# Chow rings of versal complete flag varieties 

By Nobuaki Yagita

(Received June 27, 2018)

#### Abstract

In this paper, we try to compute Chow rings of versal complete flag varieties corresponding to simple Lie groups, by using generalized Rost motives. As applications, we give new proofs of Totaro's results for the torsion indexes of simple Lie groups except for spin groups.

## 1. Introduction.

Let $G$ and $T$ be a connected compact Lie group and its maximal torus. Let $G_{k}$ and $T_{k}$ be a split reductive group and split maximal torus over a field $k$ with $\operatorname{ch}(k)=0$, corresponding to Lie groups $G$ and $T$. Let $B_{k}$ be a Borel subgroup containing $T_{k}$.

Moreover we take $k$ such that there is a $G_{k}$-torsor $\mathbb{G}_{k}$ which is isomorphic to a versal $G_{k}$-torsor (for the definition of a versal $G_{k}$-torsor, see Section 4 below or see [Ga-Me-Se], [Ka1], [Me-Ne-Za], [To1]). Then $X=\mathbb{G}_{k} / B_{k}$ is thought as the most twisted complete flag variety. (We say that such $X$ is a generically twisted or a versal flag variety [Ka1], [ $\mathrm{Me}-\mathrm{Ne}-\mathrm{Za}]$.)

Let us fix a prime number $p$. In this paper, we study the $p$-localized Chow ring $C H^{*}(X)_{(p)}=C H^{*}(X) \otimes \mathbb{Z}_{(p)}$ and write it simply $C H^{*}(X)$, through this paper. We also use the notation $C H^{*}(X) / p$ for $C H^{*}(X) \otimes \mathbb{Z} / p$. By Petrov-Semenov-Zainoulline $([\mathbf{P e - S e - Z a}],[\mathbf{S e}],[\mathbf{S e - Z h}])$, it is known that the $p$-localized motive $M(X)_{(p)}$ of $X$ is decomposed as

$$
M(X)_{(p)}=M\left(\mathbb{G}_{k} / B_{k}\right)_{(p)} \cong \oplus_{i} R\left(\mathbb{G}_{k}\right) \otimes \mathbb{T}^{\otimes s_{i}}
$$

where $\mathbb{T}$ is the Tate motive and $R\left(\mathbb{G}_{k}\right)$ is some motive called generalized Rost motive. (It is the original Rost motive ( $[\mathbf{R o 1}],[\mathbf{R o 2}],[\mathbf{V o 2}],[\mathbf{V o 3}])$ when $G$ is of type ( $I$ ) as explained below [ $\mathbf{P e - S e - Z a ] ) . ~}$

Let $B B_{k}$ be the classifying space for $B_{k}$-bundles. (For an algebraic group $H_{k}$, we can approximate the classifying space $B H_{k}$ by a colimit of algebraic varieties, and $C H^{*}\left(B H_{k}\right)$ is defined as a limit of Chow rings of these varieties, for details see [ $\mathbf{P e}-\mathbf{S e}],[\mathbf{T o 3}]$. .) Since $\mathbb{G} \rightarrow X=\mathbb{G} / B_{k}$ is a $B_{k}$-bundle, we have the characteristic (classifying) map $X \rightarrow B B_{k}$. Hence we have maps

$$
C H^{*}\left(B B_{k}\right) \xrightarrow{\text { char. }} \xrightarrow{\text { map }} C H^{*}(X) \xrightarrow{\text { split surj. }} C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) .
$$

Remark. In this paper, a map $A \rightarrow B$ (resp. $A \cong B$ ) for rings $A, B$ means a ring map (resp. a ring isomorphism). However $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right)$ does not have a canonical ring

[^0]structure. Hence a map $A \rightarrow C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p\left(\right.$ resp. $\left.A \cong C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p\right)$ means only a (graded) additive map (resp. additive isomorphism) even if $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p$ has some ring structure. For example, the above first map is a ring map but the second is not a ring map.

From Karpenko [Ka1], and Merkurjev-Neshitov-Zainoulline [Me-Ne-Za], we know that the first map is also surjective when $\mathbb{G}_{k}$ is a versal $G_{k}$-torsor. We study what elements in $C H^{*}\left(B B_{k}\right) \cong C H^{*}\left(B T_{k}\right)$ (Subsection 2.4, page 21 in [To3]) generate $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right)$.

