# LOCAL LIMIT THEOREM FOR RANDOM WALK IN PERIODIC ENVIRONMENT 

Toshiyuki TAKENAMI

(Received December 14, 2000)

## 1. Preliminaries and Results

Let $(\Omega, \mathcal{F}, \boldsymbol{P})$ be a probability space on which all our random quantities will be defined. Let $\boldsymbol{Z}^{d}$ be the set of $d$-dimensional integer lattice. We consider Markov chain on $\boldsymbol{Z}^{d}$ with a transition function $P(x, y)$. We denote by $P_{n}(x, y)$ the $n$-th transition function of the Markov chain. We are interested in an asymptotic behaviour of $P_{n}(x, y)$ as $n \rightarrow \infty$, that is, a local limit theorem for the Markov chain. Spitzer showed a uniform estimate of a local limit theorem for random walk in $\boldsymbol{Z}^{d}$ (see, [10, Remark to P7.9 and P7.10]). The purpose of this paper is to extend his result to the Markov chain with the following assumptions.

Assumption 1.1. There exists $s=\left(s_{1}, s_{2}, \ldots, s_{d}\right) \in \boldsymbol{Z}^{d}$ with $s_{l}>0,1 \leq l \leq d$, such that

$$
P\left(x+s_{l} \boldsymbol{e}_{l}, y+s_{l} \boldsymbol{e}_{l}\right)=P(x, y)
$$

for every $x, y \in Z^{d}$ and $l, 1 \leq l \leq d$. Here $\boldsymbol{e}_{l}, 1 \leq l \leq d$, denotes the basis vector $(\underbrace{0, \ldots, 0,1}_{l}, 0, \ldots, 0)$ in $\boldsymbol{Z}^{d}$.

We call a Markov chain with this assumption a random walk in periodic environment (RWPE for abbreviation), and the vector $s$ period of RWPE.

Assumption 1.2. The Markov chain is irreducible and aperiodic, that is, for every $x, y \in Z^{d}$, there exists a positive integer $n_{0}(x, y)$ such that $P_{n}(x, y)>0$ for all $n \geq$ $n_{0}(x, y)$.

We set

$$
\boldsymbol{\Xi}=\left\{\left(j_{1}, j_{2}, \ldots, j_{d}\right) \in \boldsymbol{Z}^{d} \mid 0 \leq j_{1} \leq s_{1}-1, \ldots, 0 \leq j_{d} \leq s_{d}-1\right\}
$$

For $x \in \boldsymbol{Z}$ and $l, 1 \leq l \leq d$, we denote by $T_{l}(x)$ the remainder obtained when $x$ is divided by $s_{l}$, and put $T(x)=\left(T_{1}\left(x_{1}\right), T_{2}\left(x_{2}\right), \ldots, T_{d}\left(x_{d}\right)\right)$ for $x=\left(x_{1}, x_{2}, \ldots, x_{d}\right) \in \boldsymbol{Z}^{d}$.

Let $k$ be a point in $\boldsymbol{\Xi}$, then we say $x$ in $Z^{d}$ a point of type $k$ if $T(x)=k$. Let $Q=$ $\left(q_{j k}\right)_{j, k \in \boldsymbol{\Xi}}$ be a transition matrix, of which each component is given by

$$
q_{j k}=\sum_{T(x)=k} P(j, x) \quad \text { for } j, \quad k \in \boldsymbol{\Xi}
$$

By Assumption 1.2, we see that the matrix $Q$ is ergodic. Then $Q$ has a stationary distribution $\boldsymbol{\pi}=\left(\pi_{j}\right)_{j \in \boldsymbol{\Xi}}$, that is,

$$
\begin{equation*}
\lim _{n \rightarrow \infty} q_{j k}^{(n)}=\pi_{k} \tag{1.1}
\end{equation*}
$$

Assumption 1.3. For each $j \in \boldsymbol{\Xi}$,

$$
\sum_{x \in \mathbf{Z}^{d}}|x| P(j, j+x)<\infty \quad \text { and } \quad \sum_{j \in \boldsymbol{\Xi}} \pi_{j} \sum_{x \in Z^{d}} x P(j, j+x)=\mathbf{0}
$$

Assumption 1.4. The Markov chain has finite second moment, that is,

$$
\sum_{x \in \boldsymbol{Z}^{d}}|x|^{2} P(j, j+x)<\infty \quad \text { for each } j \in \boldsymbol{\Xi}
$$

Let $j, k \in \boldsymbol{\Xi}$ and $x \in \boldsymbol{Z}^{d}$. For $q_{j k}>0$ we define

$$
F_{j k}(x)= \begin{cases}\frac{1}{q_{j k}} P(j, j+x) & \text { if } T(j+x)=k \\ 0 & \text { otherwise }\end{cases}
$$

and for $q_{j k}=0, F_{j k}(x)=1$ if $x=k-j$ and 0 otherwise. Note that $F_{j k}(\cdot)$ is the jump size distribution of the $R W P E$ under the condition that the transition from a point of type $j$ to a point of type $k$ occurs. Define the mean vectors $\mu_{j k}=\left(\mu_{j k ; 1}, \ldots, \mu_{j k ; d}\right)$ and the covariance matrices $C_{j k}=\left(c_{j k ; l m}\right)_{1 \leq l, m \leq d}$ of $F_{j k}(\cdot), j, k \in \boldsymbol{\Xi}$, that is,

$$
\mu_{j k ; l}=\sum_{x \in Z^{d}} x_{l} F_{j k}(x) \quad \text { and } \quad c_{j k ; l m}=\sum_{x \in \boldsymbol{Z}^{d}}\left(x_{l}-\mu_{j k ; l}\right)\left(x_{m}-\mu_{j k ; m}\right) F_{j k}(x)
$$

for $1 \leq l, m \leq d$. Note that by Assumption 1.3

$$
\begin{equation*}
\sum_{j, k \in \boldsymbol{\Xi}} \pi_{j} q_{j k} \mu_{j k}=\mathbf{0} \tag{1.2}
\end{equation*}
$$

Put

$$
\begin{equation*}
Q(\theta)=\left(q_{j k} e^{i\left(\mu_{j k}, \theta\right)}\right)_{j, k \in \Xi} \quad \text { and } \quad f(\theta, z)=|z I-Q(\theta)| \tag{1.3}
\end{equation*}
$$

for $\theta \in \boldsymbol{R}^{d}$ and $z \in \boldsymbol{C}$. Note that $Q=Q(\mathbf{0})$. Since the matrix $Q$ is ergodic, by PerronFrobenius theorem, 1 is a simple root of the characteristic equation $f(\mathbf{0}, z)=0$. See, e.g., Karlin [4]. Thus we see that

$$
\begin{equation*}
\frac{\partial f}{\partial z}(\mathbf{0}, 1) \neq 0 \tag{1.4}
\end{equation*}
$$

Set

$$
\begin{align*}
b_{l m} & =\frac{\partial^{2} f}{\partial \theta_{l} \partial \theta_{m}}(\mathbf{0}, 1) / \frac{\partial f}{\partial z}(\mathbf{0}, 1) \quad \text { for } 1 \leq l, m \leq d  \tag{1.5}\\
B & =\left(b_{l m}\right)_{1 \leq l, m \leq d} \quad \text { and } \quad D=\sum_{j, k \in \Xi} \pi_{j} q_{j k} C_{j k}+B
\end{align*}
$$

In Lemma 6.9, we will show that the matrix $D$ is positive definite if the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4. Let \# $\boldsymbol{\Xi}$ denote the cardinarity of the set $\boldsymbol{\Xi}$. Now let us state our result.

Theorem 1.1. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4. Then

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left((2 \pi n)^{d / 2} P_{n}(x, y)-(\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}\right)=0 \tag{1.6}
\end{equation*}
$$

uniformly for all $x, y \in \boldsymbol{Z}^{d}$.
Theorem 1.2. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4. Then

$$
\begin{align*}
& \lim _{n \rightarrow \infty} \frac{|y-x|^{2}}{n}  \tag{1.7}\\
& \quad \times\left((2 \pi n)^{d / 2} P_{n}(x, y)-(\# \Xi)|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}\right)=0
\end{align*}
$$

uniformly for all $x, y \in \boldsymbol{Z}^{d}$.
First we shall prove the relations (1.6) and (1.7) under additional assumptions given below and thereafter remove them.

Assumption 1.5. For some $j, k \in \boldsymbol{\Xi}$ for which $q_{j k}>0, C_{j k}$ is positive definite.

Let $\phi_{j k}(\cdot), j, k \in \boldsymbol{\Xi}$, denote the characteristic function of $F_{j k}(\cdot)$, that is,

$$
\phi_{j k}(\theta)=\sum_{x \in \mathbf{Z}^{d}} e^{i(\theta, x)} F_{j k}(x) \quad \text { for } j, k \in \boldsymbol{\Xi}, \theta \in \boldsymbol{R}^{d} .
$$

ASSUMPTION 1.6. On $\left[-\pi / s_{1}, \pi / s_{1}\right] \times \cdots \times\left[-\pi / s_{d}, \pi / s_{d}\right], \prod_{j, k \in \Xi}\left|\phi_{j k}(\theta)\right|$ equals 1 if and only if $\theta=\mathbf{0}$.

Lemma 1.1. Under Assumptions 1.1 through 1.6, the formula (1.6) holds.
Lemma 1.2. Under Assumptions 1.1 through 1.6, the formula (1.7) holds.
For each $j, k \in \boldsymbol{\Xi}$, let $\left\{Y_{n}^{j k}\right\}_{n \geq 1}$ be a family of independent identically distributed random vectors, and $\left\{\chi_{n}\right\}_{n \geq 0}$ be an ergodic Markov chain with a finite state space $\boldsymbol{\Xi}$. Assume that $\left\{Y_{n}^{j k}\right\}_{n \geq 1}^{j, k \in \Xi}$ and $\left\{\chi_{n}\right\}_{n \geq 1}$ are mutually independent. Set $X_{n}=$ $Y_{1}^{\chi_{0} \chi_{1}}+\cdots+Y_{n}^{\chi_{n-1} \chi_{n}}$. Then such a process may be called a random walk defined on a finite Markov chain. By Lemma 2.1 in Section 2, we will show that RWPE may be realized as such a process. In 1-dimensional case, Miller [8] studied an asymptotic behaviour of $\mathbf{P}\left\{X_{n}=x \mid \chi_{n}=j, \chi_{0}=k\right\}$, and Keilson and Wishart [5] proved the central limit theorem of the process.

In [7] Kotani gave a Martingale approach to the central limit theorem and related problem for a class of periodic Markov chains. Kotani, Shirai and Sunada [6] considered local limit theorem for a class of Markov chains on an infinite graph satisfying a certain periodic condition. They treated the reversible Markov chain with the property that a particle at a given site can move to only finitely many sites in one unit of time.

In Section 2, in order to prove Lemma 1.1, we introduce the sequence of lemmas. In Section 3, we prove Lemma 1.1. In Section 4, we give some lemmas on which our proof of Lemma 1.2 is based. In Section 5, we prove Lemma 1.2. In Section 6, we give some lemmas for Theorems 1.1 and 1.2. In Section 7, we prove these theorems, extending Lemmas 1.1 and 1.2.

## 2. $\quad$ Some Lemmas for Lemma 1.1

In this section, we introduce some lemmas on which our proofs of Lemmas 1.1 and 1.2 are based.

Lemma 2.1. Suppose that the transition function $P(x, y)$ satisfies Assumption 1.1. Then for all $n, n \geq 1$, and $x, y \in \boldsymbol{Z}^{d}$, we have

$$
\begin{equation*}
P_{n}(x, y)=\sum_{j_{1}, \ldots, j_{n-1} \in \Xi} q_{T(x) j_{1}} q_{j_{1} j_{2}} \cdots q_{j_{n-1} T(y)} F_{T(x) j_{1}} * F_{j_{1} j_{2}} * \cdots * F_{j_{n-1} T(y)}(y-x), \tag{2.1}
\end{equation*}
$$

where $F * G$ is the convolution of $F$ and $G$.

