We investigate the ruled surfaces generated by a straight line in Bishop frame moving along a spacelike curve in Minkowski 3-space. We obtain the distribution parameters, mean curvatures. We give some results and theorems related to be developable and minimal of them. Furthermore, we show that, if the base curve of the ruled surface is also an asymptotic curve and striction line, then the ruled surface is developable.

1. Introduction

Recently, the theory of surfaces and their transformations has been studied extensively in differential geometry. The ruled surfaces have been a powerful subject in the Minkowski space $\mathbb{R}_1^3$ for line geometry for a long time. In the literature, Kobayashi [1] was the first author to address this problem and examined minimal spacelike ruled surfaces in the Minkowski $\mathbb{R}_1^3$. Kim and Yoon [2] have classified the Lorentz surfaces.

Izumiya and Takeuchi [3] obtained some characterizations for ruled surfaces. Turgut and Hacısalıhoğlu [4, 5] defined spacelike ruled surfaces and obtained some characterizations in the three-dimensional Minkowski space. Yaylı [6] obtained the distribution parameter of a spacelike ruled surface generated by a spacelike straight line in Frenet frame along a spacelike curve. Yaylı and Saracoglu [7, 8] studied timelike and spacelike developable ruled surfaces in Minkowski space. Orbay and Aydemir [9] obtained the distribution parameter, mean curvature, and Gaussian curvature, and some new results and theorems were given for developable and minimal spacelike ruled surfaces.

In this paper, making use of the method in a paper of Yaylı [6], we obtained some characterizations for spacelike Ruled surfaces according to Bishop frame in Minkowski 3-space.

2. Preliminaries

Let $\mathbb{R}_1^3$ be a Minkowski 3-space with the metric tensor $I = \langle \cdot, \cdot \rangle = dx_1^2 - dx_2^2 + dx_3^2$. The norm of $v \in \mathbb{R}_1^3$ is defined by

$\|v\| = \sqrt{|\langle v, v \rangle|}$. A vector $v \in \mathbb{R}_1^3$ is said to be *spacelike* if $\langle v, v \rangle > 0$ or $v = 0$, *timelike* if $\langle v, v \rangle < 0$, and *lightlike (or null)* if $\langle v, v \rangle = 0$ and $v \neq 0$.

Let $\alpha : I \rightarrow \mathbb{R}_1^3$, $\alpha(s) = (\alpha_1(s), \alpha_2(s), \alpha_3(s))$ be a smooth regular curve in $\mathbb{R}_1^3$. We say that α is a spacelike (resp. timelike, lightlike) if $\alpha'(t)$, a spacelike (resp. timelike, lightlike) vector for all $s \in I \subset \mathbb{R}$.

A surface in the Minkowski 3-space is called a spacelike surface if the Lorentz metric on the surface is a positive definite [10]. A ruled surface is a surface swept out by a straight line X moving along a curve α . The various positions of the generating line X are called the rulings of the surface. Such a surface has a parametrization in the ruled form as follows:

$$\phi(s, v) = \alpha(s) + vX(s), \quad (1)$$

where α is the base curve and X is the director vector along α . If the tangent plane is constant along a fixed ruling, then the ruled surface is called a developable surface. The remaining ruled surfaces are called skew surfaces [4]. The spacelike ruled surface M in $\mathbb{R}_1^3$ is given by the parametrization

$$\begin{aligned} \phi: I \times \mathbb{R} &\longrightarrow \mathbb{R}_1^3 \\ (s, v) &\longrightarrow \phi(s, v) = \alpha(s) + vX(s), \end{aligned} \quad (2)$$

where $\alpha : I \rightarrow \mathbb{R}_1^3$ is a differentiable spacelike curve parametrized by its arc length in $\mathbb{R}_1^3$ and $X(s)$ is the director vector

of the director curve such that X is orthogonal the tangent vector field T of the base curve α .