For example, Petrov (Theorem 1 in $[\mathbf{P e}]$ ) computed $C H^{*}(Y)$ for the versal maximal orthogonal Grassmannian $Y$ corresponding to $G=S O(2 \ell+1), \ell>0$. It is torsion free and is isomorphic to $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right)$ (see Theorem 7.13 below). Hence the restriction map $C H^{*}(X) \rightarrow C H^{*}\left(G_{k} / B_{k}\right)$ is injective. Thus we know the ring structure of $C H^{*}(X)$ from that of $C H^{*}\left(G_{k} / B_{k}\right)([\mathbf{T o d} \mathbf{- W a}],[\mathbf{V i}])$. These Petrov's results can be very simply written, when we consider the mod (2) Chow theories.

Theorem 1.1. Let $(G, p)=(S O(2 \ell+1), 2)$ and $X=\mathbb{G}_{k} / B_{k}$ be a versal flag variety. Then there are isomorphisms

$$
\begin{aligned}
& C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2 \cong \mathbb{Z} / 2\left[c_{1}, \ldots, c_{\ell}\right] /\left(c_{1}^{2}, \ldots, c_{\ell}^{2}\right)=\Lambda\left(c_{1}, \ldots, c_{\ell}\right) \\
& C H^{*}(X) / 2 \cong S(t) /\left(2, c_{1}^{2}, \ldots, c_{\ell}^{2}\right)
\end{aligned}
$$

where $c_{i}=\sigma_{i}\left(t_{1}, \ldots, t_{\ell}\right)$ is the $i$-th elementary symmetric function in

$$
S(t)=C H^{*}\left(B B_{k}\right) \cong H^{*}(B T) \cong \mathbb{Z}\left[t_{1}, \ldots, t_{\ell}\right]
$$

Remark. We have an isomorphism $C H^{*}(X) / 2 \cong H^{*}(S p(\ell) / T ; \mathbb{Z} / 2)$ for the symplectic group $S p(\ell)$ (see Corollary 7.9).

We give a new proof of the above theorem, which can work for other groups such that Chow rings $C H^{*}(X)$ have $p$-torsion elements. The additive structures in the following theorem are known $([\mathbf{K a - M e}],[\mathbf{M e - S u}],[\mathbf{Y a} 4])$. However, the ring structure of $C H^{*}(X) / p$ was unknown except for $(G, p)=\left(G_{2}, 2\right)([\mathbf{Y a} 3])$.

Theorem 1.2. Let $G$ be of type $(I)$ and $\operatorname{rank}(G)=\ell$. Then $2 p-2 \leq \ell$, and we can take $b_{i} \in S(t)=C H^{*}\left(B B_{k}\right)$ for $1 \leq i \leq \ell$ such that there are isomorphisms

$$
\begin{gathered}
C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p \cong \mathbb{Z} / p\left\{b_{1}, \ldots, b_{2 p-2}\right\}, \\
C H^{*}(X) / p \cong S(t) /\left(p, b_{i} b_{j}, b_{k} \mid 0 \leq i, j \leq 2 p-2<k \leq \ell\right)
\end{gathered}
$$

where $\mathbb{Z} / p\{a, b, \ldots\}$ is the $\mathbb{Z} / p$-free module generated by $a, b, \ldots$. Moreover the ideal of torsion elements in $C H^{*}(X)$ is generated by $b_{1}, b_{3}, \ldots, b_{2 p-3}$.

Here $b_{i} \in H^{*}(B T)$ are transgression images in the spectral sequence induced from the fibering $G \rightarrow G / T \rightarrow B T$. These $b_{i}$ are explicitly known ([Na], [Tod2], [Tod-Wa]), for example, when $(G, p)=\left(G_{2}, 2\right)$, we can take $b_{1}=t_{1}^{2}+t_{1} t_{2}+t_{2}^{2}$ and $b_{2}=t_{2}^{3}$ in $H^{*}(B T) \cong \mathbb{Z}\left[t_{1}, t_{2}\right]$ with $\left|t_{i}\right|=2$ (Theorem 5.3 in [Ya3]).

To explain the transgression and type ( $I$ ) groups, we recall how to compute $H^{*}(G / T)$ in algebraic topology. By Borel ([Bo], $[\mathbf{M i}-\mathbf{T o d}])$, its $\bmod (p)$ cohomology is (for $p$ odd)

$$
H^{*}(G ; \mathbb{Z} / p) \cong P(y) / p \otimes \Lambda\left(x_{1}, \ldots, x_{\ell}\right), \quad\left|x_{i}\right|=o d d
$$

where $P(y)$ is a truncated polynomial ring generated by even dimensional elements $y_{i}$, and $\Lambda\left(x_{1}, \ldots, x_{\ell}\right)$ is the $\mathbb{Z} / p$ exterior algebra generated by $x_{1}, \ldots, x_{\ell}$. When $p=2$, we consider the graded ring $\operatorname{gr} H^{*}(G ; \mathbb{Z} / 2)$ which is isomorphic to the right hand side ring above.

