

The Geometry of Siegel Modular Varieties

Klaus Hulek and G. K. Sankaran

Contents

- Introduction
- I. Siegel modular varieties
 - I.1. Arithmetic quotients of the Siegel upper half plane
 - I.2. Compactifications of Siegel modular varieties
- II. Classification theory
 - II.1. The canonical divisor
 - II.2. The Kodaira dimension of $\mathcal{A}_g(n)$
 - II.3. Fundamental groups
- III. Abelian surfaces
 - III.1. The lifting method
 - III.2. General type results for moduli spaces of abelian surfaces
 - III.3. Left and right neighbours
- IV. Projective models
 - IV.1. The Segre cubic
 - IV.2. The Burkhardt quartic
 - IV.3. The Nieto quintic
- V. Non-principal polarizations
 - V.1. Type (1, 5) and the Horrocks-Mumford bundle
 - V.2. Type (1, 7)
 - V.3. Type (1, 11)
 - V.4. Other type (1, t) cases
- VI. Degenerations
 - VI.1. Local degenerations
 - VI.2. Global degenerations and compactification

Introduction

Siegel modular varieties are interesting because they arise as moduli spaces for abelian varieties with a polarization and a level structure,