Denote by $\{T, N, B\}$ the moving Frenet frame along the regular curve with arc-length parameter s . The Frenet trihedron consists of the tangent vector T , the principal normal vector N , and the binormal vector B . If α is a spacelike curve with a spacelike binormal, then the Frenet frame has the following properties:

$$\begin{aligned} T'(s) &= \kappa(s) N, \\ N'(s) &= \kappa(s) T(s) + \tau(s) B(s), \\ B'(s) &= \tau(s) N(s), \end{aligned} \quad (3)$$

where

$$\langle T, T \rangle = 1, \quad \langle N, N \rangle = -1, \quad \langle B, B \rangle = 1. \quad (4)$$

The Bishop frame or parallel transport frame is an alternative approach to defining a moving frame that is well defined even when the curve has a vanishing second derivative. One can express parallel transport of an orthonormal frame along a curve simply by parallel transporting each component of the frame. The tangent vector and any convenient arbitrary basis for the remainder of the frame are used.

Let us consider the *Bishop frame* $\{T, N_1, N_2\}$ of the spacelike curve $\alpha(s)$ such that $T(s)$ the spacelike unit tangent vector, $N_1(s)$ is timelike unit normal vector, and $N_2(s)$ the spacelike unit binormal vector. So scalar product and cross product of the vectors $\{T, N_1, N_2\}$ are given by

$$\begin{aligned} \langle T, T \rangle &= -\langle N_1, N_1 \rangle = \langle N_2, N_2 \rangle = 1, \\ \langle T, N_1 \rangle &= \langle T, N_2 \rangle = \langle N_1, N_2 \rangle = 0, \end{aligned} \quad (5)$$

$$\begin{aligned} T \wedge N_1 &= N_2, \\ N_1 \wedge N_2 &= T, \\ N_2 \wedge T &= -N_1. \end{aligned} \quad (6)$$

The Bishop frame $\{T, N_1, N_2\}$ is expressed as

$$\begin{aligned} T'(s) &= k_1 N_1(s) - k_2 N_2(s), \\ N_1'(s) &= k_1 T(s), \\ N_2'(s) &= k_2 T(s). \end{aligned} \quad (7)$$

One can show that

$$\kappa = \sqrt{|k_2^2 - k_1^2|}, \quad (8)$$

$$\tau = \frac{d\theta}{ds}, \quad \theta(s) = \operatorname{argtanh} \frac{k_2}{k_1} \quad (9)$$

so that k_1 and k_2 effectively correspond to a cartesian coordinate system for the polar coordinates κ, θ with $\theta = \int \tau(s) ds$ [11].

Remark 1. From the definition of the $\operatorname{argtanh}$ function we assume that $|k_2/k_1| < 1$.

The distribution parameter, the mean curvature, and the Gaussian curvature of the ruled surface $\phi(s, v)$ are given by

$$P_x = \frac{\det(T, X, D_T X)}{\langle D_T X, D_T X \rangle}, \quad (10)$$

$$H = \frac{1}{2} \left[\frac{Gl + En - 2Fm}{EG - F^2} \right], \quad (11)$$

where D is the Levi-Civita connection on $\mathbb{R}_1^3$.

Theorem 2. *A spacelike ruled surface is a developable surface if and only if the distribution parameter of the spacelike ruled surface is zero [4].*

The foot on the main ruling of the common perpendicular of two constructive rulings in the ruled surface is called a central point. The locus of the central point is called the striction curve. The parametrization of the striction curve on the ruled surface is given by

$$\bar{\alpha}(s) = \alpha(s) - \frac{\langle T, D_T X \rangle}{\langle D_T X, D_T X \rangle} X(s). \quad (12)$$

3. One Parameter Spatial Motion in $\mathbb{R}_1^3$

Let $\alpha : I \rightarrow \mathbb{R}_1^3$ be a spacelike curve and $\{T, N_1, N_2\}$ be its *Bishop frame* where T, N_1 , and N_2 are the tangent, principal normal, and binormal vectors of the curve α , respectively. T and N_2 are spacelike vectors and N_1 is a timelike vector.

The two coordinate systems $\{O; T, N_1, N_2\}$ and $\{O'; e_1, e_2, e_3\}$ are orthogonal coordinate systems in $\mathbb{R}_1^3$ which represent the moving space H and the fixed space H' , respectively.