When $G$ is simply connected and $P(y)$ is generated by just one generator, we say that $G$ is of type $(I)$. Except for $\left(E_{7}, p=2\right)$ and ( $E_{8}, p=2,3$ ), all exceptional simple Lie groups are of type ( $I$ ) (see [Mi-Tod], $[\mathbf{P e - S e - Z a ] ) . ~ T h e ~ g r o u p s ~} \operatorname{Spin}(n), 7 \leq n \leq 10$ are also of type $(I)$. Note that in these cases, it is known $\operatorname{rank}(G)=\ell \geq 2 p-2$.

We consider the fibering $([\mathbf{M i}-\mathbf{N i}],[\mathbf{N a}],[\mathbf{T o d} 2]) G \xrightarrow{\pi} G / T \xrightarrow{i} B T$ and the induced spectral sequence

$$
E_{2}^{*, *^{\prime}}=H^{*}\left(B T ; H^{*^{\prime}}(G ; \mathbb{Z} / p)\right) \Longrightarrow H^{*}(G / T ; \mathbb{Z} / p)
$$

Here we can write $H^{*}(B T) \cong S(t)=\mathbb{Z}\left[t_{1}, \ldots, t_{\ell}\right]$ with $\left|t_{i}\right|=2$.
It is well known that $y_{i} \in P(y)$ are permanent cycles (i.e., $y_{i}$ exist as nonzero elements in $E_{\infty}^{0, *}$ ) and that there is a regular sequence $\left(\bar{b}_{1}, \ldots, \bar{b}_{\ell}\right)$ in $H^{*}(B T) /(p)$ such that $d_{\left|x_{i}\right|+1}\left(x_{i}\right)=\bar{b}_{i}([\mathbf{M i} \mathbf{- N i}],[\mathbf{T o d} \mathbf{2}])$. The element $\bar{b}_{i}$ is called the transgression image of $x_{i}$. We know that $G / T$ is a manifold such that $H^{*}(G / T)=H^{\text {even }}(G / T)$ and $H^{*}(G / T)$ is torsion free. We also see that there is a filtration in $H^{*}(G / T)_{(p)}$ such that

$$
g r H^{*}(G / T)_{(p)} \cong P(y) \otimes S(t) /\left(b_{1}, \ldots, b_{\ell}\right)
$$

where $b_{i} \in S(t)$ with $b_{i}=\bar{b}_{i} \bmod (p)$. Here we note that we can take $b_{i}=0 \in$ $H^{*}(G / T) / p$, since $b_{i}=0 \in E_{\infty}^{*, 0}$ in the spectral sequence.

The transgression images $b_{i}$ in Theorem 1.2 are just $b_{i}$ above. When $(G, p)=$ $(S O(2 \ell+1), 2)$ we can take $b_{i}=c_{i}$. Hence $b_{1}, \ldots, b_{\ell}$ generate the kernel $I(p)$ of the map

$$
H^{*}(B T) / p \cong S(t) / p \rightarrow S(t) /\left(p, b_{1}, \ldots, b_{\ell}\right) \subset H^{*}(G / T) / p
$$

(it is also isomorphic to the kernel of $\left.C H^{*}\left(B B_{k}\right) / p \rightarrow C H^{*}\left(G_{k} / B_{k}\right) / p\right)$.
By giving the filtration on $S(t)$ by $b_{i}$, we can write

$$
g r S(t) / p \cong A \otimes S(t) /\left(b_{1}, \ldots, b_{\ell}\right) \quad \text { for } \quad A=\mathbb{Z} / p\left[b_{1}, \ldots, b_{\ell}\right]
$$

In particular, we have maps $A \xrightarrow{i_{A}} C H^{*}(X) / p \rightarrow C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p$. We easily see that $i_{A}(A) \supset C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p$. In particular the above composition map is surjective. Suppose that there are $f_{1}(b), \ldots, f_{s}(b) \in A$ such that $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p \cong A /\left(f_{1}(b), \ldots, f_{s}(b)\right)$. Moreover if $f_{i}(b)=0$ also in $C H^{*}(X) / p$, then we have the isomorphism

$$
C H^{*}(X) / p \cong S(t) /\left(f_{1}(b), \ldots, f_{s}(b)\right)
$$

The first isomorphism of Theorem 1.1 (resp. Theorem 1.2 when $\ell=2 p-2$ ) can be rewritten

$$
C H^{*}(X) / 2 \cong S(t) /\left(I(2)^{[2]}\right), \quad\left(\text { resp. } C H^{*}(X) / p \cong S(t) /\left(I(p)^{2}\right)\right)
$$

where $I(2){ }^{[2]}=\operatorname{Ideal}\left(x^{2} \mid x \in I(2)\right)$.
For other simple groups $G$, it seems that only few facts were known for $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p$ when $*>3$. Hence we write down the fundamental facts here.