Lemma 2.1 is suggested by Shiga. See Chapter 7 of his book [9].
By Lemma 2.1 and the inversion formula for Fourier transform, $P_{n}(x, y)$ equals

$$
\begin{equation*}
\sum_{j_{1}, \ldots, j_{n-1} \in \Xi} q_{T(x) j_{1}} \cdots q_{j_{n-1} T(y)} \frac{1}{(2 \pi)^{d}} \int_{[-\pi, \pi]^{d}} e^{-i(\theta, y-x)} \phi_{T(x) j_{1}}(\theta) \cdots \phi_{j_{n-1} T(y)}(\theta) d \theta \tag{2.2}
\end{equation*}
$$

Then by Assumption 1.1, we have the following lemma.

Lemma 2.2. Suppose that the transition function $P(x, y)$ satisfies Assumption 1.1. Then for all $n \geq 1$ and $x, y \in Z^{d}$ we have

$$
\begin{align*}
P_{n}(x, y)= & \sum_{j_{1}, \ldots, j_{n-1} \in \boldsymbol{\Xi}} q_{T(x) j_{1}} \cdots q_{j_{n-1} T(y)}  \tag{2.3}\\
& \times \frac{(\# \Xi)}{(2 \pi)^{d}} \int_{\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{s_{d}}, \frac{\pi}{s_{d}}\right]} e^{-i(\theta, y-x)} \phi_{T(x) j_{1}}(\theta) \cdots \phi_{j_{n-1} T(y)}(\theta) d \theta
\end{align*}
$$

Proof. By Assumption 1.1, we have $\phi_{j k}\left(\theta+\left(2 \pi / s_{l}\right) \boldsymbol{e}_{l}\right)=\exp \left\{i\left(2 \pi / s_{l}\right)\left(k_{l}-\boldsymbol{j}_{l}\right)\right\} \times$ $\phi_{j k}(\theta)$. By applying this formula to (2.2), we obtain (2.3).

Denote by $\left\{\xi_{n}\right\}_{n \geq 0}$ the Markov chain on $\boldsymbol{\Xi}$ with the transition matrix $Q$. Set

$$
\begin{gathered}
N_{n}^{j k}=\#\left\{1 \leq m \leq n \mid \xi_{m-1}=j, \xi_{m}=k\right\} \\
M_{n ; l}=\sum_{j, k \in \Xi} \mu_{j k ; l} N_{n}^{j k} \text { and } M_{n}=\left(M_{n ; 1}, M_{n ; 2}, \ldots, M_{n ; d}\right)
\end{gathered}
$$

Put $\psi_{j k}(\theta)=\phi_{j k}(\theta) e^{-i\left(\theta, \mu_{j k}\right)}$ for $j, k \in \boldsymbol{\Xi}$. Then we have

$$
\begin{align*}
& P_{n}(x, y)=\frac{(\# \boldsymbol{\Xi})}{(2 \pi)^{d}} \int_{\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{s_{d}}, \frac{\pi}{s_{d}}\right]} \exp \{-i(\theta, y-x)\}  \tag{2.4}\\
& \times \boldsymbol{E}\left[\prod_{j, k \in \Xi} \psi_{j k}(\theta)^{N_{n}^{j k}} \exp \left\{i\left(\theta, M_{n}\right)\right\} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right] d \theta
\end{align*}
$$

It follows from the weak law of large numbers for ergodic Markov chains that, for $j$, $k \in \boldsymbol{\Xi}$,

$$
\begin{equation*}
\frac{N_{n}^{j k}}{n} \rightarrow \pi_{j} q_{j k} \tag{2.5}
\end{equation*}
$$

in probability as $n \rightarrow \infty$. Moreover we have the following large deviation type esti-
mate. Set

$$
\begin{equation*}
\boldsymbol{A}_{n \zeta}=\bigcap_{j, k \in \Xi}\left\{\left|\frac{N_{n}^{j k}}{n}-\pi_{j} q_{j k}\right|<\zeta\right\} . \tag{2.6}
\end{equation*}
$$

Lemma 2.3. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 and 1.2. Then for all $\zeta>0$, we have

$$
\begin{equation*}
\boldsymbol{P}\left\{\boldsymbol{A}_{n \zeta}^{c}\right\} \leq K e^{-L n} \quad \text { for } j, k \in \boldsymbol{\Xi}, \tag{2.7}
\end{equation*}
$$

where $K$ and $L$ are positive constants depending on $\zeta$ but not on $n$.
See, e.g., Dembo and Zeitouni [2, p. 64].
Recall Assumption 1.3 and (2.5). We have the following central limit theorem for $M_{n}$.

Lemma 2.4. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.3. Then

$$
\begin{gather*}
\lim _{n \rightarrow \infty} \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=k \mid \xi_{0}=j\right]  \tag{2.8}\\
=\exp \left\{-\frac{1}{2}(w, B w)\right\} \pi_{k} \quad \text { for } j, k \in \boldsymbol{\Xi},
\end{gather*}
$$

where the matrix $B$ is non-negative definite.
Proof. For a proof in the 1-dimensional case, see Hatori and Mori [3, p. 124]. We will show (2.8) in the multi-dimensional case.

We denote by $q_{j k}^{(n)}(\theta), \theta \in \boldsymbol{R}^{d}$, the component of the matrix $Q(\theta)^{n}$. Note that we have

$$
\begin{equation*}
q_{j k}^{(n)}(\theta)=\boldsymbol{E}\left[\exp \left\{i\left(\theta, M_{n}\right)\right\} ; \xi_{n}=k \mid \xi_{0}=j\right] . \tag{2.9}
\end{equation*}
$$

We will show $\lim _{n \rightarrow \infty} q_{j k}^{(n)}(w / \sqrt{n})=\exp \{(-1 / 2)(w, B w)\} \pi_{k}$. For every $z$ with $|z|<$ $1, z \in \boldsymbol{C}$, we have $\sum_{n=0}^{\infty} Q(\theta)^{n} z^{n}=(I-z Q(\theta))^{-1}$. We denote by $R(\theta, z)=$ $\left(r_{j k}(\theta, z)\right)_{j, k \in \Xi}$ the co-factor matrix of $I-z Q(\theta)$, so that

$$
\begin{equation*}
\sum_{n=0}^{\infty} q_{j k}^{(n)}(\theta) z^{n}=\frac{r_{j k}(\theta, z)}{|I-z Q(\theta)|} \tag{2.10}
\end{equation*}
$$

Let $\kappa_{\nu}(\theta), \nu=1,2, \ldots, \# \boldsymbol{\Xi}$, denote the eigenvalues of $Q(\theta)$. Since $Q(\mathbf{0})=Q$, we may take $\kappa_{1}(\mathbf{0})=1$ and $\max _{2 \leq \nu \leq \boldsymbol{\Xi}}\left|\kappa_{\nu}(\mathbf{0})\right|<1$. Moreover there exist a neibourhood $\boldsymbol{U}$
of $\theta=\mathbf{0}$ and constant $\rho, 0<\rho<1$, such that $\kappa_{1}(\theta)$ is analytic in $\boldsymbol{U}$ (see, Bochner and Martin [1, p. 39]) and $\kappa_{\nu}(\theta), 1 \leq \nu \leq \# \boldsymbol{\Xi}$, are continuous in $\boldsymbol{R}^{d}$ (see, Takagi [11, p. 56]) and

$$
\begin{equation*}
\inf _{\theta \in U}\left|\kappa_{1}(\theta)\right|>\rho \quad \text { and } \quad \sup _{\theta \in U}\left|\kappa_{\nu}(\theta)\right|<\rho \text { for } \nu=2, \ldots, \# \Xi . \tag{2.11}
\end{equation*}
$$

Since $f\left(\theta, \kappa_{\nu}(\theta)\right)=0, \nu=1,2, \ldots, \# \boldsymbol{\Xi}$, we may write

$$
|I-z Q(\theta)|=z^{(\# \Xi)} f\left(\theta, \frac{1}{z}\right)=\left(1-\kappa_{1}(\theta) z\right) g(\theta, z)
$$

where $g(\theta, z)$ is a polynomial of degree $\# \boldsymbol{\Xi}-1$ in $z$, and $g\left(\theta, 1 / \kappa_{\nu}(\theta)\right)=0$ if $\kappa_{\nu}(\theta) \neq$ $0, \nu=2, \ldots, \# \boldsymbol{\Xi}$. Thus we have

$$
\begin{equation*}
\frac{r_{j k}(\theta, z)}{|I-z Q(\theta)|}=\frac{r_{j k}(\theta, z)}{\left(1-\kappa_{1}(\theta) z\right) g(\theta, z)}=\frac{\sigma_{j k}(\theta)}{1-\kappa_{1}(\theta) z}+\frac{\tau_{j k}(\theta, z)}{g(\theta, z)}, \tag{2.12}
\end{equation*}
$$

where $\sigma_{j k}(\theta)=r_{j k}\left(\theta, 1 / \kappa_{1}(\theta)\right) / g\left(\theta, 1 / \kappa_{1}(\theta)\right)$ and $\tau_{j k}(\theta, z)$ is a polynomial of degree \# $\boldsymbol{\Xi}$ - 2 in $z$. Put

$$
\begin{equation*}
u(\theta)=\max _{2 \leq \nu \leq \# \Xi}\left|\kappa_{\nu}(\theta)\right| . \tag{2.13}
\end{equation*}
$$

Then $\tau_{j k}(\theta, z) / g(\theta, z)$ is analytic in $z$ for $|z|<1 / u(\theta)$. Thus we may write

$$
\frac{\tau_{j k}(\theta, z)}{g(\theta, z)}=\sum_{m=0}^{\infty} c_{m}^{j k}(\theta) z^{m}, \quad \text { where } \quad c_{m}^{j k}(\theta)=\frac{1}{m!} \frac{\partial^{m}}{\partial z^{m}}\left\{\frac{\tau_{j k}(\theta, z)}{g(\theta, z)}\right\}_{z=0}
$$

Since this series has the radius $1 / u(\theta)$ of convergence, we have

$$
u(\theta)=\lim \sup _{m \rightarrow \infty}\left|c_{m}^{j k}(\theta)\right|^{1 / m}
$$

Therefore by (2.10), (2.11), (2.12) and (2.13), we have

$$
\begin{equation*}
q_{j k}^{(n)}(\theta)=\sigma_{j k}(\theta) \kappa_{1}(\theta)^{n}+c_{n}^{j k}(\theta) \quad \text { and } \quad c_{n}^{j k}(\theta)=o\left(\kappa_{1}(\theta)^{n}\right) \tag{2.14}
\end{equation*}
$$

Since $(\partial f / \partial z)(\mathbf{0}, 1) \neq 0$ by (1.4), we may use the implicit function theorem for $\kappa_{1}(\theta)$ to have

$$
\begin{equation*}
\kappa_{1}(\theta)=1+\sum_{l=1}^{d} \frac{\partial \kappa_{1}}{\partial \theta_{l}}(\mathbf{0}) \theta_{l}+\frac{1}{2} \sum_{l, m=1}^{d} \frac{\partial^{2} \kappa_{1}}{\partial \theta_{l} \partial \theta_{m}}(\mathbf{0}) \theta_{l} \theta_{m}+o\left(|\theta|^{2}\right), \tag{2.15}
\end{equation*}
$$

where

$$
\begin{equation*}
\frac{\partial \kappa_{1}}{\partial \theta_{l}}(\mathbf{0})=-\frac{\partial f}{\partial \theta_{l}}(\mathbf{0}, 1) / \frac{\partial f}{\partial z}(\mathbf{0}, 1) \tag{2.16}
\end{equation*}
$$

and

$$
\begin{align*}
\frac{\partial^{2} \kappa_{1}}{\partial \theta_{l} \partial \theta_{m}}(\mathbf{0})=-\frac{\frac{\partial^{2} f}{\partial \theta_{l} \partial \theta_{m}}(\mathbf{0}, 1)}{\frac{\partial f}{\partial z}(\mathbf{0}, 1)}+\frac{\frac{\partial f}{\partial \theta_{l}}(\mathbf{0}, 1) \frac{\partial^{2} f}{\partial \theta_{m} \partial z}(\mathbf{0}, 1)}{\left(\frac{\partial f}{\partial z}(\mathbf{0}, 1)\right)^{2}}  \tag{2.17}\\
+\frac{\frac{\partial^{2} f}{\partial \theta_{l} \partial z}(\mathbf{0}, 1) \frac{\partial f}{\partial \theta_{m}}(\mathbf{0}, 1)}{\left(\frac{\partial f}{\partial z}(\mathbf{0}, 1)\right)^{2}}-\frac{\frac{\partial f}{\partial \theta_{l}}(\mathbf{0}, 1) \frac{\partial f}{\partial \theta_{l}}(\mathbf{0}, 1) \frac{\partial^{2} f}{\partial z^{2}}(\mathbf{0}, 1)}{\left(\frac{\partial f}{\partial z}(\mathbf{0}, 1)\right)^{3}}
\end{align*}
$$

