

We shall now say that  $P$  is reducible to  $Q$  if

$$P(\vec{\alpha}, \vec{x}) \leftrightarrow Q(\lambda y G_1(y, \vec{\alpha}, \vec{x}), \dots, \lambda y G_m(y, \vec{\alpha}, \vec{x}), F_1(\vec{\alpha}, \vec{x}), \dots, F_k(\vec{\alpha}, \vec{x}))$$

where  $G_1, \dots, G_m, F_1, \dots, F_k$  are total and recursive.

19.3. PROPOSITION. If  $P$  is  $\Pi_n^1$  and  $Q$  is reducible to  $P$ , then  $P$  is  $\Pi_n^1$ ; and similarly with  $\Sigma_n^1$  or  $\Delta_n^1$  in place of  $\Pi_n^1$ .  $\square$

The analogue of the table in §12 is the following table.

| $P, Q$       | $\neg P$     | $P \vee Q$   | $P \& Q$     | $\forall \alpha P$ | $\exists \alpha P$ | $QxP$        |
|--------------|--------------|--------------|--------------|--------------------|--------------------|--------------|
| $\Pi_n^1$    | $\Sigma_n^1$ | $\Pi_n^1$    | $\Pi_n^1$    | $\Pi_n^1$          | $\Sigma_{n+1}^1$   | $\Pi_n^1$    |
| $\Sigma_n^1$ | $\Pi_n^1$    | $\Sigma_n^1$ | $\Sigma_n^1$ | $\Pi_{n+1}^1$      | $\Sigma_n^1$       | $\Sigma_n^1$ |
| $\Delta_n^1$ | $\Delta_n^1$ | $\Delta_n^1$ | $\Delta_n^1$ | $\Pi_n^1$          | $\Sigma_n^1$       | $\Delta_n^1$ |

It is proved and used in the same way as the earlier table.

The classification of analytical relations into the  $\Pi_n^1$  and  $\Sigma_n^1$  relations is called the analytical hierarchy.

19.4. ANALYTICAL ENUMERATION THEOREM. For every  $n$ ,  $m$ , and  $k$ , there is a  $\Pi_n^1(m, k+1)$ -ary function which enumerates the class of  $\Pi_n^1(m, k)$ -ary relations; and similarly with  $\Sigma_n^1$  for  $\Pi_n^1$ .

*Proof.* Suppose, for example, we want to enumerate the  $\Pi_2^1(1, 1)$ -ary relations. Every such relation  $R$  is of the form  $\forall \alpha \exists \beta P$  where  $P$  is  $\Pi_1^0$  by the remarks after 19.1. Thus if  $Q$  is  $\Pi_1^0$  and enumerates the  $\Pi_1^0(3, 1)$ -ary relations, then  $\forall \alpha \exists \beta Q(\alpha, \beta, \gamma, x, e)$  is the desired enumerating function.  $\square$

19.5. ANALYTICAL HIERARCHY THEOREM. For each  $n$ , there is a  $\Pi_n^1$  set which is not  $\Sigma_n^1$ , hence not  $\Pi_k^1$  or  $\Sigma_k^1$  for any  $k < n$ . The same holds with  $\Pi_n^1$  and  $\Sigma_n^1$  interchanged.

*Proof.* As in the arithmetical case.  $\square$

## 20. The Projective Hierarchy

The results of the last section can be relativized to a class  $\Phi$  of total functions of number variables. A particularly interesting case is that in which  $\Phi$