Theorem 1.3. Let $(G, p)=(S O(2 \ell+1), 2),\left(G^{\prime}, p\right)=(\operatorname{Spin}(2 \ell+1), 2)$, and $\pi$ : $G^{\prime} \rightarrow G$ be the natural projection. Let $c_{i}^{\prime}=\pi^{*}\left(c_{i}\right)$. Then $\pi^{*}$ induces maps such that their composition map is surjective

$$
C H^{*}\left(R\left(\mathbb{G}_{k}\right) /\left(2, c_{1}\right) \cong \Lambda\left(c_{2}, \ldots, c_{\ell}\right) \xrightarrow{\pi^{*}} C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2 \rightarrow \mathbb{Z} / 2\left\{1, c_{2}^{\prime}, \ldots, c_{\bar{\ell}}^{\prime}\right\}\right.
$$

where $\bar{\ell}=\ell-1$ if $\ell=2^{j}$ for some $j>0$, otherwise $\bar{\ell}=\ell$. Moreover $c_{2^{k}}^{\prime}-2 c_{1}^{2^{k}}, k>0$ are torsion elements in $C H^{*}(X)$.

The right hand side module in the above map seems some fundamental parts in $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2$. For example, the groups $\operatorname{Spin}(7), \operatorname{Spin}(9)$ are of type (I) and $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2 \cong \mathbb{Z} / 2\left\{1, c_{2}^{\prime}, c_{3}^{\prime}\right\}$. However, the group $\operatorname{Spin}(11)$ is not of type ( $I$ ).

Lemma 1.4. For $\left(G^{\prime}, p\right)=(\operatorname{Spin}(11), 2)$, we have the surjection

$$
C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2 \rightarrow \mathbb{Z} / 2\left\{1, c_{2}^{\prime}, c_{3}^{\prime}, c_{4}^{\prime}, c_{5}^{\prime}, c_{2}^{\prime} c_{4}^{\prime}, c_{1}^{8}\right\}
$$

Remark. Quite recently, Karpenko [Ka2] proved that the above surjection is an isomorphism.

Theorem 1.5. Let $(G, p)=\left(E_{7}, 2\right),\left(E_{8}, 2\right)$ or $\left(E_{8}, 3\right)$ so that $\ell=7$ for $E_{7}$ and $\ell=8$ for $E_{8}$. Then we have the surjective map

$$
C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p \rightarrow \mathbb{Z} / p\left\{1, b_{1}, \ldots, b_{\ell}\right\}
$$

Moreover for $(G, p)=\left(E_{7}, 2\right),\left(E_{8}, 3\right)$, we have

$$
\left(C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) /(\text { Tor })\right) \otimes \mathbb{Z} / p \cong \mathbb{Z} / p\left\{1, b_{2}, \ldots, b_{\ell}, b_{2} b_{\ell}\right\}
$$

where Tor is the submodule of $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right)$ generated by torsion elements.
Note that the above $b_{i} \neq 0$ is not a trivial fact. Indeed for groups of type (I), we see $b_{i}=0$ when $2 p-2<i \leq \ell$.

To see the above elements are nonzero, we mainly use the torsion index $t(G)_{(p)}$. For $\operatorname{dim}_{\mathbb{R}}(G / T)=2 d$, the torsion index is defined as

$$
t(G)=\left|H^{2 d}(G / T ; \mathbb{Z}) / i^{*} H^{2 d}(B T ; \mathbb{Z})\right| \quad \text { for } \quad i: G / T \rightarrow B T
$$

Let $n\left(\mathbb{G}_{k}\right)$ be the greatest common divisor of the degrees of all finite field extension $k^{\prime}$ of $k$ such that $\mathbb{G}_{k}$ becomes trivial over $k^{\prime}$. Then by Grothendieck [ $\mathbf{G r}$ ], it is known that $n\left(\mathbb{G}_{k}\right)$ divides $t(G)$. Moreover, when $\mathbb{G}_{k}$ is a versal $G_{k}$-torsor, we have $n\left(\mathbb{G}_{k}\right)=t(G)$ ([Ga-Me-Se], [To2]). Totaro determined ([To1], [To2]) torsion indexes for all simply connected compact Lie groups $G$. For example, $t\left(E_{8}\right)=2^{6} 3^{2} 5$.

