nabla_{k} \rho\right) f_{j i}+\rho \nabla_{k} f_{j i}
$$

Substituting (4.24) into this and taking account of (5.8), we obtain

$$
\nabla_{k} \nabla_{j} p_{i}=\left(\nabla_{k} \rho\right) f_{j i}+\rho^{2}\left(g_{k \imath} p_{j}-g_{j k} p_{\imath}\right),
$$

from which, using the Ricci identity,

$$
-K_{k j i}^{h} p_{h}=\left(\nabla_{k} \rho\right) f_{j i}-\left(\nabla_{j} \rho\right) f_{k \imath}+\rho^{2}\left(g_{k \imath} p_{j}-g_{j i} p_{k}\right) .
$$

From this, using the Bianchi identity, we find

$$
\begin{equation*}
\left(\nabla_{k} \rho\right) f_{j i}+\left(\nabla_{\jmath} \rho\right) f_{2 k}+\left(\nabla_{\imath} \rho\right) f_{k \jmath}=0 \tag{5.10}
\end{equation*}
$$

Transvecting (5.10) with $p^{k} f^{j i}$, we get $\left(\nabla_{t} \rho\right) p^{t}=0$. Moreover, transvection of (5.10) with $f^{j i}$ yields

$$
2 n \nabla_{k} \rho+2\left(\nabla_{j} \rho\right)\left(-\delta_{k}^{\jmath}+p_{k} p^{\jmath}\right)=0 .
$$

Therefore we see $\rho$ that is constant. Thus (5.2) reduces to

$$
l_{k} k_{j i}-l_{j} k_{k i}+m_{k} l_{j i}-m_{j} l_{k i}=0 .
$$

If we transvect $p^{k}$ to this and make use of (4.28), (4.29) and (5.9), then we have $l_{,} m_{\imath}-m_{\rho} l_{i}=0$. Thus it follows that $l_{j}=m_{j}=0$, that is, $\nabla_{j}^{\perp} C^{A}=0$, because of $l_{t} m^{t}=0$. From this fact and (4.21) we verify that $\nabla_{j} C^{A}=\rho B_{j}{ }^{A}$.

Conversely if the distinguished normal $C^{A}$ to $M^{2 n+1}$ is concurrent, that is, $\nabla, C^{A}=\tau B{ }_{\jmath}{ }^{A}$ for some function $\tau$, then we have from (4.21),

$$
h_{i i}=\tau g_{j i}, \quad l_{j}=m_{j}=0,
$$

which show that

$$
k_{t}{ }^{t}=l_{t}{ }^{t}=0
$$

because of (4.30) and (4.31). Consequently the distinguished normal $C^{A}$ is in the direction of the mean curvature vector $H^{A}$. From $h_{j i}=\tau g_{j i}$, we see that
$\rho=\tau=\frac{1}{2 n+1} h_{t}{ }^{t}$. Thus $M^{2 n+1}$ is pseudo-umbilical. This completes the proof of the lemma.

We now assume that the assumptions of Lemma 5.1 hold. Then (4.24) and (4.25) become

$$
\begin{gathered}
\nabla_{\jmath} f_{\imath}{ }^{h}=\rho\left(-g_{j i} p^{h}+\delta_{j}^{h} p_{\imath}\right), \\
\nabla_{J} p_{i}=\rho f_{j i} .
\end{gathered}
$$

Thus the set $(f, g, p)$ defines a Sasakian structure if $\rho \neq 0$. We may consider $\rho=1$ because $\rho$ is a constant.

On the other hand, we see from (4.15) and (4.16) that the direct sum of the tangent space of $M^{2 n+1}$ and $C^{4}$ is invariant. Then the ambient space being Euclidean, $M^{2 n+1}$ is an intersection of a complex cone with generator $C^{A}$ and a $(2 n+3)$-dimensional sphere. Thus we have

Theorem 5.2. Let $M^{2 n+1}$ be a pseudo-umbilical submanıfold of an even-dimen slonal Euclidean space $E^{2 n+4}$ with ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure satisfying $\lambda^{2}+\mu^{2}+\nu^{2}=1$. Then $M^{2 n+1}$ is an intersection of a complex cone with generator $C^{A}$ and a sphere.

