member with respect to these unknown quantities and to equate the product of the coefficients of this development to 0 . This product will generally contain the other unknown quantities. Thus the resultant of the elimination of $z$ alone, as we have seen, is

$$
a b x y+c d x y^{\prime}+f g x^{\prime} y+h k x^{\prime} y^{\prime}=0
$$

and the resultant of the elimination of $y$ and $z$ is

$$
a b c d x+f g h k x^{\prime}=0 .
$$

These partial resultants can be obtained by means of the following practical rule: Form the constituents relating to the unknown quantities to be retained; give each of them, for a coefficient, the product of the coefficients of the constituents of the general development of which it is a factor, and equate the sum to 0 .
38. Theorem Concerning the Values of a Function:All the values which can be assumed by a function of any number of variables $f(x, y, z \ldots)$ are given by the formula

$$
a b c \ldots k+u(a+b+c+\ldots+k),
$$

in which $u$ is absolutely indeterminate, and $a, b, c \ldots, k$ are the coefficients of the development of $f$.

Demonstration.-It is sufficient to prove that in the equality

$$
f(x, y, z \ldots)=a b c \ldots k+u(a+b+c+\ldots+k)
$$

$u$ can assume all possible values, that is to say, that this equality, considered as an equation in terms of $u$, is indeterminate.

In the first place, for the sake of greater homogeneity, we may put the second member in the form

$$
u^{\prime} a b c \ldots k+u(a+b+c+\ldots+k)
$$

for

$$
a b c \ldots k=u a b c \ldots k+u^{\prime} a b c \ldots k
$$

and

$$
u a b c \ldots k<u(a+b+c+\ldots+k) .
$$

Reducing the second member to $\circ$ (assuming there are only three variables $x, y, z$ )
