7. ISOLATED SINGULARITIES OF R(z)

In the last section we have considered the Laurent expansion of the resolvent operator $\mathbb{R}(z)$ in an annulus contained in the resolvent set $\rho(T)$ of $T \in BL(X)$. We now specialize to the case when the inner circle of such an annulus degenerates to a point λ ; i.e., when a punched disk $\{z \in \mathbb{C} : 0 < |z-\lambda| < \delta\}$ lies in $\rho(T)$. Let Γ be any curve in $\rho(T)$ such that $\sigma(T) \cap \operatorname{Int} \Gamma \subset \{\lambda\}$. Since the operators $\mathbb{P}_{\Gamma}(T)$, $\mathbb{S}_{\Gamma}(T,\lambda)$ and $\mathbb{D}_{\Gamma}(T,\lambda)$ do not depend on Γ , we denote them simply by \mathbb{P}_{λ} , \mathbb{S}_{λ} and \mathbb{D}_{λ} , respectively. The operators \mathbb{S}_{λ} and \mathbb{D}_{λ} have special features. By the first resolvent identity (5.5), we have

$$\begin{split} \mathbf{S}_{\lambda} &= \frac{1}{2\pi \mathrm{i}} \int_{\Gamma} \frac{\mathbf{R}(\mathbf{w})}{\mathbf{w} - \lambda} \, \mathrm{d}\mathbf{w} \\ &= \lim_{Z \to \lambda} \frac{1}{2\pi \mathrm{i}} \int_{\Gamma} \frac{\mathbf{R}(\mathbf{w})}{\mathbf{w} - z} \, \mathrm{d}\mathbf{w} \\ &= \lim_{Z \to \lambda} \frac{1}{2\pi \mathrm{i}} \int_{\Gamma} \frac{\mathbf{R}(z) + \mathbf{R}(\mathbf{w}) - \mathbf{R}(z)}{\mathbf{w} - z} \, \mathrm{d}\mathbf{w} \\ &= \lim_{Z \to \lambda} \frac{1}{2\pi \mathrm{i}} \left[\mathbf{R}(z) \int_{\Gamma} \frac{\mathrm{d}\mathbf{w}}{\mathbf{w} - z} + \int_{\Gamma} \frac{(\mathbf{w} - z)\mathbf{R}(z)\mathbf{R}(\mathbf{w})}{\mathbf{w} - z} \, \mathrm{d}\mathbf{w} \right] \\ &= \lim_{Z \to \lambda} \left[\mathbf{R}(z) + \mathbf{R}(z)(-\mathbf{P}) \right] \, . \end{split}$$

Thus, we see that

(7.1)
$$S_{\lambda} = \lim_{z \to \lambda} \mathbb{R}(z)(I-P) .$$

Next, it follows by Proposition 6.4 and (5.1) that

$$(7.2) \sigma(\mathbb{S}_{\lambda}) \subset \{0\} \cup \{1/(\mu - \lambda) : \mu \in \sigma(\mathbb{T}) \ , \ \mu \neq \lambda\}$$

where the inclusion is proper if and only if $\lambda \notin \sigma(T)$. Hence

(7.3)
$$r_{\sigma}(S_{\lambda}) = \frac{1}{\operatorname{dist}(\lambda, \sigma(T) \setminus \{\lambda\})}$$

Again, Proposition 6.4 implies that

(7.4)
$$\sigma(D_{\lambda}) = \{0\} \text{ and } r_{\sigma}(D_{\lambda}) = 0$$
.