We suppose that the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure induced on a submanifold $M^{2 n+1}$ of codimension 3 of $E^{2 n+4}$ defines a normal almost contact metric structure $(f, g, p)$ and the distinguished normal $C^{A}$ is parallel in the normal bundle of $M^{2 n+1}$. Then (4.36) holds, that is,

$$
\begin{equation*}
h_{j t} f_{k}^{t}+h_{k t} f_{j}=0 \tag{5.11}
\end{equation*}
$$

Transvecting (5.11) with $f_{2}{ }^{k}$, we have

$$
h_{j t}\left(-\delta_{i}^{t}+p_{\imath} p^{t}\right)+h_{s t} f_{j}^{t} f_{\imath}^{s}=0,
$$

from which, taking the skew-symmetric part,

$$
\left(h_{j t} p^{t}\right) p_{i}-\left(h_{i t} p^{t}\right) p_{j}=0,
$$

which shows that

$$
\begin{equation*}
h_{j t} p^{t}=\alpha p_{g}, \tag{5.12}
\end{equation*}
$$

where $\alpha=h_{t s} p^{t} p^{s}$.
Differentiating (5.12) covariantly and substituting (4.25), we find

$$
\left(\nabla_{k} h_{j t}\right) p^{t}+h_{\jmath}{ }^{t}\left(-h_{k s} f_{t}{ }^{s}\right)=\left(\nabla_{k} \alpha\right) p_{j}-\alpha h_{k t} f_{j}^{t},
$$

from which, taking the skew-symmetric part and using (5.11)

$$
\left(\nabla_{k} h_{j t}-\nabla_{j} h_{k t}\right) p^{t}+2 h_{j}{ }^{t} h_{t s} f_{k}^{s}=\left(\nabla_{k} \alpha\right) p_{j}-\left(\nabla_{j} \alpha\right) p_{k}+2 \alpha h_{j t} f_{k}{ }^{t} .
$$

$$
(f, g, u, v, w, \lambda, \mu, \nu) \text {-STRUCTURES }
$$

On the other hand, we have from the fact that $\nabla_{\rho}^{\perp} C^{A}=0$ and (5.2)

$$
\begin{equation*}
\nabla_{k} h_{j i}-\nabla_{j} h_{k i}=0 . \tag{5.13}
\end{equation*}
$$

Thus we have

$$
\begin{equation*}
2 h_{\jmath}{ }^{t} h_{t s} f_{k}{ }^{s}=\left(\nabla_{k} \alpha\right) p_{\jmath}-\left(\nabla_{j} \alpha\right) p_{k}+2 \alpha h_{j t} f_{k}{ }^{t} . \tag{5.14}
\end{equation*}
$$

Transvecting (5.14) with $p^{3}$ and using (5.12), we get

$$
\begin{equation*}
\nabla_{j} \alpha=A p_{j}, \tag{5.15}
\end{equation*}
$$

for a certain scalar $A$. Thus (5.14) gives

$$
h_{\jmath}{ }^{t} h_{t s} f_{k}^{s}=\alpha h_{j t} f_{k}{ }^{t} .
$$

If we transvect this with $f_{2}{ }^{k}$ and use (5.12), then we get

$$
\begin{equation*}
h_{j t} h_{\imath}{ }^{t}=\alpha h_{j i} . \tag{5.16}
\end{equation*}
$$

Differentiating (5.15) covariantly and substituting (4.25), we find

$$
\nabla_{k} \nabla_{j} \alpha=\left(\nabla_{k} A\right) p_{j}-A h_{k t} f_{j}{ }^{t},
$$

from which, using (5.11),

$$
\left(\nabla_{k} A\right) p_{\jmath}-\left(\nabla_{j} A\right) p_{k}+2 A h_{j t} f_{k}^{t}=0
$$

which implies that

$$
\nabla_{k} A=\left(p^{t} \nabla_{t} A\right) p_{k}
$$

The last two equations mean that

$$
A h_{j t} f_{k}^{t}=0
$$

Transvecting $f_{2}{ }^{k}$ to this and using (5.12), we have

$$
\begin{equation*}
A\left(h_{j i}-\alpha p_{j} p_{\imath}\right)=0 . \tag{5.17}
\end{equation*}
$$