Let X be a unit spacelike vector

$$\begin{aligned} X &\in \operatorname{Sp} \{T(s), N_1(s), N_2(s)\}, \\ X &= x_1 T(s) + x_2 N_1(s) + x_3 N_2(s), \end{aligned} \quad (13)$$

such that

$$\langle X, X \rangle = 1. \quad (14)$$

We can obtain the distribution parameter of the spacelike ruled surface generated by a straight line X of the moving space H . Differentiating (13) with respect to s , we get

$$\begin{aligned} D_T X &= x_1 T'(s) + x_2 N_1'(s) + x_3 N_2'(s), \\ x_1^2 - x_2^2 + x_3^2 &= 1. \end{aligned} \quad (15)$$

By using the Bishop frame in (15), we obtain

$$D_T X = (x_2 k_1 + x_3 k_2) T(s) + x_1 k_1 N_1(s) - x_1 k_2 N_2(s). \quad (16)$$

From (10) we get

$$\begin{aligned} P_x &= -\frac{x_1(x_2 k_2 + x_3 k_1)}{(x_2 k_1 + x_3 k_2)^2 + x_1^2(k_2^2 - k_1^2)}, \\ x_1^2 - x_2^2 + x_3^2 &= 1. \end{aligned} \quad (17)$$

Theorem 3. Let M be a spacelike ruled surface given by the parametrization (2). M is developable if and only if either the director vector X lies in the plane generated by $N_1(s)$ and $N_2(s)$ or the base curve α is a planar curve such that the curvatures of α , k_1 and k_2 satisfy

$$\frac{k_1}{k_2} = -\frac{x_2}{x_3}. \quad (18)$$

Proof. Let M be a ruled surface. By using (17) and Theorem 2,

$$x_1(x_2k_2 + x_3k_1) = 0 \quad (19)$$

is obtained. In that case, we have

$$x_1 = 0 \quad \text{or} \quad (x_2k_2 + x_3k_1) = 0. \quad (20)$$

Thus

$$\begin{aligned} X(s) &\in \text{Sp}\{N_1(s), N_2(s)\} \\ \text{or} \quad \frac{k_1}{k_2} &= -\frac{x_2}{x_3} = \text{constant}. \end{aligned} \quad (21)$$

From (9), we get

$$\tau = 0. \quad (22)$$

So, α is a planar curve. This completes the proof. $\square$

4. Special Cases

Let M be a spacelike ruled surface given by the parametrization (2), and, X be the director vector of the base curve α .

4.1. The Case $X = T$ (Spacelike). In this case, $x_1 = 1$, $x_2 = x_3 = 0$ thus from (17)

$$P_T = 0. \quad (23)$$

Hence the following theorem is hold.

Theorem 4. During the one-parameter spatial motion H/H' the spacelike ruled surface in the fixed space H' generated by the tangent line T of the curve $\alpha(s)$ in the moving space H is developable.

4.2. The Case $X = N_2$ (Spacelike). From Theorem 3, it is obvious that $P_{N_2} = 0$.

4.3. The Case $X \in \text{Sp}\{T(s), N_1(s)\}$. In this case, x_3 is zero. So, the director vector X is given by

$$X = x_1T + x_2N_1, \quad x_1^2 - x_2^2 = 1. \quad (24)$$

The distribution parameter of the ruled surface is given by

$$\begin{aligned} P_x &= -\frac{x_1x_2k_2}{x_2^2k_1^2 + x_1^2(k_2^2 - k_1^2)} \\ &= \pm \frac{x_2\sqrt{1+x_2^2}k_2}{x_2^2k_1^2 + (1+x_2^2)(k_2^2 - k_1^2)}. \end{aligned} \quad (25)$$

The ruled surface is developable if and only if $P_x = 0$. Thus

$$x_2 = 0 \quad \text{or} \quad k_2 = 0. \quad (26)$$

If $x_2 = 0$, this is case 4.1. If the second curvature k_2 is zero, then we can say that the base curve α is a planar curve.

4.4. The Case $X \in \text{Sp}\{T(s), N_2(s)\}$. In this case, x_2 is zero. So, the director vector X is given by

$$X = x_1T + x_3N_2, \quad x_1^2 + x_3^2 = 1. \quad (27)$$

From (17) the distribution parameter is obtained as

$$P_x = -\frac{x_1x_3k_1}{k_2^2 - x_1^2k_1^2} \quad (28)$$

$P_x = 0$ if and only if

$$x_1 = 0 \quad \text{or} \quad x_3 = 0. \quad (29)$$

If x_1 is zero, this is case 4.3. If x_3 is zero, this is The case 4.1.