For all exceptional simple groups $G$, we give another proofs of Totaro's results by
using arguments of the above transgression images $b_{i}$ (e.g., Lemma 11.11). However we can not compute $t(G)$ for $G=\operatorname{Spin}(2 \ell+1)$ by our arguments.

We also consider a field $K$ of an extension of $k$ such that $\left.R\left(\mathbb{G}_{k}\right)\right|_{K}$ is a direct sum of the original Rost motives, and study the restriction map $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p \rightarrow$ $C H^{*}\left(\left.R\left(\mathbb{G}_{k}\right)\right|_{K}\right) / p$ (Theorems 7.12, 11.13, Propositions 10.8, 12.8). The first two theorems relate to recent results by Smirnov-Vishik $[\mathbf{S m - V i}]$ and Semenov $[\mathbf{S e}]$ respectively.

The plan of this paper is the following. In Section 2, Section 3, we recall and prepare the topological arguments for $H^{*}(G / T)$ and $B P^{*}(G / T)$. In Section 4, we recall the decomposition of the motive of a versal flag variety. In Section 5, we recall the torsion index briefly. In Section 6, we study $U(m), S p(m)$ and $P U(p)$ for each $p$. In Section 7, Section 8 we study $S O(m)$ and $\operatorname{Spin}(m)$ for $p=2$. In Section 9, we study the cases that $G$ is of type (I). In Section 10, Section 11, Section 12, we study the cases $(G, p)=\left(E_{8}, 3\right),\left(E_{8}, 2\right)$ and $\left(E_{7}, 2\right)$ respectively.

The author thanks the referees for their kind comments and suggestions.

## 2. Lie groups $G$ and the flag manifolds $G / T$.

Let $G$ be a connected compact Lie group. By Borel ([Bo], $[\mathbf{M i} \mathbf{- T o d}])$, its $\bmod (p)$ cohomology is (for $p$ odd)

$$
\begin{gather*}
H^{*}(G ; \mathbb{Z} / p) \cong P(y) / p \otimes \Lambda\left(x_{1}, \ldots, x_{\ell}\right), \quad \ell=\operatorname{rank}(G)  \tag{2.1}\\
\quad \text { with } \quad P(y)=\mathbb{Z}_{(p)}\left[y_{1}, \ldots, y_{k}\right] /\left(y_{1}^{p_{1}^{r_{1}}}, \ldots, y_{k}^{p_{k}^{r_{k}}}\right)
\end{gather*}
$$

where the degree $\left|y_{i}\right|$ of $y_{i}$ is even and $\left|x_{j}\right|$ is odd. When $p=2$, a graded ring $\operatorname{gr} H^{*}(G ; \mathbb{Z} / 2)$ is isomorphic to the right hand side ring, e.g., $x_{j}^{2}=y_{i_{j}}$ for some $y_{i_{j}}$. In this paper, $H^{*}(G ; \mathbb{Z} / 2)$ means this $\operatorname{gr} H^{*}(G ; \mathbb{Z} / 2)$ so that (2.1) is satisfied also for $p=2$.

Let $T$ be the maximal torus of $G$ and $B T$ be the classifying space of $T$. We consider the fibering $([\mathbf{M i} \mathbf{- N i}],[\mathbf{T o d} \mathbf{2}]) G \xrightarrow{\pi} G / T \xrightarrow{i} B T$ and the induced spectral sequence

$$
E_{2}^{*, *^{\prime}}=H^{*}\left(B T ; H^{*^{\prime}}(G ; \mathbb{Z} / p)\right) \Longrightarrow H^{*}(G / T ; \mathbb{Z} / p)
$$

The cohomology of the classifying space of the torus is given by $H^{*}(B T) \cong S(t)=$ $\mathbb{Z}\left[t_{1}, \ldots, t_{\ell}\right]$ with $\left|t_{i}\right|=2$, where $t_{i}=\operatorname{pr}_{\mathrm{i}}^{*}\left(\mathrm{c}_{1}\right)$ is the 1 -st Chern class induced from

$$
T=S^{1} \times \cdots \times S^{1} \xrightarrow{\mathrm{pr}_{\mathrm{i}}} S^{1} \subset U(1)
$$

for the $i$-th projection $\operatorname{pr}_{\mathrm{i}}$. Note that $\ell=\operatorname{rank}(\mathrm{G})$ is also the number of the odd degree generators $x_{i}$ in $H^{*}(G ; \mathbb{Z} / p)$.