On the other hand, we can prove, using (5.13) and (5.16) with $\alpha=$ const. that ([5])

$$
\begin{equation*}
\nabla_{k} h_{j i}=0 . \tag{5.18}
\end{equation*}
$$

We now assume that $M^{2 n+1}$ is complete and locally irreducible. Then we have from (5.18)

$$
\begin{equation*}
h_{j i}=B g_{j i} \tag{5.19}
\end{equation*}
$$

for a certain scalar $B$. From this and (5.16) we see that

$$
\begin{equation*}
B^{2}=\alpha B \tag{5.20}
\end{equation*}
$$

But if $h_{j i}=\alpha p_{\jmath} p_{2}$ or $h_{j i}=0$, then we see from (4.25) that $p^{h}$ is a parallel vector field and consequently

$$
K_{k j i}{ }^{h} p^{2}=0,
$$

which contradicts the fact that $M^{2 n+1}$ is locally irreducible.
Thus we see from (5.15) and (5.17) that $\alpha$ is a constant and hence from (5.19) and (5.20) that $\alpha=B \neq 0$. Thus (5.19) becomes

$$
h_{j i}=\alpha g_{j i} .
$$

According to Theorem 5.2, we have
Theorem 5.3. Let $M^{2 n+1}$ be a complete and locally rrreducible submantfold of codimension 3 of a Euclidean space $E^{2 n+4}$ such that the distingurshed normal $C^{A}$ is parallel in the normal bundle and the ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure defines a normal almost contact metric structure ( $f, g, p$ ), $p$ being given by (2.2). Then we have the same conclusion as that of Theorem 5.2.

We now prove
Lemma 5.4. Let $M^{2 n+1}$ be a submanıfold of codimension 3 with ( $f, g, u, v$, $w, \lambda, \mu, \nu$ )-structure of a Euclidean space $E^{2 n+4}$ satısfying $\lambda^{2}+\mu^{2}+\nu^{2}=1$. If the third fundamental tensors satisfy

$$
\begin{equation*}
\nabla_{j} n_{\imath}-\nabla_{\imath} n_{j}=2 \beta f_{j i}, \tag{5.21}
\end{equation*}
$$

for a certain scalar $\beta$ and $l_{j}=m_{j}=0$, then we have $\beta=0$.
Proof. Since $l_{j}=m_{j}=0$, we have, from (4.34), (5.7) and (5.21),

$$
\begin{equation*}
\beta f_{j i}+k_{j t} l_{2}{ }^{t}=0 \tag{5.22}
\end{equation*}
$$

Transvecting (5.22) with $f_{k}{ }^{2}$, we find

$$
\beta\left(g_{\jmath k}-p_{J} p_{k}\right)+k_{J}{ }^{t} l_{i t} f_{k}{ }^{2}=0,
$$

or, using (4.27) with $l_{\rho}=0$,

$$
\begin{equation*}
k_{j}{ }^{t} k_{i t}=\beta\left(g_{j i}-p, p_{i}\right), \tag{5.23}
\end{equation*}
$$

$$
(f, g, u, v, w, \lambda, \mu, \nu) \text {-STRUCTURES }
$$

from which

$$
\begin{equation*}
k_{j i} k^{j i}=2 n \beta . \tag{5.24}
\end{equation*}
$$

We prove first that $\beta$ is a constant. In fact, if we differentiate (5.21) covariantly and substitute (4.24), then we have

$$
\nabla_{k} \nabla_{j} n_{\imath}-\nabla_{k} \nabla_{2} n_{j}=2\left(\nabla_{k} \beta\right) f_{j i}+2 \beta\left(-h_{k} p_{i}+h_{k \imath} p_{j}\right) .
$$