By (2.14), (2.15) and (2.16),

$$
\begin{equation*}
\lim _{n \rightarrow \infty} q_{j k}^{(n)}\left(\frac{w}{n}\right)=\sigma_{j k}(\mathbf{0}) \exp \left\{-\sum_{l=1}\left(\frac{\partial f}{\partial \theta_{l}}(\mathbf{0}, 1) / \frac{\partial f}{\partial z}(\mathbf{0}, 1)\right) w_{l}\right\} \tag{2.18}
\end{equation*}
$$

for every $w \in \boldsymbol{R}^{d}$. Set $w=\mathbf{0}$ in (2.18), then by (1.1) we obtain

$$
\begin{equation*}
\sigma_{j k}(\mathbf{0})=\pi_{k} \tag{2.19}
\end{equation*}
$$

We show $\left(\partial f / \partial \theta_{l}\right)(\mathbf{0}, 1)=0$ for all $l, 1 \leq l \leq d$. Note that
(2.20) $\quad \lim _{n \rightarrow \infty} \frac{M_{n ; l}}{n}=\sum_{j, k \in \Xi} \mu_{j k ; l} \pi_{j} q_{j k} \quad$ in probability, $\quad 1 \leq l \leq d$.

By (1.2), the right hand side of (2.20) equals 0 . Therefore

$$
\lim _{n \rightarrow \infty} \boldsymbol{E}\left[\exp \left\{i\left(w, \frac{\boldsymbol{M}_{n}}{n}\right)\right\} ; \xi_{n}=k \mid \xi_{0}=j\right]=\pi_{k} \quad \text { for all } w \in \boldsymbol{R}^{d}
$$

By (2.18) and (2.19),

$$
\exp \left\{-\sum_{l=1}^{d}\left(\frac{\partial f}{\partial \theta_{l}}(\mathbf{0}, 1) / \frac{\partial f}{\partial z}(\mathbf{0}, 1)\right) w_{l}\right\}=1 \quad \text { for all } w \in \boldsymbol{R}^{d}
$$

so that $\left(\partial f / \partial \theta_{l}\right)(\mathbf{0}, 1)=0$ for all $l, 1 \leq l \leq d$. Thus we have from (2.15), (2.16) and (2.17)

$$
\begin{equation*}
\kappa_{1}(\theta)=1-\frac{1}{2}(\theta, B \theta)+o\left(|\theta|^{2}\right) \tag{2.21}
\end{equation*}
$$

Substitute (2.21) to (2.14) and set $\theta=w / \sqrt{n}$, then we obtain (2.8).

It follows from the central limit theorem for sums of i.i.d. random variables that

$$
\begin{equation*}
\psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}} \rightarrow \exp \left\{-\frac{1}{2}\left(w, \pi_{j} q_{j k} C_{j k} w\right)\right\} \tag{2.22}
\end{equation*}
$$

By (2.8) and (2.22), we have the following lemma.
Lemma 2.5. If the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4 , then

$$
\begin{aligned}
& \lim _{n \rightarrow \infty} \prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}} \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=k^{\prime} \mid \xi_{0}=j^{\prime}\right] \\
& \quad=\exp \left\{-\frac{1}{2}(w, D w)\right\} \pi_{k^{\prime}}
\end{aligned}
$$

for $w \in \boldsymbol{R}^{d}, j^{\prime}, k^{\prime} \in \boldsymbol{\Xi}$.
Using P 7.4 and P 7.7 of Spitzer [10], we have the following lemma.
Lemma 2.6. If the transition function $P(x, y)$ satisfies Assumptions 1.1, 1.4 and 1.5 , then there exist $j, k \in \Xi$ and positive constants $\delta$ and $\lambda$ such that $\left|\psi_{j k}(\theta)\right| \leq$ $e^{-\lambda|\theta|^{2}}$ when $|\theta|<\delta$.

By Assumption 1.4 and Maclaurin expansion for $\psi_{j k}(\theta)$, we have the following lemma.

Lemma 2.7. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1, 1.2 and 1.4. There exist positive constants $\delta$ and a such that for every $\zeta$, $0<\zeta<1$,

$$
\begin{equation*}
\left|1-\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}(\omega)-n \pi_{j} q_{j k}}\right| \leq a \zeta|w|^{2} \exp \left\{a \zeta|w|^{2}\right\} \tag{2.23}
\end{equation*}
$$

when $|w / \sqrt{n}|<\delta$ and $\omega \in \boldsymbol{A}_{n \zeta}$.

## 3. Proof of Lemma 1.1

We will prove Lemma 1.1. Suppose that $P(x, y)$ satisfies Assumptions 1.1 through 1.6 in this section. Then by Assumption 1.5 and Lemma $2.4, D$ is positive definite. We will show the formula (1.6). Take $0<\alpha, \zeta<\infty$. Let $\delta$ be positive constant satisfying Lemmas 2.6 and 2.7. Set $w=\sqrt{n} \theta$. We may write

$$
\begin{aligned}
& \frac{(2 \pi n)^{d / 2}}{(\# \boldsymbol{\Xi})} P_{n}(x, y) \\
& \quad=\frac{1}{(2 \pi)^{d / 2}} \int_{\sqrt{n}\left(\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{s_{d}}, \frac{\pi}{s_{d}}\right]\right)} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\}
\end{aligned}
$$

$$
\begin{aligned}
& \times \boldsymbol{E}\left[\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}}\right) \exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right] d w \\
= & I_{0}(n)+I_{1}(n, \alpha)+I_{2}(n, \alpha)+I_{3}(n, \alpha, \delta)+I_{4}(n, \delta, \zeta) \\
& +I_{5}(n, \delta, \zeta)+I_{6}(n, \delta, \zeta)+I_{7}(n, \delta, \zeta)
\end{aligned}
$$

where

$$
\begin{aligned}
& I_{0}(n)=\frac{1}{(2 \pi)^{d / 2}} \int_{\mathbf{R}^{d}} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \exp \left\{-\frac{1}{2}(w, D w)\right\} \pi_{T(y)} d w, \\
& I_{1}(n, \alpha)=-\frac{1}{(2 \pi)^{d / 2}} \int_{|w|>\alpha} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \exp \left\{-\frac{1}{2}(w, D w)\right\} \pi_{T(y)} d w, \\
& I_{2}(n, \alpha)=\frac{1}{(2 \pi)^{d / 2}} \int_{|w| \leq \alpha} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\}\left(\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right)\right. \\
& \times \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right] \\
& \left.-\exp \left\{-\frac{1}{2}(w, D w)\right\} \pi_{T(y)}\right) d w, \\
& I_{3}(n, \alpha, \delta)=\frac{1}{(2 \pi)^{d / 2}} \int_{\alpha<|w| \leq \sqrt{n} \delta} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\}\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right) \\
& \times \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right] d w, \\
& I_{4}(n, \delta, \zeta)=-\frac{1}{(2 \pi)^{d / 2}} \int_{|w| \leq \sqrt{n} \delta} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\}\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right) \\
& \times \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y), \boldsymbol{A}_{n \zeta}^{c} \mid \xi_{0}=T(x)\right] d w, \\
& I_{5}(n, \delta, \zeta)=-\frac{1}{(2 \pi)^{d / 2}} \int_{|w| \leq \sqrt{n} \delta} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\}\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right) \\
& \times \boldsymbol{E}\left[\left(1-\left(\prod_{j, k \in \boldsymbol{\Xi}} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}-n \pi_{j} q_{j k}}\right)\right)\right. \\
& \left.\times \exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y), A_{n \zeta} \mid \xi_{0}=T(x)\right] d w, \\
& I_{6}(n, \delta, \zeta)=\frac{1}{(2 \pi)^{d / 2}} \int_{|w|>\sqrt{n} \delta ; \sqrt{n}\left(\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{s_{d}}, \frac{\pi}{s_{d}}\right]\right)} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \\
& \times \boldsymbol{E}\left[\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}}\right)\right.
\end{aligned}
$$

$$
\left.\times \exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y), \boldsymbol{A}_{n \zeta} \mid \xi_{0}=T(x)\right] d w
$$

and

$$
\begin{aligned}
& I_{7}(n, \delta, \zeta)=\frac{1}{(2 \pi)^{d / 2}} \int_{\sqrt{n}\left(\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{s_{d}}, \frac{\pi}{s_{d}}\right]\right)} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \\
& \times \boldsymbol{E}\left[\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}}\right)\right. \\
&\left.\quad \times \exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y), A_{n \zeta}^{c} \mid \xi_{0}=T(x)\right] d w
\end{aligned}
$$

A direct calculation shows that

$$
I_{0}(n)=|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}
$$

It remains to show that the terms $I_{1}, I_{2}, \ldots, I_{7}$ go to zero uniformly in $x, y$ as $n \rightarrow$ $\infty$. We have

$$
\left|I_{1}(n, \alpha)\right| \leq(2 \pi)^{-d / 2} \int_{|w|>\alpha} \exp \left\{-\frac{1}{2}(w, D w)\right\} \pi_{T(y)} d w
$$

which can be made arbitary small by taking $\alpha$ sufficiently large.
By Lemma 2.5 and Lebesgue's dominated convergence theorem, for every $\alpha$

$$
\begin{aligned}
\left|I_{2}(n, \alpha)\right|=(2 \pi)^{-d / 2} & \int_{|w| \leq \alpha} \left\lvert\,\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right)\right. \\
\times \boldsymbol{E} & {\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right] } \\
& \left.-\exp \left\{-\frac{1}{2}(w, D w)\right\} \pi_{T(y)} \right\rvert\, d w \rightarrow 0 \quad \text { as } n \rightarrow \infty
\end{aligned}
$$

By Lemma 2.6, $\left|I_{3}(n, \alpha, \delta)\right| \leq \int_{\alpha<|w|} e^{-\lambda|w|^{2}} d w$, which can be made arbitary small by taking $\alpha$ sufficientry large. By Lemma 2.3, $\left|I_{4}(n, \delta, \zeta)\right| \leq K(2 \delta \sqrt{n})^{d} e^{-L n}$, where $K$ and $L$ are positive constants in Lemma 2.3. Note Lemmas 2.6 and 2.7. Then we have

$$
\left|I_{5}(n, \delta, \zeta)\right| \leq(2 \pi)^{-d / 2} a \zeta \int_{\boldsymbol{R}^{d}}|w|^{2} e^{-(\lambda-a \zeta)|w|^{2}} d w
$$

which can be made arbitary small by taking $\zeta$ sufficiently small.

Let $\beta=\min \left\{\pi_{j} q_{j k} \mid q_{j k}>0, j, k \in \boldsymbol{\Xi}\right\}$ and choose $\zeta, 0<\zeta<\beta / 2$. Then by Assumption 1.6 there exists a positive constant $\gamma, 0<\gamma<1$, such that

$$
\prod_{j, k \in \Xi}\left|\phi_{j k}\left(\frac{w}{\sqrt{n}}\right)\right|^{N_{n}^{j k}(\omega)}<(1-\gamma)^{n \beta / 2}
$$

when

$$
w \in \sqrt{n}\left(\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{s_{d}}, \frac{\pi}{s_{d}}\right]\right),\left|\frac{w}{\sqrt{n}}\right|>\delta \quad \text { and } \quad \omega \in \boldsymbol{A}_{n \zeta}
$$

Hence $\left|I_{6}(n, \delta, \zeta)\right| \leq(2 \pi n)^{d / 2}(1-\gamma)^{n \beta / 2}$. By analougous way to $I_{4}(n, \delta),\left|I_{7}(n, \delta, \zeta)\right| \leq$ $(2 \pi n)^{d / 2} K e^{-L n}$.

