

## CURVATURE-PRESERVING TRANSFORMATIONS OF $K$ -CONTACT RIEMANNIAN MANIFOLDS

BY SHÔKICHI TANNO

Let  $M$  be a contact Riemannian manifold with a contact form  $\eta$ , the associated vector field  $\xi$ , (1, 1)-tensor field  $\phi$  and the associated Riemannian metric  $g$ . If  $\xi$  is a Killing vector field,  $M$  is said to be a  $K$ -contact Riemannian manifold. Further,  $M$  is said to be normal, if  $\phi$  satisfies the relation

$$(\nabla_X \phi)(Y) = g(X, Y)\xi - \eta(Y)X$$

for any vector fields  $X$  and  $Y$  on  $M$ , where  $\nabla$  is the covariant differentiation with respect to  $g$ .

Recently Okumura [2] got the following result:

(A) *In a normal contact Riemannian manifold, any curvature-preserving infinitesimal transformation is an infinitesimal isometry.*

On the other hand, Sakai [3] got the result:

(B) *Any affine transformation of a  $K$ -contact Riemannian manifold is an isometry.*

In this note, we prove the next theorem which covers the above (A) and (B):

**THEOREM.** *Let  $M, N$  be  $K$ -contact Riemannian manifolds, then any curvature-preserving transformation of  $M$  to  $N$  is an isometry.*

The proof of our theorem has similar aspect to that in [3]. In an  $m$ -dimensional  $K$ -contact Riemannian manifold we have

$$(1) \quad R_1(\xi, X) = (m-1)\eta(X),$$

$$(2) \quad R(X, \xi)\xi = -X + \eta(X)\xi$$

for any vector field  $X$  on  $M$ , where  $R_1$  and  $R$  denote the Ricci curvature and Riemannian curvature tensor [1].

### § Proof of the theorem.

We denote the corresponding tensors in  $N$  by “'”. Let  $\varphi$  be a curvature-preserving transformation of  $M$  to  $N$  and let  $x$  be an arbitrary point of  $M$ , and we put  $y = \varphi x$ . By  $X, Y, Z, W$  we denote vector fields on  $M$ . In any Riemannian manifold we have

---

Received July 7, 1966.

$$(3) \quad 'g_y('R(\varphi X, \varphi Y)\varphi Z, \varphi W) = -'g_y('R(\varphi X, \varphi Y)\varphi W, \varphi Z),$$

where  $\varphi$  stands for the differential of  $\varphi$ . As  $\varphi$  is curvature-preserving:  $\varphi(R(X, Y)Z) = 'R(\varphi X, \varphi Y)\varphi Z$ , we have

$$(4) \quad (\varphi^*g)_x(R(X, Y)Z, W) = -(\varphi^*g)_x(R(X, Y)W, Z).$$

If we put  $Y=Z=W=\xi$ , using (2) we have

$$(5) \quad (\varphi^*g)_x(X, \xi) = \sigma_x \eta_x(X),$$

where  $\sigma_x = (\varphi^*g)_x(\xi, \xi)$ . Next we put  $Y=Z=\xi$ , then

$$(6) \quad (\varphi^*g)_x(-X + \eta(X)\xi, W) = -(\varphi^*g)_x(R(X, \xi)W, \xi).$$

Replace  $X$  in (5) by  $W$  or  $R(X, \xi)W$ , then (6) turns to

$$-(\varphi^*g)_x(X, W) + \sigma_x \eta_x(X) \eta_x(W) = -\sigma_x \eta_x(R(X, \xi)W).$$

On the other hand, as

$$\eta_x(R(X, \xi)W) = g_x(R(X, \xi)W, \xi) = g_x(X, W) - \eta_x(X) \eta_x(W),$$

we have  $(\varphi^*g)_x(X, W) = \sigma_x g_x(X, W)$ . Namely  $\varphi$  is a conformal transformation. Next we prove  $\sigma_x = 1$ . Put  $X = \varphi\xi$  in (1), then we get

$$(7) \quad 'R_{1y}(' \xi, \varphi\xi) = (m-1)' \eta_y(\varphi\xi).$$

Since  $\varphi$  also leaves  $R_1$  invariant, we have

$$(8) \quad 'R_{1y}(' \xi, \varphi\xi) = R_{1x}(\varphi^{-1}' \xi, \xi) = (m-1)\eta_x(\varphi^{-1}' \xi).$$

From (7) and (8),  $' \eta_y(\varphi\xi) = \eta_x(\varphi^{-1}' \xi)$  follows. While we obtain

$$\begin{aligned} ' \eta_y(\varphi\xi) &= 'g_y(' \xi, \varphi\xi) = 'g_y(\varphi \cdot \varphi^{-1}' \xi, \varphi\xi) \\ &= (\varphi^*g)_x(\varphi^{-1}' \xi, \xi) = \sigma_x g_x(\varphi^{-1}' \xi, \xi) \\ &= \sigma_x \eta_x(\varphi^{-1}' \xi). \end{aligned}$$

Thus we get  $\sigma_x = 1$  or  $' \eta_y(\varphi\xi) = 0$ . Suppose that  $' \eta_y(\varphi\xi) = 0$ , then we have  $'R_y(\varphi\xi, ' \xi)' \xi = -(\varphi\xi)_y$  by (2) and so

$$\begin{aligned} \sigma_x &= 'g_y(\varphi\xi, \varphi\xi) \\ &= 'g_y('R(' \xi, \varphi\xi)' \xi, \varphi\xi) \\ &= 'g_y(\varphi \cdot R(\varphi^{-1}' \xi, \xi)\varphi^{-1}' \xi, \varphi\xi) \\ &= (\varphi^*g)_x(R(\varphi^{-1}' \xi, \xi)\varphi^{-1}' \xi, \xi) \\ &= -\sigma_x g_x(R(\varphi^{-1}' \xi, \xi)\xi, \varphi^{-1}' \xi) \\ &= \sigma_x g_x(\varphi^{-1}' \xi, \varphi^{-1}' \xi) = 1. \end{aligned}$$

Therefore  $\sigma$  is equal to 1 on  $M$ , this completes the proof.