Using the Ricci identity, we have

$$
-\left(K_{k j i}{ }^{h}+K_{j i k}{ }^{h}+K_{i k \jmath}{ }^{h}\right) n_{h}=2\left[\left(\nabla_{k} \beta\right) f_{j i}+\left(\nabla_{\jmath} \beta\right) f_{i k}+\left(\nabla_{\imath} \beta\right) f_{k \jmath}\right] \text {, }
$$

which shows that

$$
\left(\nabla_{k} \beta\right) f_{j i}+\left(\nabla_{\jmath} \beta\right) f_{i k}+\left(\nabla_{\imath} \beta\right) f_{k j}=0
$$

Thus as in the proof of Lemma 5.1, we can easily see that $\beta$ is constant.
Differentiating (5.23) covariantly, we have

$$
\begin{equation*}
\left(\nabla_{k} k_{j}^{t}\right) k_{i t}+k_{j}^{t}\left(\nabla_{k} k_{i t}\right)=-\beta\left[\left(\nabla_{k} p_{j}\right) p_{i}+p_{j}\left(\nabla_{k} p_{i}\right)\right], \tag{5.25}
\end{equation*}
$$

from which, taking the skew-symmetric part with respect to $k$ and $j$,

$$
\begin{aligned}
& \left(\nabla_{k} k_{j t}-\nabla_{j} k_{k t}\right) k_{\imath}{ }^{t}+k_{j}{ }^{t}\left(\nabla_{k} k_{i t}\right)-k_{k}{ }^{t}\left(\nabla_{j} k_{i t}\right) \\
= & -\beta\left[\left(\nabla_{k} p_{j}-\nabla_{j} p_{k}\right) p_{i}+\left(\nabla_{k} p_{i}\right) p_{j}-\left(\nabla_{j} p_{i}\right) p_{k}\right],
\end{aligned}
$$

from which, substituting (4.25) and (5.3) with $l_{j}=0$,

$$
\begin{gathered}
\left(n_{k} l_{j t}-n_{\jmath} l_{k t}\right) k_{\imath}{ }^{t}+k_{\jmath}{ }^{t}\left(\nabla_{\imath} k_{k t}+n_{k} l_{i t}-n_{\imath} l_{k t}\right)-k_{k}^{t}\left(\nabla_{\imath} k_{j t}+n_{\jmath} l_{i t}-n_{\imath} l_{j t}\right) \\
=\beta\left[\left(h_{k t} f_{\jmath}{ }^{t}-h_{j t} f_{k}^{t}\right) p_{i}+\left(h_{k t} f_{\imath}{ }^{t}\right) p_{\jmath}-\left(h_{j t} f_{\imath}{ }^{t}\right) p_{k}\right],
\end{gathered}
$$

or, using (4.34) with $l_{j}=m_{j}=0$,

$$
\begin{gathered}
k_{\jmath}^{t}\left(\nabla_{i} k_{k t}\right)-k_{k}{ }^{t}\left(\nabla_{2} k_{J t}\right)-2 n_{\imath} k_{\jmath}{ }^{t} l_{k t} \\
=\beta\left[\left(h_{k t} f_{\jmath}^{t}-h_{j t} f_{k}^{t}\right) p_{i}+\left(h_{k t} f_{\imath} t\right) p_{\jmath}-\left(h_{j t} f_{\imath}^{t}\right) p_{k}\right] .
\end{gathered}
$$

Interchanging the indices $k$ and $i$, we have

$$
\begin{gather*}
k_{j}^{t}\left(\nabla_{k} k_{i t}\right)-k_{2}{ }^{t}\left(\nabla_{k} k_{j t}\right)-2 n_{k} k_{J}{ }^{t} l_{i t}  \tag{5.26}\\
=\beta\left[\left(h_{i t} f_{j}{ }^{t}-h_{j t} f_{\imath}{ }^{t}\right) p_{k}+\left(h_{i t} f_{k}^{t}\right) p_{j}-\left(h_{j t} f_{k}^{t}\right) p_{i}\right] .
\end{gather*}
$$