The proof of Lemma 1.1 is complete.

## 4. Some Lemmas for Lemma 1.2

We introduce the $d$-dimensional Laplacian $\Delta_{\theta}=\sum_{l=1}^{d}\left(\partial^{2} / \partial \theta_{l}^{2}\right)$.

Lemma 4.1. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 and 1.4. Then we have

$$
\begin{aligned}
|x-y|^{2} P_{n}(x, y)= & -\frac{(\# \boldsymbol{\Xi})}{(2 \pi)^{d}} \int_{\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{s_{d}}, \frac{\pi}{s_{d}}\right]} e^{-i(\theta, y-x)} \\
& \times \Delta_{\theta}\left\{\boldsymbol{E}\left[\left(\prod_{j, k \in \boldsymbol{\Xi}} \psi_{j k}(\theta)^{N_{n}^{j k}}\right) e^{i\left(\theta, M_{n}\right)} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right]\right\} d \theta
\end{aligned}
$$

for all $n \geq 1$ and $x, y \in Z^{d}$.

Proof. Using the formula for integration by parts and Assumptions 1.1 and 1.4, we have

$$
\begin{aligned}
& \left(y_{l}-x_{l}\right)^{2} \int_{-\pi / s_{l}}^{\pi / s_{l}} e^{-i(\theta, y-x)} \phi_{T(x) j_{1}}(\theta) \phi_{j_{1} j_{2}}(\theta) \cdots \phi_{j_{n-1} T(y)}(\theta) d \theta_{l} \\
& \quad=-\int_{-\pi / s_{l}}^{\pi / s_{l}} e^{-i(\theta, y-x)} \frac{\partial^{2}}{\partial \theta_{l}^{2}}\left\{\phi_{T(x) j_{1}}(\theta) \phi_{j_{1} j_{2}}(\theta) \cdots \phi_{j_{n-1} T(y)}(\theta)\right\} d \theta_{l}
\end{aligned}
$$

for $l, 1 \leq l \leq d$. Thus we obtain the relation of the lemma.

Lemma 4.2. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.3. Then

$$
\begin{align*}
\lim _{n \rightarrow \infty} & \frac{\partial}{\partial w_{l}}\left\{\boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=k \mid \xi_{0}=j\right]\right\}  \tag{4.1}\\
& =\frac{\partial}{\partial w_{l}}\left\{\exp \left\{-\frac{1}{2}(w, B w)\right\} \pi_{k}\right\}
\end{align*}
$$

and

$$
\begin{align*}
\lim _{n \rightarrow \infty} & \frac{\partial^{2}}{\partial w_{m} \partial w_{l}}\left\{\boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=k \mid \xi_{0}=j\right]\right\}  \tag{4.2}\\
& =\frac{\partial^{2}}{\partial w_{m} \partial w_{l}}\left\{\exp \left\{-\frac{1}{2}(w, B w)\right\} \pi_{k}\right\} .
\end{align*}
$$

for $w \in \boldsymbol{R}^{d}, j, k \in \boldsymbol{\Xi}$ and $1 \leq l, m \leq d$.
Proof. Differentiate each side of (2.10). Thus by arguments similar to that made for the proof of Lemma 2.4, we obtain (4.1) and (4.2).

As in Spitzer [10, p. 80], we have

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \frac{\partial}{\partial w_{l}}\left\{\psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right\}=\frac{\partial}{\partial w_{l}}\left\{\exp \left\{-\frac{1}{2}\left(w, \pi_{j} q_{j k} C_{j k} w\right)\right\}\right\} \tag{4.3}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \frac{\partial^{2}}{\partial w_{l}^{2}}\left\{\psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right\}=\frac{\partial^{2}}{\partial w_{l}^{2}}\left\{\exp \left\{-\frac{1}{2}\left(w, \pi_{j} q_{j k} C_{j k} w\right)\right\}\right\}, \tag{4.4}
\end{equation*}
$$

$1 \leq l \leq d$. By Lemma 4.2, (4.3) and (4.4), we have the following lemma.
Lemma 4.3. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4. Then

$$
\begin{aligned}
\lim _{n \rightarrow \infty} & \Delta_{w}\left\{\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j i k}}\right) \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=k^{\prime} \mid \xi_{0}=j^{\prime}\right]\right\} \\
& =\Delta_{w}\left\{\exp \left\{-\frac{1}{2}(w, D w)\right\} \pi_{k^{\prime}}\right\}
\end{aligned}
$$

for $w \in \boldsymbol{R}^{d}, j^{\prime}, k^{\prime} \in \boldsymbol{\Xi}$.

Lemma 4.4. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.5. There exist positive constants $\delta, \lambda$ and $b_{1}$ such that

$$
\begin{equation*}
\left|\frac{\partial}{\partial w_{l}}\left\{\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right\}\right| \leq b_{1}|w| \exp \left\{-\lambda|w|^{2}\right\} \tag{4.5}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|\frac{\partial^{2}}{\partial w_{l}^{2}}\left\{\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi q_{j} q_{j k}}\right\}\right| \leq b_{1}\left(1+|w|^{2}\right) \exp \left\{-\lambda|w|^{2}\right\} \tag{4.6}
\end{equation*}
$$

for all $l, 1 \leq l \leq d$, when $|w / \sqrt{n}|<\delta$.
Proof. See, for a proof, Spitzer [10, p. 81].
As in the proof of Lemma 2.7, we have the following lemma.
Lemma 4.5. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1, 1.2 and 1.4. There exist positive constans $\delta$ and $b_{2}$ such that for every $\zeta$, $0<\zeta<1$, we have

$$
\begin{equation*}
\left|\frac{\partial}{\partial w_{l}}\left\{1-\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}(\omega)-n \pi_{j} q_{j k}}\right\}\right| \leq b_{2} \zeta|w| \exp \left\{b_{2} \zeta|w|^{2}\right\} \tag{4.7}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|\frac{\partial^{2}}{\partial w_{l}^{2}}\left\{1-\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}(\omega)-n \pi_{j} q_{j k}}\right\}\right| \leq b_{2} \zeta\left(1+|w|^{2}\right) \exp \left\{b_{2} \zeta|w|^{2}\right\} \tag{4.8}
\end{equation*}
$$

when $|\omega / \sqrt{n}|<\delta$ and $\omega \in \boldsymbol{A}_{n \zeta}$.
By analogous way to Lemma 4.2, we have the following lemma.
Lemma 4.6. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.3. There exist positive constants $\delta$ and $b_{3}$ such that for $1 \leq l \leq d$, $j, k \in \boldsymbol{\Xi}$,

$$
\begin{equation*}
\left|\frac{\partial}{\partial w_{l}}\left\{\boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=k \mid \xi_{0}=j\right]\right\}\right| \leq b_{3}(|w|+1) \tag{4.9}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|\frac{\partial^{2}}{\partial w_{l}^{2}}\left\{\boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=k \mid \xi_{0}=j\right]\right\}\right| \leq b_{3}\left(|w|^{2}+1\right) \tag{4.10}
\end{equation*}
$$

when $|w / \sqrt{n}|<\delta$.
Lemma 4.7. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 and 1.2. Then there exists positive constant $b_{4}$ such that for every $\zeta>0$
(4.11) $\left|\frac{\partial}{\partial w_{l}}\left\{\boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=k, \boldsymbol{A}_{n \zeta}^{c} \mid \xi_{0}=j\right]\right\}\right| \leq b_{4} K \sqrt{n} \exp \{-L n\}$ and

$$
\begin{equation*}
\left|\frac{\partial^{2}}{\partial w_{l}^{2}}\left\{\boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=k, \boldsymbol{A}_{n \zeta}^{c} \mid \xi_{0}=j\right]\right\}\right| \leq b_{4} K n \exp \{-L n\} \tag{4.12}
\end{equation*}
$$ where $K$ and $L$ are positive constants given in Lemma 2.3.

Proof. Note that $\left|M_{n ; l}\right| \leq$ constant $\times n$ for all $\omega \in \Omega$ and $l, l \leq l \leq d$. Thus by Lemma 2.3, we obtain (4.11) and (4.12).

Lemma 4.8. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1, 1.2, 1.4 and 1.6. Let $\beta=\min \left\{\pi_{j} q_{j k} \mid q_{j k}>0, j, k \in \boldsymbol{\Xi}\right\}$ and $\zeta<\beta / 2$. Then for every $\delta, 0<\delta<\min _{1 \leq l \leq d} \pi / s_{l}$, there exist positive constants $b_{5}$ and $\gamma$, $0<\gamma<1$, such that

$$
\begin{equation*}
\left|\frac{\partial^{2}}{\partial w_{l}^{2}}\left\{\prod_{j, k \in \Xi} \phi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}(\omega)}\right\}\right| \leq b_{5} n(1-\gamma)^{(1 / 4) \beta n} \tag{4.13}
\end{equation*}
$$

when $|w| \geq \delta \sqrt{n}, w \in \sqrt{n}\left(\left[-\pi / s_{1}, \pi / s_{1}\right] \times \cdots \times\left[-\pi / s_{d}, \pi / s_{d}\right]\right)$ and $\omega \in \boldsymbol{A}_{n \zeta}$.
See, for a proof, Spitzer [10, p. 81].

## 5. Proof of Lemma $\mathbf{1 . 2}$

Suppose that the transition function $P(x, y)$ satisfies Assumption 1.1 through 1.6. Set $w=\sqrt{n} \theta$ in Lemma 4.1, then we have

$$
\begin{align*}
& \frac{|y-x|^{2}}{n} \frac{(2 \pi n)^{d / 2}}{(\# \Xi)} P_{n}(x, y)  \tag{5.1}\\
& =-\frac{1}{(2 \pi)^{d / 2}} \int_{\sqrt{n}\left(\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{s_{d}}, \frac{\pi}{s_{d}}\right]\right)} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \\
& \times \Delta_{w}\left\{\boldsymbol{E}\left[\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}}\right) \exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right]\right\} d w .
\end{align*}
$$