It is well known that $y_{i}$ are permanent cycles (i.e., $d_{r}\left(y_{i}\right)=0$ for $r \geq 2$ ) and that there is a regular sequence $\left([\mathbf{M i} \mathbf{- N i} \mathbf{i},[\mathbf{T o d} 2])\left(\bar{b}_{1}, \ldots, \bar{b}_{\ell}\right)\right.$ in $H^{*}(B T) /(p)$ such that $d_{\left|x_{i}\right|+1}\left(x_{i}\right)=\bar{b}_{i}$. Thus we get

$$
E_{\infty}^{*, *^{\prime}} \cong g r H^{*}(G / T ; \mathbb{Z} / p) \cong P(y) / p \otimes S(t) /\left(\bar{b}_{1}, \ldots, \bar{b}_{\ell}\right)
$$

Moreover we know that $G / T$ is a manifold such that $H^{*}(G / T)$ is torsion free, and
hence

$$
\begin{equation*}
H^{*}(G / T)_{(p)} \cong \mathbb{Z}_{(p)}\left[y_{1}, \ldots, y_{k}\right] \otimes S(t) /\left(f_{1}, \ldots, f_{k}, b_{1}, \ldots, b_{\ell}\right) \tag{2.2}
\end{equation*}
$$

where $b_{i}=\bar{b}_{i} \bmod (p)$ and $f_{i}=y_{i}^{p^{r_{i}}} \bmod \left(t_{1}, \ldots, t_{\ell}\right)$.
Let $B P^{*}(-)$ be the Brown-Peterson theory with the coefficients ring $B P^{*} \cong$ $\mathbb{Z}_{(p)}\left[v_{1}, v_{2}, \ldots\right],\left|v_{i}\right|=-2\left(p^{i}-1\right)([\mathbf{H a}],[\mathbf{R a}])$. Since $H^{*}(G / T)$ is torsion free, the AtiyahHirzebruch spectral sequence collapses. Hence we also know

$$
\begin{equation*}
B P^{*}(G / T) \cong B P^{*}\left[y_{1}, \ldots, y_{k}\right] \otimes S(t) /\left(\tilde{f}_{1}, \ldots, \tilde{f}_{k}, \tilde{b}_{1}, \ldots, \tilde{b}_{\ell}\right) \tag{2.3}
\end{equation*}
$$

where $\tilde{b}_{i}=b_{i} \bmod \left(B P^{<0}\right)$ and $\tilde{f}_{i}=f_{i} \bmod \left(B P^{<0}\right)$.
Let $G_{k}$ be the split reductive algebraic group corresponding to $G$, and $T_{k}$ be the split maximal torus corresponding to $T$. Let $B_{k}$ be the Borel subgroup with $T_{k} \subset B_{k}$. Note that $G_{k} / B_{k}$ is cellular, and $C H^{*}\left(G_{k} / T_{k}\right) \cong C H^{*}\left(G_{k} / B_{k}\right)$, since the fiber of the $\operatorname{map} G_{k} / T_{k} \rightarrow G_{k} / B_{k}$ is a unipotent group. Hence we have

$$
C H^{*}\left(G_{k} / B_{k}\right) \cong H^{*}(G / T)_{(p)}, \quad C H^{*}\left(B B_{k}\right) \cong H^{*}(B T)_{(p)}
$$

Let $\Omega^{*}(-)$ be the $B P$-version of the algebraic cobordism ([Le-Mo1], [Le-Mo2], [Ya2], [Ya4])

$$
\Omega^{*}(X)=M G L^{2 *, *}(X)_{(p)} \otimes_{M U_{(p)}^{*}} B P^{*}, \quad \Omega^{*}(X) \otimes_{B P^{*}} \mathbb{Z}_{(p)} \cong C H^{*}(X)
$$

where $M G L^{*, *^{\prime}}(X)$ is the algebraic cobordism theory defined by Voevodsky with $M G L^{2 *, *}(p t.) \cong M U^{*}$ the complex cobordism ring. There is a natural (realization) map $\Omega^{*}(X) \rightarrow B P^{*}(X(\mathbb{C}))$. In particular, we have $\Omega^{*}\left(G_{k} / B_{k}\right) \cong B P^{*}(G / T)$. Let $I_{n}=\left(p, v_{1}, \ldots, v_{n-1}\right)$ and $I_{\infty}=\left(p, v_{1}, \ldots\right)$ be the (prime invariant) ideals in $B P^{*}$. We also note

$$
\Omega^{*}\left(G_{k} / B_{k}\right) / I_{\infty} \cong B P^{*}(G / T) / I_{\infty} \cong H^{*}(G / T) / p
$$