Adding (5.25) and (5.26) and using (4.25), we find

$$
\begin{gather*}
2 k_{\jmath} \nabla_{k} k_{i t}-2 n_{k} k_{\jmath}^{t} l_{i t}  \tag{5.27}\\
=\beta\left[\left(h_{i t} f_{\jmath}^{t}-h_{j t} f_{v}^{t}\right) p_{k}+\left(h_{k t} f_{\jmath}^{t}-h_{j t} f_{k}^{t}\right) p_{i}+\left(h_{i t} f_{k}{ }^{t}+h_{k t} f_{v}^{t}\right) p_{\jmath}\right] .
\end{gather*}
$$

Transvecting (5.3) with $g^{k 2}$ and using the fact that $l_{j}=0$ and $k_{t}{ }^{t}=l_{t}{ }^{t}=0$, we find

$$
\begin{equation*}
\nabla^{t} k_{j t}=l_{j t} n^{t} . \tag{5.28}
\end{equation*}
$$

Thus, by transvecting (5.27) with $g^{k 2}$, we get

$$
\begin{equation*}
\beta h_{s t} p^{s} f_{\nu}^{t}=0 . \tag{5.29}
\end{equation*}
$$

If we transvect (5.27) with $p^{j}$ and make use of (5.29), we obtain

$$
\begin{equation*}
\beta\left[h_{i t} f_{k}{ }^{t}+h_{k t} f_{\imath}{ }^{t}\right]=0 . \tag{5.30}
\end{equation*}
$$

Hence, (5.27) becomes

$$
\begin{equation*}
k_{J}{ }^{t} \nabla_{k} k_{i t}-n_{k} k_{J}{ }^{t} l_{i t}=\beta\left[\left(h_{i t} f_{j}\right) p_{k}+\left(h_{k t} f_{j}\right) p_{i}\right] . \tag{5.31}
\end{equation*}
$$

On the other hand, differentiating (4.28) with $m_{j}=0$ covariantly and substituting (4.25), we find

$$
\left(\nabla_{k} k_{j t}\right) p^{t}=k_{j}{ }^{t} h_{k s} f_{t}^{s},
$$

or, using (4.27) with $l_{j}=0$,

$$
\begin{equation*}
\left(\nabla_{k} k_{j t}\right) p^{t}=-l_{j t} h_{k}{ }^{t} . \tag{5.32}
\end{equation*}
$$

Transvecting (5.31) with $p^{2}$ and taking account of (4.29) with $l_{j}=0$, (5.29) and (5.32), we find

$$
-k_{J}{ }^{t} l_{k s} h_{t}{ }^{s}=\beta h_{k t} f_{j}{ }^{t},
$$

from which, using (4.34) with $l_{j}=0, \beta h_{k t} f_{j}=0$, which shows that

$$
\begin{equation*}
\beta\left(h_{j i}-\alpha p, p_{i}\right)=0 . \tag{5.33}
\end{equation*}
$$

Thus (5.31) reduces to

$$
\begin{equation*}
k_{J}^{t}\left(\nabla_{k} k_{i t}-n_{k} l_{i t}\right)=0 \tag{5.34}
\end{equation*}
$$

Transvecting (5.34) with $k_{h}{ }^{j}$ and using (5.23), we find

$$
\beta\left(\partial_{h}^{t}-p_{n} p^{t}\right)\left(\nabla_{k} k_{i t}-n_{k} l_{i t}\right)=0,
$$

$$
\text { ( } f, g, u, v, w, \lambda, \mu, \nu \text { )-STRUCTURES }
$$

from which, using (5.32), (5.33) and the fact that $l_{i t} p^{t}=0$,

$$
\begin{equation*}
\beta\left(\nabla_{k} k_{j i}-n_{k} l_{j i}\right)=0 . \tag{5.35}
\end{equation*}
$$

From (4.35) with $l_{j}=m_{j}=0$ and (5.23), we have

$$
\begin{equation*}
l_{j t} l_{\imath}{ }^{t}=\beta\left(g_{j i}-p_{j} p_{\imath}\right), \tag{5.36}
\end{equation*}
$$

from which

$$
\begin{equation*}
l_{j i} i^{j i}=2 n \beta \tag{5.37}
\end{equation*}
$$

Using the same method as that used to derive (5.35) from (5.23), we can derive from (5.36) the following :

$$
\begin{equation*}
\beta\left(\nabla_{k} l_{j i}+n_{k} k_{j i}\right)=0 . \tag{5.38}
\end{equation*}
$$