Take $0<\alpha, \zeta<\infty$ and $0<\delta<\min _{1 \leq l \leq d} \pi / s_{l}$. Decompose the right hand side of (5.1) as follows:

$$
\begin{aligned}
\frac{|y-x|^{2}}{n} & \frac{(2 \pi n)^{d / 2}}{(\# \Xi)} \\
& P_{n}(x, y)=J_{0}(n)+J_{1}(n, \alpha) \\
& +J_{2}(n, \alpha)+J_{3}(n, \alpha, \delta)+J_{4}(n, \delta, \zeta)+J_{5}(n, \delta, \zeta)+J_{6}(n, \delta, \zeta)+J_{7}(n, \delta, \zeta),
\end{aligned}
$$

where

$$
\begin{aligned}
& J_{0}(n)=-\frac{1}{(2 \pi)^{d / 2}} \int_{\mathbf{R}^{d}} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \Delta_{w}\left\{\exp \left\{-\frac{1}{2}(w, D w)\right\}\right\} \pi_{T(y)} d w, \\
& J_{1}(n, \alpha)=\frac{1}{(2 \pi)^{d / 2}} \int_{|w|>\alpha} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \Delta_{w}\left\{\exp \left\{-\frac{1}{2}(w, D w)\right\}\right\} \pi_{T(y)} d w \text {, } \\
& J_{2}(n, \alpha)=-\frac{1}{(2 \pi)^{d / 2}} \int_{|w| \leq \alpha} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\}\left(\Delta _ { w } \left\{\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right)\right.\right. \\
& \times \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right] \\
& \left.\left.-\exp \left\{-\frac{1}{2}(w, D w)\right\} \pi_{T(y)}\right\}\right) d w, \\
& J_{3}(n, \alpha, \delta)=-\frac{1}{(2 \pi)^{d / 2}} \int_{\alpha<|w| \leq \sqrt{n} \delta} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \\
& \times \Delta_{w}\left\{\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi q_{j} q_{j k}}\right)\right. \\
& \left.\times \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right]\right\} d w, \\
& J_{4}(n, \delta, \zeta)=\frac{1}{(2 \pi)^{d / 2}} \int_{|w| \leq \sqrt{n} \delta} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \\
& \times \Delta_{w}\left\{\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi q_{j, k}}\right)\right. \\
& \left.\times \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y), \boldsymbol{A}_{n \zeta}^{c} \mid \xi_{0}=T(x)\right]\right\} d w, \\
& J_{5}(n, \delta, \zeta)=\frac{1}{(2 \pi)^{d / 2}} \int_{|w| \leq \sqrt{n} \delta} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \\
& \times \Delta_{w}\left\{\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi q_{j} q_{j k}}\right)\right. \\
& \times \boldsymbol{E}\left[\left(1-\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}-n \pi_{j} q_{j k}}\right)\right)\right.
\end{aligned}
$$

$$
\begin{array}{r}
\left.\left.\times \exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y), \boldsymbol{A}_{n \zeta} \mid \xi_{0}=T(x)\right]\right\} d w \\
J_{6}(n, \delta, \zeta)=-\frac{1}{(2 \pi)^{d / 2}} \int_{|w|>\sqrt{n} \delta ; \sqrt{n}\left(\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{s_{d}}, \frac{\pi}{s_{d}}\right]\right)} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \\
\times \Delta_{w}\left\{\boldsymbol { E } \left[\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}}\right) \exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\}\right.\right. \\
\left.\left.\xi_{n}=T(y), \boldsymbol{A}_{n \zeta} \mid \xi_{0}=T(x)\right]\right\} d w
\end{array}
$$

and

$$
\begin{array}{r}
J_{7}(n, \delta, \zeta)=-\frac{1}{(2 \pi)^{d / 2}} \int_{\sqrt{n}\left(\left[-\frac{\pi}{s_{1}}, \frac{\pi}{s_{1}}\right] \times \cdots \times\left[-\frac{\pi}{\left.\left.s_{d}, \frac{\pi}{s_{d}}\right]\right)}\right.\right.} \exp \left\{-i \frac{1}{\sqrt{n}}(w, y-x)\right\} \\
\times \Delta_{w}\left\{\boldsymbol { E } \left[\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{N_{n}^{j k}}\right) \exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\}\right.\right. \\
\left.\left.\xi_{n}=T(y), \boldsymbol{A}_{n \zeta}^{c} \mid \xi_{0}=T(x)\right]\right\} d w
\end{array}
$$

A direct calculation shows that

$$
J_{0}(n)=\frac{|y-x|^{2}}{n} \exp \left\{-\frac{1}{2 n}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}
$$

Let us estimate remaining terms $J_{1}$ through $J_{7}$. We have

$$
\left|J_{1}(n, \alpha)\right| \leq \frac{1}{(2 \pi)^{d / 2}} \int_{|w|>\alpha}\left|\Delta_{w}\left\{\exp \left\{-\frac{1}{2}(w, D w)\right\}\right\}\right| \pi_{T(y)} d w
$$

which can be made arbitary small by taking $\alpha$ sufficiently large. We apply Lemmas $4.3,4.4$ and 4.6 to get an estimate of $J_{2}(n, \alpha)$ :

$$
\begin{aligned}
\left|J_{2}(n, \alpha)\right| \leq(2 \pi)^{-d / 2} \int_{|w| \leq \alpha} & \left\lvert\, \Delta_{w}\left\{\left(\prod_{j, k \in \Xi} \psi_{j k}\left(\frac{w}{\sqrt{n}}\right)^{n \pi_{j} q_{j k}}\right)\right.\right. \\
& \times \boldsymbol{E}\left[\exp \left\{i \frac{1}{\sqrt{n}}\left(w, M_{n}\right)\right\} ; \xi_{n}=T(y) \mid \xi_{0}=T(x)\right] \\
& \left.-\exp \left\{-\frac{1}{2}(w, D w)\right\} \pi_{T(y)}\right\} \mid d w \rightarrow 0 \quad \text { as } \quad n \rightarrow \infty
\end{aligned}
$$

By Lemmas 2.6, 4.4 and 4.6, we may choose a positive constant $c_{1}$ so that

$$
\left|J_{3}(n, \alpha, \delta)\right| \leq(2 \pi)^{-d / 2} c_{1} \int_{\alpha<|w|}\left(1+|w|^{2}\right) e^{-\lambda|w|^{2}} d w \rightarrow 0 \quad \text { as } \alpha \rightarrow \infty
$$

By Lemmas 4.4 and 4.7, there exists a positive constant $c_{2}$ such that $\left|J_{4}(n, \delta, \zeta)\right| \leq$ $c_{2} K n e^{-L n}$.

Using Lemmas $2.6,2.7,4.4,4.5$ and 4.6 , there exists a positive constant $c_{3}$ such that

$$
\left|J_{5}(n, \delta, \zeta)\right| \leq(2 \pi)^{-d / 2} c_{3} \zeta \int_{\boldsymbol{R}^{d}}\left(1+|w|^{4}\right) e^{-(1 / 2) \lambda|w|^{2}} d w \rightarrow 0 \quad \text { as } \zeta \rightarrow+0
$$

Take $\beta$ and $\zeta$ as in Lemma 4.8. Then by Lemma 4.8, there exist positive constants $c_{4}$ and $\gamma, 0<\gamma<1$, such that

$$
\left|J_{6}(n, \delta, \zeta)\right| \leq c_{4}(2 \pi n)^{d / 2} n(1-\gamma)^{n \beta / 4}
$$

By Lemma 2.3, there exists a positive constant $c_{5}$ such that

$$
\left|J_{7}(n, \delta, \zeta)\right| \leq c_{5} K(2 \pi n)^{d / 2} n e^{-L n}
$$

We see from the estimates given above that $J_{k}(1 \leq k \leq 7)$ tend to zero as $n \rightarrow \infty$ uniformly for $x, y$. This completes the proof of Lemma 1.2.

## 6. Some Lemmas for Theorems 1.1 and 1.2

Let $t$ be a positive integer. Set $Q^{t}=\left(q_{j k}^{(t)}\right)_{j, k \in \boldsymbol{\Xi}}$. Note that $q_{j k}^{(t)}=\sum_{T(x)=k} P_{t}(j, x)$. In a similar way to $F_{j k}(\cdot)$ we define, for $q_{j k}^{(t)}>0$

$$
F_{j k}^{(t)}(x)= \begin{cases}\frac{1}{q_{j k}^{(t)}} P_{t}(j, j+x) & \text { if } T(j+x)=k \\ 0 & \text { otherwise }\end{cases}
$$

and for $q_{j k}^{(t)}=0, F_{j k}^{(t)}(x)=1$ if $x=k-j$ and 0 otherwise.
Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 and 1.3. Then we may set $\mu_{j k ; l}^{(t)}=\sum_{x \in Z} x_{l} F_{j k}^{(t)}(x)$ and $G_{l}^{(t)}=\left(q_{j k}^{(t)} \mu_{j k ; l}^{(t)}\right)_{j, k \in \Xi}$ for $l, 1 \leq l \leq d$. Let $G_{l}^{(0)}, 1 \leq l \leq d$, be the null matrices.

Lemma 6.1. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 and 1.3. Then, for every positive integer $t$, we have

$$
\begin{equation*}
G_{l}^{(t)}=\sum_{n=0}^{t-1} Q^{n} G_{l}^{(1)} Q^{t-1-n} . \tag{6.1}
\end{equation*}
$$

Proof. The lemma is trivial for $t=1$. Let us consider for $t>1$. By the definition of $G_{l}^{(t)}$,

$$
\begin{equation*}
G_{l}^{(t)}=G_{l}^{(t-1)} Q+Q^{t-1} G_{l}^{(1)} \tag{6.2}
\end{equation*}
$$

Indeed,

$$
\begin{aligned}
q_{j k}^{(t)} \mu_{j k ; l}^{(t)}= & \sum_{j^{\prime} \in \Xi} \sum_{T\left(j+x^{\prime}\right)=j^{\prime}} x_{l}^{\prime} P_{t-1}\left(j, j+x^{\prime}\right) \sum_{T(j+x)=k} P\left(j+x^{\prime}, j+x\right) \\
& +\sum_{j^{\prime} \in \Xi} \sum_{T\left(j+x^{\prime}\right)=j^{\prime}} P_{t-1}\left(j, j+x^{\prime}\right) \sum_{T(j+x)=k}\left(x_{l}-x_{l}^{\prime}\right) P\left(j+x^{\prime}, j+x\right) \\
= & \sum_{j^{\prime} \in \Xi} q_{j j^{\prime}}^{(t-1)} \mu_{j j^{\prime} ; l}^{(t-1)} q_{j^{\prime} k}+\sum_{j^{\prime} \in \Xi} q_{j j^{\prime}}^{(t-1)} q_{j^{\prime} k} \mu_{j^{\prime} k ; l} .
\end{aligned}
$$

Suppose that the lemma is true for $t=t^{\prime}-1$. Then by (6.2) and the induction hypothesis, we have

$$
G_{l}^{\left(t^{\prime}\right)}=\sum_{n=0}^{t^{\prime}-2} Q^{n} G_{l}^{(1)} Q^{t^{\prime}-1-n}+Q^{t^{\prime}-1} G_{l}^{(1)}=\sum_{n=0}^{t^{\prime}-1} Q^{n} G_{l}^{(1)} Q^{t^{\prime}-1-n} .
$$

The proof now follows by mathematical induction.
Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1, 1.2 and 1.4. Denote by $\mathbf{1}$ the ( $\# \boldsymbol{\Xi}$ )-dimensional column vector with all the components equal to 1 . Then, by multiplying both sides (6.1) on the left by $\boldsymbol{\pi}$ and on the right by $\mathbf{1}$, we have

$$
\begin{equation*}
\sum_{j, k \in \Xi} \pi_{j} q_{j k}^{(t)} \mu_{j k ; l}^{(t)}=t \sum_{j, k \in \Xi} \pi_{j} q_{j k} \mu_{j k ; l} \quad \text { for } 1 \leq l \leq d . \tag{6.3}
\end{equation*}
$$

By Assumption 1.4, we may set $h_{j k: l m}^{(t)}=\sum_{x \in Z} x_{l} x_{m} F_{j k}^{(t)}(x), 1 \leq l, m \leq d$. Put $H_{l m}^{(t)}=$ $\left(q_{j k}^{(t)} h_{j k ; l m}^{(t)}\right)_{j, k \in \Xi}, G_{l m}^{(t)}=\left(q_{j k}^{(t)} \mu_{j k ; l}^{(t)} \mu_{j k ; m}^{(t)}\right)_{j, k \in \Xi}$ and

$$
c_{j k ; l m}^{(t)}=\sum_{x \in \mathbf{Z}}\left(x_{l}-\mu_{j k ; l}^{(t)}\right)\left(x_{m}-\mu_{j k ; m}^{(t)}\right) F_{j k}^{(t)}(x)
$$

for $1 \leq l, m \leq d$. Then we have

$$
\begin{equation*}
\sum_{j, k \in \Xi} \pi_{j} q_{j k}^{(t)} c_{j k ; l m}^{(t)}=\pi H_{l m}^{(t)} \mathbf{1}-\pi G_{l m}^{(t)} \mathbf{1} \tag{6.4}
\end{equation*}
$$

