

19 Hereditarily countable sets

HC is the set of all hereditarily countable sets. There is a close connection between the projective hierarchy above level 2 and a natural hierarchy on the subsets of HC. A formula of set theory is Δ_0 iff it is in the smallest family of formulas containing the atomic formulas of the form “ $x \in y$ ” or “ $x = y$ ”, and closed under conjunction, $\theta \wedge \phi$, negation, $\neg\theta$, and bounded quantification, $\forall x \in y$ or $\exists x \in y$. A formula θ of set theory is Σ_1 iff it is of the form $\exists u_1, \dots, u_n \psi$ where ψ is Δ_0 .

Theorem 19.1 *A set $A \subseteq \omega^\omega$ is Σ_2^1 iff there exists a Σ_1 formula $\theta(\cdot)$ of set theory such that*

$$A = \{x \in \omega^\omega : HC \models \theta(x)\}.$$

proof:

We note that Δ_0 formulas are absolute between transitive sets, i.e., if $\psi(\dots)$ is Δ_0 formula, M a transitive set and \bar{y} a finite sequence of elements of M , then $M \models \psi(\bar{y})$ iff $V \models \psi(\bar{y})$. Suppose that $\theta(\cdot)$ is a Σ_1 formula of set theory. Then for every $x \in \omega^\omega$ we have that $HC \models \theta(x)$ iff there exists a countable transitive set $M \in HC$ with $x \in M$ such that $M \models \theta(x)$. Hence, $HC \models \theta(x)$ iff there exists $E \subseteq \omega \times \omega$ and $\overset{\circ}{x} \in \omega$ such that letting $M = (\omega, E)$ then

1. E is extensional and well-founded,
2. $M \models \text{ZFC}^*$, (or just that ω exists)
3. $M \models \theta(\overset{\circ}{x})$,
4. for all $n, m \in \omega$ $x(n) = m$ iff $M \models \overset{\circ}{x}(\overset{\circ}{n}) = \overset{\circ}{m}$.

Therefore, $\{x \in \omega^\omega : HC \models \theta(x)\}$ is a Σ_2^1 set. On the other hand given a Σ_2^1 set A there exists a Π_1^1 formula $\theta(x, y)$ such that $A = \{x : \exists y \theta(x, y)\}$. But then by Mostowski absoluteness (Theorem 17.5) we have that $x \in A$ iff there exists a countable transitive set M with $x \in M$ and there exists $y \in M$ such that $M \models \text{ZFC}^*$ and $M \models \theta(x, y)$. But this is a Σ_1 formula for HC.

■

The theorem says that $\Sigma_2^1 = \Sigma_1^{HC}$. Similarly, $\Sigma_{n+1}^1 = \Sigma_n^{HC}$. Let us illustrate this with an example construction.

Theorem 19.2 *If $V=L$, then there exists a Δ_2^1 Luzin set $X \subseteq \omega^\omega$.*

proof:

Let $\{T_\alpha : \alpha < \omega_1\}$ (ordered by $<_c$) be all subtrees T of $\omega^{<\omega}$ whose branches $[T]$ are a closed nowhere dense subset of ω^ω . Define x_α to be the least constructed ($<_c$) element of ω^ω which is not in

$$\bigcup_{\beta < \alpha} [T_\beta] \cup \{x_\beta : \beta < \alpha\}.$$
