

Computational Aspects of Root Systems, Coxeter Groups, and Weyl Characters

John R. STEMBRIDGE

Table of Contents

0. Introduction	2
1. Reduced Words	2
2. Permutation Representations	4
3. The Conjugacy Problem	6
A. Characteristic polynomials	7
B. Permutation representations	7
C. Centrally symmetric orbits	8
D. Canonical representatives	9
4. Traversal	13
A. Finite automata	14
B. A low-technology solution	15
C. Implementation	17
D. Canonical descendants in Coxeter groups	18
5. The Weight System of a Weyl Character	19
A. Weyl characters	20
B. The partial ordering of integral weights	21
C. The complexity of a representation	22
D. Generating the weight system	22
6. Weight Multiplicities	26
A. Freudenthal's formula	26
B. The Moody-Patera refinement	27
C. The q -analogue of weight multiplicity	28
7. Tensor Product Multiplicities	29
A. The Brauer-Klimyk formula	29
B. Double specialization of Weyl characters	31
C. The support of a tensor product	33
D. The $qtensor$ algorithm	34