Let $H_{l m}^{(0)}$ and $G_{l m}^{(0)}, 1 \leq l, m \leq d$, be the null matrices.
Lemma 6.2. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 and 1.4. Then for every positive integer $t$,

$$
\begin{aligned}
H_{l m}^{(t)} & =\sum_{n=0}^{t-1} Q^{n} H_{l m}^{(1)} Q^{t-1-n} \\
& +\sum_{0 \leq n_{1} \leq t-2} \sum_{0 \leq n_{2} \leq t-2-n_{1}}\left(Q^{n_{2}} G_{l}^{(1)} Q^{t-2-n_{1}-n_{2}} G_{m}^{(1)} Q^{n_{1}}+Q^{n_{2}} G_{m}^{(1)} Q^{t-2-n_{1}-n_{2}} G_{l}^{(1)} Q^{n_{1}}\right)
\end{aligned}
$$

Proof. The lemma is trivial for $t=1$. By analogous way to (6.2), we have

$$
\begin{equation*}
H_{l m}^{(t)}=H_{l m}^{(t-1)} Q+Q^{t-1} H_{l m}^{(1)}+G_{l}^{(t-1)} G_{m}^{(1)}+G_{m}^{(t-1)} G_{l}^{(1)} \tag{6.5}
\end{equation*}
$$

for every positive integer $t$. Suppose that the lemma is true for $t=t^{\prime}-1$. Then by (6.5) and the induction hypothesis, we have

$$
\begin{aligned}
H_{l m}^{\left(t^{\prime}\right)}= & \left(\sum_{n=0}^{t^{\prime}-2} Q^{n} H_{l m}^{(1)} Q^{t^{\prime}-2-n}+\sum_{0 \leq n_{1} \leq t^{\prime}-3} \sum_{0 \leq n_{2} \leq t^{\prime}-3-n_{1}}\left(Q^{n_{2}} G_{l}^{(1)} Q^{t^{\prime}-3-n_{1}-n_{2}} G_{m}^{(1)} Q^{n_{1}}\right.\right. \\
& \left.\left.+Q^{n_{2}} G_{m}^{(1)} Q^{t^{\prime}-3-n_{1}-n_{2}} G_{l}^{(1)} Q^{n_{1}}\right)\right) Q+Q^{t^{\prime}-1} H_{l m}^{(1)} \\
& +\left(\sum_{n=0}^{t^{\prime}-2} Q^{n} G_{l}^{(1)} Q^{t^{\prime}-2-n}\right) G_{m}^{(1)}+\left(\sum_{n=0}^{t^{\prime}-2} Q^{n} G_{m}^{(1)} Q^{t^{\prime}-2-n}\right) G_{l}^{(1)} \\
= & \sum_{n=0}^{t^{\prime}-1} Q^{n} H_{l m}^{(1)} Q^{t^{\prime}-1-n}+\sum_{n_{1}=0}^{t^{\prime}-2} \sum_{n_{2}=0}^{t^{\prime}-2-n_{1}} Q^{n_{2}} G_{l}^{(1)} Q^{t^{\prime}-2-n_{1}-n_{2}} G_{m}^{(1)} Q^{n_{1}} \\
& +\sum_{n_{1}=0}^{t^{\prime}-2} \sum_{n_{2}=0}^{t^{\prime}-2-n_{1}} Q^{n_{2}} G_{m}^{(1)} Q^{t^{\prime}-2-n_{1}-n_{2}} G_{l}^{(1)} Q^{n_{1}} .
\end{aligned}
$$

The proof follows by mathematical induction.

Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1, 1.2 and 1.4. Then, by (6.4) and Lemma 6.2, we have, for every positive integer $t$,
(6.6) $\sum_{j, k \in \Xi} \pi_{j} q_{j k}^{(t)} c_{j k ; l m}^{(t)}$

$$
=t \boldsymbol{\pi} H_{l m}^{(1)} \mathbf{1}+\boldsymbol{\pi} \sum_{0 \leq n \leq t-2}(t-1-n)\left(G_{l}^{(1)} Q^{n} G_{m}^{(1)}+G_{m}^{(1)} Q^{n} G_{l}^{(1)}\right) \mathbf{1}-\boldsymbol{\pi} G_{l m}^{(t)} \mathbf{1}
$$

Lemma 6.3. Suppose that $Q$ is ergodic. Then $(I-Q+\Pi)$ has its inverse matrix, and $(I-Q+\Pi)^{-1}=\sum_{n=0}^{\infty}(Q-\Pi)^{n}$.

See, for a proof, Hatori and Mori [3, p. 107].
Suppose that $Q$ is ergodic. Let $t$ be a positive integer. Then, by Lemma 6.3, we may define

$$
\begin{equation*}
Z^{(t)}=\left(z_{j k}^{(t)}\right)_{j, k \in \Xi}=\left(I-Q^{t}+\Pi\right)^{-1}=\sum_{n^{\prime}=0}^{\infty}\left(Q^{t}-\Pi\right)^{n^{\prime}} \tag{6.7}
\end{equation*}
$$

and we have

$$
\begin{equation*}
Z^{(t)} \Pi=\Pi Z^{(t)}=\Pi . \tag{6.8}
\end{equation*}
$$

Define $Z=Z^{(1)}$. Set
$\mu_{j k}^{(t)}=\left(\mu_{j k ; 1}^{(t)}, \ldots, \mu_{j k ; d}^{(t)}\right), \quad Q^{(t)}(\theta)=\left(q_{j k}^{(t)} e^{i\left(\mu_{j k}^{(t)}, \theta\right)}\right)_{j, k \in \Xi} \quad$ and $\quad f^{(t)}(\theta, z)=\left|z I-Q^{(t)}(\theta)\right|$
for $\theta \in \boldsymbol{R}^{d}$ and $z \in \boldsymbol{C}$. Note that $Q^{(t)}(\mathbf{0})=Q^{t}$. By (1.4), $\left(\partial f^{(t)} / \partial z\right)(\mathbf{0}, 1) \neq 0$. Thus we may set

$$
b_{l m}^{(t)}=\frac{\partial^{2} f^{(t)}}{\partial \theta_{l} \partial \theta_{m}}(\mathbf{0}, 1) / \frac{\partial f^{(t)}}{\partial z}(\mathbf{0}, 1) \quad \text { and } \quad B^{(t)}=\left(b_{l m}^{(t)}\right)_{1 \leq l, m \leq d} .
$$

Lemma 6.4. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4. Then

$$
\begin{equation*}
b_{l m}^{(t)}=\pi\left(G_{l m}^{(t)}+G_{l}^{(t)} Z^{(t)} G_{m}^{(t)}+G_{m}^{(t)} Z^{(t)} G_{l}^{(t)}\right) \mathbf{1} \tag{6.9}
\end{equation*}
$$

for every positive integer $t$.
Proof. Let $\left\{\xi_{n}^{(t)}\right\}_{n \geq 0}$ be a Markov chain on $\boldsymbol{\Xi}$ with the transition matrix $Q^{t}$. Set (6.10) $N_{n}^{(t) j k}=\#\left\{1 \leq n^{\prime} \leq n \mid \xi_{n^{\prime}-1}^{(t)}=j, \xi_{n^{\prime}}^{(t)}=k\right\} \quad$ and $\quad M_{n ; l}^{(t)}=\sum_{j, k \in \Xi} \mu_{j k ; l}^{(t)} N_{n}^{(t) j k}$.

Under Assumptions 1.1 and 1.2, $Q^{t}$ is ergodic. Moreover, by (6.3) we have

$$
\sum_{j, k \in \Xi} \pi_{j} q_{j k}^{(t)} \mu_{j k, l}^{(t)}=\mathbf{0} \quad \text { for } 1 \leq l \leq d
$$

Thus we may apply Lemma 4.2 to $\left\{\xi_{n}^{(t)}\right\}_{n \geq 0}$ to have

$$
\begin{equation*}
b_{l m}^{(t)}=\lim _{n \rightarrow \infty} \frac{1}{\pi_{k} n} \boldsymbol{E}\left[M_{n ; l}^{(t)} M_{n ; m}^{(t)} ; \quad \xi_{n}^{(t)}=k \mid \xi_{0}^{(t)}=j\right], \quad 1 \leq l, m \leq d . \tag{6.11}
\end{equation*}
$$

By analogous way to Hatori and Mori [3, p. 123], in which they treated the case that $d=1$, we may see that the right hand side of (6.11) equals the right hand side of (6.9). Thus we obtain (6.9).

Lemma 6.5. If $Q$ is ergodic, then $Z Q^{n}=-\sum_{n^{\prime}=0}^{n-1} Q^{n^{\prime}}+n \Pi+Z$.
Proof. By (6.7) and (6.8), we have

$$
\begin{equation*}
Z Q=Z-I+\Pi . \tag{6.12}
\end{equation*}
$$

Therefore the lemma is true for $n=1$. Suppose that the lemma is true for $n=n^{\prime}-1$.
Then

$$
Z Q^{n^{\prime}}=\left(Z Q^{n^{\prime}-1}\right) Q=-\sum_{n^{\prime \prime}=0}^{n^{\prime}-1} Q^{n^{\prime \prime}}+n^{\prime} \Pi+Z
$$

The proof follows by mathematical induction.

Lemma 6.6. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4. Then for every positive integer $t$,

$$
\begin{align*}
b_{l m}^{(t)}= & \boldsymbol{\pi} G_{l m}^{(t)} \mathbf{1}-\boldsymbol{\pi} \sum_{0 \leq n \leq t-2}(t-1-n)\left(G_{l}^{(1)} Q^{n} G_{m}^{(1)}+G_{m}^{(1)} Q^{n} G_{l}^{(1)}\right) \mathbf{1}  \tag{6.13}\\
& +t \boldsymbol{\pi} G_{l}^{(1)} Z G_{m}^{(1)} \mathbf{1}+t \boldsymbol{\pi} G_{m}^{(1)} Z G_{l}^{(1)} \mathbf{1}
\end{align*}
$$

Proof. By Lemma 6.1, we have

$$
\begin{equation*}
\boldsymbol{\pi} G_{l}^{(t)} \boldsymbol{Z}^{(t)} G_{m}^{(t)} \mathbf{1}=\boldsymbol{\pi} G_{l}^{(1)}\left(\sum_{n^{\prime}=0}^{t-1} Q^{n^{\prime}}\right) Z^{(t)}\left(\sum_{n^{\prime \prime}=0}^{t-1} Q^{n^{\prime \prime}}\right) G_{m}^{(1)} \mathbf{1} \tag{6.14}
\end{equation*}
$$

Ву (6.7),

$$
\begin{equation*}
\left(Z^{(t)}\right)^{-1}=Z^{-1}+Q-Q^{t} \tag{6.15}
\end{equation*}
$$

Multiply both sides (6.15) on the left by $Z$, and on the right by $Z^{(t)}$. Thus we obtain

$$
\begin{equation*}
Z=Z^{(t)}+\sum_{1 \leq n \leq t-1} Z(I-Q) Q^{n} Z^{(t)} \tag{6.16}
\end{equation*}
$$

By applying (6.8) and (6.12) to (6.16),

$$
\begin{equation*}
Z=\left(\sum_{n=0}^{t-1} Q^{n}\right) Z^{(t)}-(t-1) \Pi \tag{6.17}
\end{equation*}
$$

By multiplying both sides (6.17) on the right by $\sum_{n=0}^{t-1} Q^{n}$, we obtain

$$
\left(\sum_{n=0}^{t-1} Q^{n}\right) Z^{(t)}\left(\sum_{n=0}^{t-1} Q^{n}\right)=\sum_{n=0}^{t-1} Z Q^{n}+t(t-1) \Pi
$$

By Lemma 6.5, we have

$$
\begin{equation*}
\left(\sum_{n=0}^{t-1} Q^{n}\right) Z^{(t)}\left(\sum_{n=0}^{t-1} Q^{n}\right)=-\sum_{0 \leq n \leq t-2}(t-n-1) Q^{n}+\frac{3}{2} t(t-1) \Pi+t Z \tag{6.18}
\end{equation*}
$$

Substitute (6.18) to (6.14), and note Assumption 1.3. Thus we have

$$
\boldsymbol{\pi} G_{l}^{(t)} Z^{(t)} G_{m}^{(t)} \mathbf{1}=-\pi \sum_{0 \leq n \leq t-2}(t-n-1) G_{l}^{(1)} Q^{n} G_{m}^{(1)} \mathbf{1}+t \boldsymbol{\pi} G_{l}^{(1)} Z G_{m}^{(1)} \mathbf{1} .
$$

By Lemma 6.4, we obtain (6.13). The proof is complete.
Set $C_{j k}^{(t)}=\left(c_{j k ; l m}^{(t)}\right)_{1 \leq l, m \leq d}$ and $D^{(t)}=\sum_{j, k \in \Xi} \pi_{j} q_{j k}^{(t)} C_{j k}^{(t)}+B^{(t)}$. Thus by (6.6) and Lemma 6.6, we have the following lemma.