From Theorem 3, M is a developable spacelike ruled surface.

4.5. The Case $X \in \text{Sp}\{N_1(s), N_2(s)\}$. From Theorem 3 it is obvious that the spacelike ruled surface is developable.

By using (11) we compute the mean curvatures of the spacelike ruled surfaces generated by spacelike vectors $T(s)$, $N_2(s)$, and X .

Proposition 5. Let M_T be a spacelike ruled surface generated by the tangent line T of the curve α . From (11) the mean curvature is obtained as follows:

$$H_T = \frac{1}{2} \frac{\epsilon(k_1k_2' - k_2k_1')}{v\sqrt{|k_1^2 - k_2^2|}}, \quad \epsilon = \pm 1. \quad (30)$$

Thus from (6) we have

$$H_T = -\frac{1}{2} \frac{\epsilon \tau}{v \kappa}. \quad (31)$$

Corollary 6. The surface M_T is minimal if and only if α is a planar curve.

Proof. Let M_T be minimal. In this case, from (31), we get

$$\tau = 0. \quad (32)$$

Conversely, let α be a planar curve. Then $\tau = 0$ implies that $H_T = 0$. This completes the proof. $\square$

Proposition 7. Let M_{N_2} be a spacelike ruled surface generated by the binormal line N_2 of the base curve α . From (11) the mean curvature is obtained as follows:

$$H_{N_2} = -\frac{\epsilon k_1}{2(1 + vk_2)}, \quad \epsilon = \pm 1. \quad (33)$$

So, the following result may be given.

Corollary 8. According to the Bishop frame, there is no minimal spacelike ruled surface generated by the binormal line N_2 in $\mathbb{R}_1^3$.

Proposition 9. Let M be a spacelike ruled surface which is given by the parametrization (2):

$$H_x = \frac{1}{2} \left[\frac{Gl + En - 2Fm}{EG - F^2} \right], \quad (34)$$

where

$$\begin{aligned} E &= \langle \phi_s, \phi_s \rangle = (1 + v(k_1x_2 + k_2x_3))^2 + v^2k_1^2(k_2^2 - k_1^2), \\ F &= \langle \phi_s, \phi_v \rangle = x_1, \\ G &= \langle \phi_v, \phi_v \rangle = 1, \end{aligned} \quad (35)$$

$$\begin{aligned} l &= \frac{1}{\|\phi_s \times \phi_v\|} \langle \phi_{ss}, \phi_s \times \phi_v \rangle \\ &= \frac{1}{\|\phi_s \times \phi_v\|} \times \begin{bmatrix} -(1 + v(x_2k_1 + x_3k_2))^2 (x_3k_1 + x_2k_2) \\ -(1 + v(x_2k_1 + x_3k_2)) vx_1 (x_3k'_1 + x_2k'_2) \\ + v^2x_1^3 (k_1k'_2 - k'_1k_2) \\ + v^2x_1 (x_2k_1 + x_3k_2) (x_2k'_1 + x_3k'_2) \\ + v^2x_1^2 (x_3k_1 + x_2k_2) (k_1^2 - k_2^2) \end{bmatrix} \end{aligned} \quad (36)$$

$$m = \frac{1}{\|\phi_s \times \phi_v\|} \langle \phi_{sv}, \phi_s \times \phi_v \rangle = \frac{-x_1 (k_1x_3 + k_2x_2)}{\|\phi_s \times \phi_v\|}, \quad (37)$$

$$n = \frac{1}{\|\phi_s \times \phi_v\|} \langle \phi_{vv}, \phi_s \times \phi_v \rangle = 0, \quad (38)$$

where

$$\begin{aligned} N &= \frac{\phi_s \times \phi_v}{\|\phi_s \times \phi_v\|} \\ &= \frac{1}{\|\phi_s \times \phi_v\|} \left\{ + \begin{bmatrix} [vx_1 (x_3k_1 + x_2k_2)] T \\ x_3 (1 + v(x_2k_1 + x_3k_2)) + vx_1^2k_2 \\ x_2 (1 + v(x_2k_1 + x_3k_2)) - vx_1^2k_1 \end{bmatrix} N_1 \right\} \end{aligned} \quad (39)$$

is a unit normal vector of the spacelike ruled surface M .