If $\beta$ is not zero, then (5.33), (5.35) and (5.38) reduce respectively to

$$
\begin{equation*}
h_{j i}=\alpha p, p_{i}, \tag{5.39}
\end{equation*}
$$

and

$$
\begin{equation*}
\nabla_{k} l_{j i}=-n_{k} k_{j i} . \tag{5.41}
\end{equation*}
$$

Differentiating (5.40) covariantly and substituting (5.41), we find

$$
\nabla_{h} \nabla_{k} k_{j i}=\left(\nabla_{h} n_{k}\right) l_{j i}-n_{k} n_{h} k_{j i},
$$

from which, using the Ricci identity and taking account of (5.21),

$$
K_{h k,}{ }^{t} k_{t i}+K_{h k_{2}}{ }^{t} k_{j t}=-2 \beta f_{h k} l_{j i},
$$

or, using (5.1) and (5.39),

$$
\begin{gathered}
\left(k_{h}{ }^{t} k_{k j}-k_{k}{ }^{t} k_{h j}+l_{h}{ }^{t} l_{k j}-l_{k}{ }^{t} l_{h j}\right) k_{t \imath} \\
+\left(k_{h}{ }^{t} k_{k i}-k_{k}{ }^{t} k_{h i}+l_{h}{ }^{t} l_{k i}-l_{k}^{t} l_{h 2}\right) k_{j t}=-2 \beta f_{n k} l_{j i} .
\end{gathered}
$$

Transvecting this with $f^{n k}$ and using (4.26) with $m_{j}=0$ and (4.27) with $l_{j}=0$, we obtain

$$
4\left(k_{s}{ }^{t} l_{j}^{s} k_{t i}+k_{s}{ }^{t} l_{\imath}{ }^{s} k_{j t}\right)=-4 n \beta l_{j i},
$$

from which, using (5.23) and the fact that $l_{j t} p^{t}=0$,

$$
(n+2) l_{j i}=0
$$

since $\beta$ is assumed to be non-zero. This contradicts (5.37). Thus $\beta$ must be zero and this completes the proof of the lemma.

Under the same assumptions as those stated in Lemma 5.4, we have, from (5.24) and (5.37),

$$
\begin{equation*}
k_{j i}=l_{j i}=0, \tag{5.42}
\end{equation*}
$$

and (5.21) reduces to

$$
\begin{equation*}
\nabla_{\jmath} n_{i}-\nabla_{\imath} n_{j}=0 \tag{5.43}
\end{equation*}
$$

Thus we have
Theorem 5.5. Let $M^{2 n+1}$ be a submanifold of codimension 3 of a Euclidean space $E^{2 n+4}$ with ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure satisfying $\lambda^{2}+\mu^{2}+\nu^{2}=1$. If the distinguished normal $C^{A}$ is parallel in the normal bundle and the third fundamental tensor $n_{,}$satisfies $\nabla_{,} n_{2}-\nabla_{2} n_{j}=2 \beta f_{j i}$ for a certain function $\beta$, then $M^{2 n+1}$ is a hypersurface of $E^{2 n+2}$.

From (4.34), (4.35), (5.7) and Theorem 5.5 we have immediately
Corollary 5.5. Let $M^{2 n+1}$ be a submanifold of codimension 3 of a Euclidean space $E^{2 n+4}$ with ( $f, g, u, v, w, \lambda, \mu, \nu$ )-structure satısfying $\lambda^{2}+\mu^{2}+\nu^{2}=1$. If the distinguished normal $C^{A}$ is parallel in the normal bundle and the connection induced in the normal bundle of $M^{2 n+1}$ in $E^{2 n+4}$ is trivial, then $M^{2 n+1}$ is a hypersurface of $E^{2 n+2}$.