Lemma 6.7. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4. Then for every positive integer $t, D^{(t)}=t D$.

Lemma 6.8. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4. Put

$$
t_{0}=\max \left\{n_{0}(\mathbf{0}, \mathbf{0}), n_{0}\left(\mathbf{0}, \pm s_{l} \boldsymbol{e}_{l}\right), 1 \leq l \leq d\right\} .
$$

Then the transition function defined by $P^{\prime}(x, y)=P_{t_{0}}(x, y)$ satisfies Assumptions 1.1 through 1.6.

The proof is omitted.
Lemma 6.9. Suppose that the transition function $P(x, y)$ satisfies Assumptions 1.1 through 1.4. Let $t_{0}$ be as in Lemma 6.8. Then we have
(6.19) $\lim _{n \rightarrow \infty}\left(\left(2 \pi n t_{0}\right)^{d / 2} P_{n t_{0}}(x, y)\right.$

$$
\left.-(\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}\right)=0
$$

and
(6.20) $\lim _{n \rightarrow \infty} \frac{|y-x|^{2}}{n t_{0}}\left(\left(2 \pi n t_{0}\right)^{d / 2} P_{n t_{0}}(x, y)\right.$
$\left.-(\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}\right)=0$
uniformly for $x, y \in \mathbf{Z}^{d}$, where $D$ is positive definite.

Proof. Since $P^{\prime}(x, y)$ in Lemma 6.8 satisfies Assumptions 1.1 through 1.6, we have from Lemma $1.1(2 \pi n)^{d / 2} P_{n}^{\prime}(x, y)$ converges to

$$
(\# \boldsymbol{\Xi})\left|D^{\left(t_{0}\right)}\right|^{-1 / 2} \exp \left\{-\frac{1}{2 n}\left(y-x,\left(D^{\left(t_{0}\right)}\right)^{-1}(y-x)\right)\right\} \pi_{T(y)}
$$

uniformly for $x, y \in Z^{d}$ and $D^{\left(t_{0}\right)}$ is positive definite. By Lemma 6.7, $D$ is positive definite and (6.19) holds. Similary, by Lemma 1.2, we obtain (6.20).

## 7. Proof of Theorems $\mathbf{1 . 1}$ and 1.2

Suppose that the transition function $P(x, y)$ satisfies Assumption 1.1 through 1.4. Let $t_{0}$ be the positive integer given in Lemma 6.8. In order to prove Theorem 1.1, it suffices to show that

$$
\begin{aligned}
\lim _{n \rightarrow \infty} & \sup _{x, y \in Z^{d}} \mid\left(2 \pi\left(n t_{0}+n^{\prime}\right)\right)^{d / 2} P_{n t_{0}+n^{\prime}}(x, y) \\
& \left.-(\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2\left(n t_{0}+n^{\prime}\right)}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)} \right\rvert\,=0
\end{aligned}
$$

for every $n^{\prime}, 0 \leq n^{\prime} \leq t_{0}-1$. By Lemma 6.9 , we may write

$$
\begin{aligned}
&\left(2 \pi\left(n t_{0}+n^{\prime}\right)\right)^{d / 2} P_{n t_{0}+n^{\prime}}(x, y) \\
&=(\# \Xi)|D|^{-1 / 2} \exp \left\{-\frac{1}{2\left(n t_{0}+n^{\prime}\right)}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)} \\
&+I_{1}^{\prime}(n)+I_{2}^{\prime}(n)+o(1),
\end{aligned}
$$

where

$$
\begin{aligned}
I_{1}^{\prime}(n)= & (\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)} \\
& -(\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2\left(n t_{0}+n^{\prime}\right)}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}
\end{aligned}
$$

and

$$
\begin{aligned}
I_{2}^{\prime}(n)= & (\# \boldsymbol{\Xi})|D|^{-1 / 2} \sum_{x^{\prime} \in \mathbf{Z}^{d}} P_{n^{\prime}}\left(x, x^{\prime}\right) \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x^{\prime}, D^{-1}\left(y-x^{\prime}\right)\right)\right\} \pi_{T(y)} \\
& -(\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)},
\end{aligned}
$$

and $o(1)$ tends to zero as $n \rightarrow \infty$ uniformly for $x, y$. We will show that the terms $I_{1}^{\prime}$ and $I_{2}^{\prime}$ go to zero uniformly in $x, y$ as $n \rightarrow \infty$.

It follows from the inequality $\left|e^{-y}-e^{-x}\right| \leq e^{-x}|y-x|$ for $y>x>0$ that $\left|I_{1}^{\prime}(n)\right| \leq a_{1}^{\prime} / n$, where $a_{1}^{\prime}$ is a positive constant.

Since $D$ is a symmetric matrix and positive definite, all its eigenvalues $\left\{\lambda_{l}\right\}_{1 \leq l \leq d}$ are positive and there exists an orthogonal matrix $U=\left(u_{l m}\right)_{1 \leq l, m \leq d}$ such that

$$
\begin{equation*}
D=U \Lambda U^{*} \tag{7.1}
\end{equation*}
$$

where $\Lambda=\operatorname{diag}\left\{\lambda_{1} \ldots \lambda_{d}\right\}$ and $U^{*}$ is the transposed matrix of $U$. Then we have

$$
\begin{aligned}
& \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x^{\prime}, D^{-1}\left(y-x^{\prime}\right)\right)\right\}-\exp \left\{-\frac{1}{2 n t_{0}}\left(y-x, D^{-1}(y-x)\right)\right\} \\
& =\sum_{l^{\prime}=1}^{d}\left(\exp \left\{-\frac{1}{2 n t_{0} \lambda_{l^{\prime}}}\left(\sum_{m=1}^{d} u_{m l^{\prime}}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2}\right\}\right. \\
& \left.\quad-\exp \left\{-\frac{1}{2 n t_{0} \lambda_{l^{\prime}}}\left(\sum_{m=1}^{d} u_{m l^{\prime}}\left(y_{m}-x_{m}\right)\right)^{2}\right\}\right) \\
& \quad \times \exp \left\{-\frac{1}{2 n t_{0}} \sum_{1 \leq l \leq l^{\prime}-1} \frac{1}{\lambda_{l}}\left(\sum_{m=1}^{d} u_{m l}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2}\right. \\
& \left.-\frac{1}{2 n t_{0}} \sum_{l^{\prime}+1 \leq l \leq d} \frac{1}{\lambda_{l}}\left(\sum_{m=1}^{d} u_{m l}\left(y_{m}-x_{m}\right)\right)^{2}\right\} .
\end{aligned}
$$

Thus

$$
\begin{aligned}
\left|I_{2}^{\prime}(n)\right| \leq(\# \boldsymbol{\Xi})|D|^{-1 / 2} \sum_{x^{\prime} \in \boldsymbol{Z}^{d}} P_{n^{\prime}}\left(x, x^{\prime}\right) \sum_{l^{\prime}=1}^{d} \mid & \exp \left\{-\frac{1}{2 n t_{0} \lambda_{l^{\prime}}}\left(\sum_{m=1}^{d} u_{m l^{\prime}}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2}\right\} \\
& \left.-\exp \left\{-\frac{1}{2 n t_{0} \lambda_{l^{\prime}}}\left(\sum_{m=1}^{d} u_{m l^{\prime}}\left(y_{m}-x_{m}\right)\right)^{2}\right\} \right\rvert\, \pi_{T(y)}
\end{aligned}
$$

Note that

$$
\begin{equation*}
\left|e^{-y^{2} / n}-e^{x^{2} / n}\right|=\left|\int_{y}^{x} 2 \frac{v}{n} e^{-v^{2} / n} d v\right| \leq a_{2}^{\prime} \frac{1}{\sqrt{n}}|y-x| \tag{7.2}
\end{equation*}
$$

where $a_{2}^{\prime}$ is positive constant. Thus, by Assumption 1.3, there exists positive constant $a_{3}^{\prime}$ such that $\left|I_{2}^{\prime}(n)\right| \leq a_{3}^{\prime} / \sqrt{n}$. The proof is complete.

In order to prove the Theorem 1.2, it suffices to show that

$$
\begin{aligned}
& \left.\lim _{n \rightarrow \infty} \frac{1}{n t_{0}+n^{\prime}} \sup _{x, y \in Z^{d}}|y-x|^{2} \right\rvert\,\left(2 \pi\left(n t_{0}+n^{\prime}\right)\right)^{d / 2} P_{n t_{0}+n^{\prime}}(x, y) \\
& \left.\quad-(\# \Xi)|D|^{-1 / 2} \exp \left\{-\frac{1}{2\left(n t_{0}+n^{\prime}\right)}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)} \right\rvert\,=0
\end{aligned}
$$

for every $n^{\prime}, 0 \leq n^{\prime} \leq t_{0}-1$. We may write

$$
\begin{aligned}
& \frac{|y-x|^{2}}{n t_{0}+n^{\prime}}\left(\left(2 \pi\left(n t_{0}+n^{\prime}\right)\right)^{d / 2} P_{n t_{0}+n^{\prime}}(x, y)\right. \\
& \left.\quad-(\# \Xi)|D|^{-1 / 2} \exp \left\{-\frac{1}{2\left(n t_{0}+n^{\prime}\right)}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}\right) \\
& \quad=J_{1}^{\prime}(n)+J_{2}^{\prime}(n)+J_{3}^{\prime}(n)+J_{4}^{\prime}(n)
\end{aligned}
$$

where

$$
\begin{aligned}
J_{1}^{\prime}(n)= & \frac{|y-x|^{2}}{n t_{0}+n^{\prime}}\left(\frac{n t_{0}+n^{\prime}}{n t_{0}}\right)^{d / 2} \sum_{x^{\prime} \in Z^{d}} P_{n^{\prime}}\left(x, x^{\prime}\right)\left(\left(2 \pi n t_{0}\right)^{d / 2} P_{n t_{0}}\left(x^{\prime}, y\right)\right. \\
& \left.-(\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x^{\prime}, D^{-1}\left(y-x^{\prime}\right)\right)\right\} \pi_{T(y)}\right), \\
J_{2}^{\prime}(n)= & \frac{|y-x|^{2}}{n t_{0}+n^{\prime}}(\# \boldsymbol{\Xi})|D|^{-1 / 2} \sum_{x^{\prime} \in \mathbf{Z}^{d}} P_{n^{\prime}}\left(x, x^{\prime}\right) \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x^{\prime}, D^{-1}\left(y-x^{\prime}\right)\right)\right\} \pi_{T(y)} \\
& -\frac{|y-x|^{2}}{n t_{0}+n^{\prime}}(\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}, \\
J_{3}^{\prime}(n)= & (\# \boldsymbol{\Xi})|D|^{-1 / 2} \frac{|y-x|^{2}}{n t_{0}+n^{\prime}} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)} \\
& -(\# \boldsymbol{\Xi})|D|^{-1 / 2} \frac{|y-x|^{2}}{n t_{0}+n^{\prime}} \exp \left\{-\frac{1}{2\left(n t_{0}+n^{\prime}\right)}\left(y-x, D^{-1}(y-x)\right)\right\} \pi_{T(y)}, \\
J_{4}^{\prime}(n)= & \left(\left(\frac{n t_{0}+n^{\prime}}{n t_{0}}\right)^{d / 2}-1\right)(\# \Xi)|D|^{-1 / 2} \frac{|y-x|^{2}}{n t_{0}+n^{\prime}} \\
& \times \sum_{x^{\prime} \in Z^{d}} P_{n^{\prime}}\left(x, x^{\prime}\right) \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x^{\prime}, D^{-1}\left(y-x^{\prime}\right)\right)\right\} \pi_{T(y) .} .
\end{aligned}
$$

We will show that the terms $J_{1}^{\prime}, J_{2}^{\prime}, J_{3}^{\prime}$ and $J_{4}^{\prime}$ go to zero uniformly for $x, y$ as $n \rightarrow \infty$.