Proposition 10. Let M be a spacelike ruled surface given by the parametrization (2). If the base curve of M is also a striction curve, then the curvature functions k_1 and k_2 of the base curve α satisfy the following equation:

$$x_2k_1 + x_3k_2 = 0. \quad (40)$$

Proof. Let the base curve α be the striction curve. Thus, from (12),

$$\langle T, D_T X \rangle = 0. \quad (41)$$

Then we have

$$x_2k_1 + x_3k_2 = 0. \quad (42)$$

□

Hence the following result holds.

Corollary 11. Let M be a spacelike ruled surface given by the parametrization (2). If the base curve of M is also a striction curve, then α is a planar curve.

Proof. Let the base curve α be also a striction curve. Thus from (42)

$$x_2k_1 + x_3k_2 = 0. \quad (43)$$

Hence we get

$$\frac{k_1}{k_2} = -\frac{x_3}{x_2} = \text{constant}. \quad (44)$$

From (9), α is a planar curve. □

Proposition 12. Let M be a spacelike ruled surface given by the parametrization (2). If the base curve of M is also an asymptotic curve, then

$$(1 + v(x_2k_1 + x_3k_2))(x_2k_2 + x_3k_1) = 0. \quad (45)$$

Proof. We assume that the base curve of the surface M is the asymptotic curve. In that case,

$$\langle \alpha'', N \rangle = 0. \quad (46)$$

From (46), we have

$$(1 + v(x_2k_1 + x_3k_2))(x_2k_2 + x_3k_1) = 0. \quad (47)$$

□

Theorem 13. Let the base curve of the surface M be an asymptotic curve. If the base curve of M is also a striction curve, the spacelike ruled surface M is developable.

Proof. Let the base curve of the surface M be both an asymptotic curve and a striction curve. By using (42) and (45) we obtain

$$(x_2k_2 + x_3k_1) = 0. \quad (48)$$

From (17), the surface is developable. □

Proposition 14. Let M be a spacelike ruled surface given by the parametrization (2). We obtain the following results for the spacelike ruled surfaces.

(i) The s -parameter curve of M is also an asymptotic curve if and only if

$$\begin{bmatrix} -(1 + v(x_2k_1 + x_3k_2))^2 (x_3k_1 + x_2k_2) \\ -(1 + v(x_2k_1 + x_3k_2)) vx_1 (x_3k'_1 + x_2k'_2) \\ + v^2x_1^3 (k_1k'_2 - k'_1k_2) \\ + v^2x_1 (x_2k_1 + x_3k_2) (x_2k'_1 + x_3k'_2) \\ + v^2x_1^2 (x_3k_1 + x_2k_2) (k_1^2 - k_2^2) \end{bmatrix} = 0. \quad (49)$$

(ii) The v -parameter curve of M is also an asymptotic curve.

Proof. (i) If the s -parameter curve of M is also an asymptotic curve, then

$$\langle \phi_{ss}, N \rangle = 0. \quad (50)$$

From (36), we obtain (46).

(ii) If the v -parameter curve of M is also an asymptotic curve, then

$$\langle \phi_{vv}, N \rangle = 0. \quad (51)$$

v -parameter curve of M is an asymptotic curve.

□

Theorem 15. Let M be a developable spacelike ruled surface given by the parametrization (2). The s -parameter curve of M is also asymptotic curve if and only if M is a minimal surface.

Proof. Assume that s -parameter curve of the surface M an asymptotic curve. Then

$$l = \langle \phi_{ss}, N \rangle = 0, \quad (52)$$

where N is a unit normal vector field of the surface M . Since M is a developable ruled surface,

$$x_1(x_2k_1 + x_3k_2) = 0. \quad (53)$$

Thus from (34)

$$H_x = 0 \quad (54)$$

is obtained.

Conversely, let M be a minimal surface. From (14), we get

$$l - 2Fm = 0 \quad (55)$$

since M is a developable ruled surface, we obtain

$$l = 0. \quad (56)$$

This completes the proof.