## 3. The Brown-Peterson theory $B P^{*}(G / T)$.

Recall that $k(n)^{*}(X)$ is the connected Morava $K$-theory with the coefficients ring $k(n)^{*} \cong \mathbb{Z} / p\left[v_{n}\right]$ and $\rho: k(n)^{*}(X) \rightarrow H^{*}(X ; \mathbb{Z} / p)$ is the natural (Thom) map. Recall that there is an exact sequence (Sullivan exact sequence [Ra], [Ya2])

$$
\cdots \rightarrow k(n)^{*+2\left(p^{n}-1\right)}(X) \xrightarrow{v_{n}} k(n)^{*}(X) \xrightarrow{\rho} H^{*}(X ; \mathbb{Z} / p) \xrightarrow{\delta} \cdots
$$

such that $\rho \cdot \delta(x)=Q_{n}(x)$. Here the Milnor $Q_{i}$ operation

$$
Q_{i}: H^{*}(X ; \mathbb{Z} / p) \rightarrow H^{*+2 p^{i}-1}(X ; \mathbb{Z} / p)
$$

is defined by $Q_{0}=\beta$ and $Q_{i+1}=P^{p^{i}} Q_{i}-Q_{i} P^{p^{i}}$ for the Bockstein operation $\beta$ and the reduced power operation $P^{j}$.

We consider the Serre spectral sequence

$$
E_{2}^{*, *^{\prime}} \cong H^{*}\left(B ; H^{*^{\prime}}(F ; \mathbb{Z} / p)\right) \Longrightarrow H^{*}(E ; \mathbb{Z} / p)
$$

induced from the fibering $F \xrightarrow{i} E \xrightarrow{\pi} B$ with $H^{*}(B) \cong H^{\text {even }}(B)$.
LEMMA 3.1 (Lemma 4.3 in [Ya1]). In the spectral sequence $E_{r}^{*, *^{\prime}}$ above, suppose that there is $x \in H^{*}(F ; \mathbb{Z} / p)$ such that

$$
(*) \quad y=Q_{n}(x) \neq 0 \quad \text { and } \quad b=d_{|x|+1}(x) \neq 0 \in E_{|x|+1}^{*, 0} .
$$

Moreover suppose that $E_{|x|+1}^{0,|x|} \cong \mathbb{Z} / p\{x\} \cong \mathbb{Z} / p$. Then there are $y^{\prime} \in k(n)^{*}(E)$ and $b^{\prime} \in k(n)^{*}(B)$ such that $i^{*}\left(y^{\prime}\right)=y, \rho\left(b^{\prime}\right)=b$ and that in $k(n)^{*}(E)$,

$$
(* *) \quad v_{n} y^{\prime}=\lambda \pi^{*}\left(b^{\prime}\right) \quad \text { for } \quad \lambda \neq 0 \in \mathbb{Z} / p
$$

Conversely if $(* *)$ holds in $k(n)^{*}(E)$ for $y=i^{*}\left(y^{\prime}\right) \neq 0$ and $b=\rho\left(b^{\prime}\right) \neq 0$, then there is $x \in H^{*}(F ; \mathbb{Z} / p)$ such that $(*)$ holds.

Proof. Let $B^{\prime}=B T^{|b|-1}$ be the $|b|-1$ dimensional skeleton of $B T$, and $E^{\prime}=$ $\pi^{-1}\left(B^{\prime}\right)$. Consider the Serre spectral sequence

$$
E_{2}^{*, *^{\prime}} \cong H^{*}\left(B^{\prime} ; H^{*^{\prime}}(F ; \mathbb{Z} / p)\right) \Longrightarrow H^{*}\left(E^{\prime} ; \mathbb{Z} / p\right)
$$

Since $d_{r}(x)=b=0 \in H^{*}\left(B^{\prime} ; \mathbb{Z} / p\right)$, there is $x^{\prime} \in H^{*}\left(E^{\prime} ; \mathbb{Z} / p\right)$ such that $i^{*}\left(x^{\prime}\right)=x$. Let $Q_{n}\left(x^{\prime}\right)=y^{\prime}$ so that $i^{*} y^{\prime}=y$. Then $y^{\prime}$ can be identified as $\delta x^{\prime} \in k(n)^{*}\left(E^{\prime}\right)$ from $Q_{n}=\rho \delta$. By the Sullivan exact sequence, we see $v_{n} y^{\prime}=0$ in $k(n)^{*}\left(E^{\prime}\right)$.

On the other hand, let $B^{\prime \prime}=B^{|b|-1} \cup e_{b}$ and $E^{\prime \prime}=\pi^{-1} B^{\prime \prime}$ where $e_{b}$ is the normal cell representing $b$. Then $d_{r} x=b \neq 0 \in H^{*}\left(B^{\prime \prime} ; \mathbb{Z} / p\right)$. By the supposition in this lemma, there does not exist $x^{\prime \prime} \in H^{*}\left(E^{\prime \prime} ; \mathbb{Z} / p\right)$ such that $i^{*}\left(Q_{n} x^{\prime \prime}\right)=y$, that is, for each $y^{\prime \prime} \in H^{*}\left(E^{\prime \prime} ; \mathbb{Z} / p\right)$ with $\pi^{*} y^{\prime \prime}=y$, we see $v_{n} y^{\prime \prime} \neq 0 \in k(n)^{*}\left(E^{\prime \prime}\right)$.