Note that

$$
\begin{equation*}
|y-x|^{2} \leq 2\left|y-x^{\prime}\right|^{2}+2\left|x^{\prime}-x\right|^{2} \tag{7.3}
\end{equation*}
$$

Thus, by Lemma 6.9 and Assumption 1.4, there exist positive constants $b_{1}^{\prime}$ and $b_{2}^{\prime}$ such that

$$
\begin{aligned}
& \left.\left|J_{1}^{\prime}(n)\right| \leq b_{1}^{\prime} \frac{1}{n t_{0}} \sup _{y, x^{\prime} \in Z^{d}}\left|y-x^{\prime}\right|^{2} \right\rvert\,\left(2 \pi n t_{0}\right)^{d / 2} P_{n t_{0}}\left(x^{\prime}, y\right) \\
& \left.-(\# \boldsymbol{\Xi})|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x^{\prime}, D^{-1}\left(y-x^{\prime}\right)\right)\right\} \pi_{T(y)} \right\rvert\,
\end{aligned}
$$

$$
\begin{aligned}
& \left.+b_{2}^{\prime} \frac{1}{n t_{0}} \sup _{y, x^{\prime} \in \mathbb{Z}^{d}} \right\rvert\,\left(2 \pi n t_{0}\right)^{d / 2} P_{n t_{0}}\left(x^{\prime}, y\right) \\
& \left.-(\# \Xi)|D|^{-1 / 2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x^{\prime}, D^{-1}\left(y-x^{\prime}\right)\right)\right\} \pi_{T(y)} \right\rvert\, \rightarrow 0 \\
& \text { as } n \rightarrow \infty
\end{aligned}
$$

Since $|y-x|^{2}=\left|y-x^{\prime}\right|^{2}+\left(|y-x|^{2}-\left|y-x^{\prime}\right|^{2}\right)$, we have $J_{2}^{\prime}(n) \leq J_{21}^{\prime}(n)+J_{22}^{\prime}(n)$, where

$$
\begin{aligned}
& \begin{aligned}
J_{21}^{\prime}(n)= & (\# \boldsymbol{\Xi})|D|^{-1 / 2} \sum_{x^{\prime} \in Z^{d}}
\end{aligned} P_{n^{\prime}}\left(x, x^{\prime}\right) \frac{| | y-\left.x\right|^{2}-\left|y-x^{\prime}\right|^{2} \mid}{n t_{0}+n^{\prime}} \\
& \quad \times \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x^{\prime}, D^{-1}\left(y-x^{\prime}\right)\right)\right\} \pi_{T(y)}, \\
& J_{22}^{\prime}(n)=(\# \boldsymbol{\Xi})|D|^{-1 / 2} \\
& \times \sum_{x^{\prime} \in \boldsymbol{Z}^{d}} P_{n^{\prime}}\left(x, x^{\prime}\right) \frac{1}{n t_{0}+n^{\prime}}| | y-\left.x^{\prime}\right|^{2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x^{\prime}, D^{-1}\left(y-x^{\prime}\right)\right)\right\} \\
& \left.\quad|y-x|^{2} \exp \left\{-\frac{1}{2 n t_{0}}\left(y-x, D^{-1}(y-x)\right)\right\} \right\rvert\, \pi_{T(y) .}
\end{aligned}
$$

Note that the inequality $\left||y-x|^{2}-\left|y-x^{\prime}\right|^{2}\right| \leq\left|x^{\prime}-x\right|^{2}+2\left|y-x^{\prime}\right|\left|x^{\prime}-x\right|$. Thus, by Assumption 1.4, there exists a positive constant $b_{3}^{\prime}$ such that $J_{21}^{\prime}(n) \leq b_{3}^{\prime} n^{-1 / 2}$.

By (7.1), the right hand side of $J_{22}^{\prime}(n)$ equals

$$
\begin{aligned}
& \text { (\#छ)|D}\left.\right|^{-1 / 2} \sum_{x^{\prime} \in \boldsymbol{Z}^{d}} P_{n^{\prime}}\left(x, x^{\prime}\right) \frac{1}{n t_{0}+n^{\prime}} \\
& \quad \times \left\lvert\,\left(\sum_{l=1}^{d}\left(\sum_{m=1}^{d} u_{m l}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2}\right) \exp \left\{-\frac{1}{2 n t_{0}} \sum_{l=1}^{d} \frac{1}{\lambda_{l}}\left(\sum_{m=1}^{d} u_{m l}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2}\right\}\right. \\
& \left.\quad-\left(\sum_{l=1}^{d}\left(\sum_{m=1}^{d} u_{m l}\left(y_{m}-x_{m}\right)\right)^{2}\right) \exp \left\{-\frac{1}{2 n t_{0}} \sum_{l=1}^{d} \frac{1}{\lambda_{l}}\left(\sum_{m=1}^{d} u_{m l}\left(y_{m}-x_{m}\right)\right)^{2}\right\} \right\rvert\, .
\end{aligned}
$$

Note that

$$
\begin{aligned}
& \left(\sum_{l=1}^{d} x_{l}^{2}\right) \exp \left\{-\sum_{l=1}^{d} \frac{1}{\lambda_{l}} x_{l}^{2}\right\}-\left(\sum_{l=1}^{d} y_{l}^{2}\right) \exp \left\{-\sum_{l=1}^{d} \frac{1}{\lambda_{l}} y_{l}^{2}\right\} \\
& \quad=\sum_{l_{1}=1}^{d} x_{l_{1}}^{2} \exp \left\{-\frac{1}{\lambda_{l_{1}}} x_{l_{1}}^{2}\right\} \sum_{\substack{1 \leq l_{2} \leq d \\
l_{2} \neq l_{1}}}\left(\exp \left\{-\frac{1}{\lambda_{l_{2}}} x_{l_{2}}^{2}\right\}-\exp \left\{-\frac{1}{\lambda_{l_{2}}} y_{l_{2}}^{2}\right\}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \times \exp \left\{-\sum_{\substack{1 \leq l_{3} \leq l_{2}-1 \\
l_{3} \neq l_{1}}} \frac{1}{\lambda_{l_{3}}} x_{l_{3}}^{2}-\sum_{\substack{l_{2}+1 \leq l_{l_{1} \leq d} \leq d \\
l_{4} \not l_{1}}} \frac{1}{\lambda_{l_{4}}} y_{l_{4}}^{2}\right\} \\
& +\sum_{m_{1}=1}^{d}\left(x_{m_{1}}^{2} \exp \left\{-\frac{1}{\lambda_{m_{1}}} x_{m_{1}}^{2}\right\}-y_{m_{1}}^{2} \exp \left\{-\frac{1}{\lambda_{m_{1}}} y_{m_{1}}^{2}\right\}\right) \exp \left\{-\sum_{\substack{1 \leq m_{2} \leq d \\
m_{2} \neq m_{1}}} \frac{1}{\lambda_{m_{2}}} y_{m_{2}}^{2}\right\} .
\end{aligned}
$$

Thus we have

$$
\begin{aligned}
& J_{22}^{\prime}(n) \leq(\# \boldsymbol{\Xi})|D|^{-1 / 2} \frac{1}{n t_{0}+n^{\prime}} \sum_{x^{\prime} \in \boldsymbol{Z}^{d}} P_{n^{\prime}}\left(x, x^{\prime}\right) \\
& \quad \times \sum_{l_{1}=1}^{d}\left(\sum_{m=1}^{d} u_{m l_{1}}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2} \exp \left\{-\frac{1}{2 n t_{0} \lambda_{l_{1}}}\left(\sum_{m=1}^{d} u_{m l_{1}}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2}\right\} \\
& \quad \times \sum_{\substack{1 \leq l_{2} \leq d \\
l_{2} \neq l_{1}}} \left\lvert\, \exp \left\{-\frac{1}{2 n t_{0} \lambda_{l_{2}}}\left(\sum_{m=1}^{d} u_{m l_{2}}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2}\right\}\right. \\
& \left.\quad-\exp \left\{-\frac{1}{2 n t_{0} \lambda_{l_{2}}}\left(\sum_{m=1}^{d} u_{m l_{2}}\left(y_{m}-x_{m}\right)\right)^{2}\right\} \right\rvert\, \pi_{T(y)} \\
& \quad+(\# \boldsymbol{\Xi})|D|^{-1 / 2} \frac{1}{n t_{0}+n^{\prime}} \sum_{x^{\prime} \in \mathbf{Z}^{d}} P_{n^{\prime}}\left(x, x^{\prime}\right) \\
& \quad \times \sum_{l_{3}=1}^{d} \left\lvert\,\left(\sum_{m=1}^{d} u_{m l_{3}}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2} \exp \left\{-\frac{1}{2 n t_{0} \lambda_{l_{3}}}\left(\sum_{m=1}^{d} u_{m l_{3}}\left(y_{m}-x_{m}^{\prime}\right)\right)^{2}\right\}\right. \\
& \left.\quad-\left(\sum_{m=1}^{d} u_{m l_{3}}\left(y_{m}-x_{m}\right)\right)^{2} \exp \left\{-\frac{1}{2 n t_{0} \lambda_{l_{3}}}\left(\sum_{m=1}^{d} u_{m l_{3}}\left(y_{m}-x_{m}\right)\right)^{2}\right\} \right\rvert\, \pi_{T(y)} .
\end{aligned}
$$

Noting (7.2) and that $\left|y^{2} e^{-(1 / n) y^{2}}-x^{2} e^{-(1 / n) x^{2}}\right| \leq b_{4}^{\prime} \sqrt{n}|y-x|$, where $b_{4}^{\prime}$ is a positive constant, we see that there exists a positive constant $b_{5}^{\prime}$ such that $J_{22}^{\prime}(n) \leq b_{5}^{\prime} / \sqrt{n}$.

By analogous way to $I_{1}^{\prime}(n)$ there exists a positive constant $b_{6}^{\prime}$ such that $\left|J_{3}^{\prime}(n)\right| \leq$ $b_{6}^{\prime} / n$.

Since $x^{2} e^{-x^{2}}$ is bounded, by (7.3) there exists a positive constant $b_{7}^{\prime}$ such that $\left|J_{4}^{\prime}(n)\right| \leq b_{7}^{\prime} / n$. The proof is complete.

Remark. Consider a RWPE on $\boldsymbol{Z}^{d}$ with the transition function $P(x, y)$, where $P(x, y)>0$ if $y=x \pm e_{l}, 1 \leq l \leq d$, and $P(x, y)=0$ otherwise. Such a $R W P E$ does not satisfy Assumption 1.2. Nevertheless, for 1 and 2-dimensional case, by modifying the transition function we may apply Theorems 1.1 and 1.2 to the RWPE. For 1-dimensional case, we may assume that its period $s$ is even. Set $P^{\prime}(x, y)=$
$P_{2}(2 x, 2 y)$. Then $P^{\prime}(x, y)$ is a transition function on $Z$ with period $s / 2$ and satisfies Assumptions 1.1 through 1.4. For 2-dimensional case, we may assume that $s=(s, s)$. Set $S=\left(\begin{array}{cc}1 & -1 \\ 1 & 1\end{array}\right)$ and $P^{\prime}(x, y)=P_{2}(S x, S y)$. Then $P^{\prime}(x, y)$ is the transition function on $\boldsymbol{Z}^{2}$ with period $s$ and satisfies Assumptions 1.1 through 1.4.

Acknowledgements. The author wishes to thank Professor M. Shimura for posing the problem and for his valuable advice. The author also wishes to thank Professor T. Shiga and Professor S. Kotani for their helpful suggestions. Finally, the author wishes to thank the referee for helpful comments.
