

# RANDOM MATRICES, LOG-GASES AND THE CALOGERO-SUTHERLAND MODEL

PETER J. FORRESTER

## CONTENTS

<b>0. Introduction</b>	<b>98</b>
<b>1. Classical Random Matrix Ensembles</b>	<b>103</b>
1.1. Calogero-Sutherland model and the log-gas analogy	
1.2. Gaussian random matrices as a model of a quantum Hamiltonian	
1.3. Calculation of the eigenvalue p.d.f.	
1.4. Random unitary matrices and Floquet operators	
1.5. Wishart matrices	
1.6. Eigenvalue p.d.f.'s of the Wishart matrices and analogy with Calogero-Sutherland model	
1.7. Relationship to Calogero-Sutherland model	
1.8. The Jacobi ensemble	
1.9. The static $n$ -particle distribution functions	
<b>2. Parameter-dependent random matrices</b>	<b>126</b>
2.1. Parameter-dependent Gaussian random matrices	
2.2. Parameter-dependent Wishart matrices	
2.3. Relationship to the Calogero-Sutherland model	
2.4. The Green function	
2.5. The dynamical correlations	
2.6. Sum rules and asymptotic behaviour	
<b>3. Polynomial eigenfunctions</b>	<b>140</b>
3.1. The case $\beta = 2$	
3.2. The Jack polynomials	
3.3. Generalized Jacobi polynomials	
3.4. An integration formula	
3.5. A trigonometric version of the integration formula	
3.6. Generalized Laguerre polynomials	
3.7. Generalized Hermite polynomials