For $j: E^{\prime} \subset E^{\prime \prime}$, we can take an element $y^{\prime \prime}$ with $j^{*}\left(y^{\prime \prime}\right)=y^{\prime}$ by the following reason. Consider the long exact sequence

$$
\cdots \rightarrow H^{*}\left(E^{\prime \prime} ; \mathbb{Z} / p\right) \xrightarrow{j^{*}} H^{*}\left(E^{\prime} ; \mathbb{Z} / p\right) \xrightarrow{\partial} H^{*}\left(E^{\prime \prime} / E^{\prime} ; \mathbb{Z} / p\right) \rightarrow \cdots
$$

Since $x^{\prime}$ does not exist in $H^{*}\left(E^{\prime \prime} ; \mathbb{Z} / p\right)$, we see $\partial\left(x^{\prime}\right) \neq 0$. Hence $\partial\left(x^{\prime}\right)=b$ from $H^{|b|}\left(E^{\prime \prime} / E^{\prime} ; \mathbb{Z} / p\right) \cong \mathbb{Z} / p\{b\}$. So we see

$$
\partial\left(y^{\prime}\right)=\partial\left(Q_{n}\left(x^{\prime}\right)\right)=Q_{n}(b)=0
$$

since $b \in H^{*}(B)$. Hence $y^{\prime} \in \operatorname{Im}\left(j^{*}\right)$.
Hence $v_{n} y^{\prime}=v_{n} j^{*}\left(y^{\prime \prime}\right)=0 \in k(n)^{*}\left(E^{\prime}\right)$ but $v_{n} y^{\prime \prime} \neq 0 \in k(n)^{*}\left(E^{\prime \prime}\right)$. By dimensional reason, $v_{n} y^{\prime \prime}=\lambda b$ for $\lambda \neq 0 \in \mathbb{Z} / p$.

Conversely, suppose that $v_{n} y^{\prime}=\pi^{*}\left(b^{\prime}\right) \neq 0$ in $k(n)^{*}(E)$. Then $v_{n} y^{\prime}=0$ in $k(n)^{*}\left(E^{\prime}\right)$ and there is $\tilde{x} \in H^{*}\left(E^{\prime} ; \mathbb{Z} / p\right)$ with $Q_{n} \tilde{x}=y^{\prime}$. Then for $i^{*}\left(y^{\prime}\right)=y$ and $i^{*}(\tilde{x})=x$, we see $Q_{n}(x)=y$. But $\tilde{x}$ does not exist in $H^{*}\left(E^{\prime \prime} ; \mathbb{Z} / p\right)$. Hence $d_{|x|+1}(x)=\lambda b$ for $\lambda \neq 0 \in \mathbb{Z} / p$, by dimensional reason.

Remark (Remark 4.8 in [Ya1]). The above lemma also holds when $k(0)^{*}(X)=$ $H^{*}\left(X ; \mathbb{Z}_{(p)}\right)$ and $v_{0}=p$. This fact is well known (Lemma 2.1 in [Tod2]).

Corollary 3.2. In the spectral sequence converging to $H^{*}(G / T ; \mathbb{Z} / p)$, let $b \neq 0$ be the transgression image of $x$, i.e., $d_{|x|+1}(x)=b$. Then we have the relation in $B P^{*}(G / T) / I_{\infty}^{2}$ such that

$$
b=\sum_{i=0} v_{i} y(i)
$$

where $y(i) \in H^{*}(G / T ; \mathbb{Z} / p)$ with $\pi^{*} y(i)=Q_{i} x$.
Proof. Since $b=0 \in H^{*}(G / T ; \mathbb{Z} / p)$, in $B P^{*}(G / T) / I_{\infty}^{2}$, we can write

$$
b=p y(0)+v_{1} y(1)+v_{2} y(2)+\cdots .
$$

If $Q_{i}(x)=y(i)^{\prime} \neq 0$, then $b=v_{i} y(i)^{\prime}$ and take $y(i)=y(i)^{\prime}$. If $Q_{i}(x)=0$, then $b=0$ $\bmod \left(v_{i}^{2}\right)$ in $k(i)^{*}(G / T)$. Otherwise $b=v_{i} y(i)^{\prime}$ with $y(i)^{\prime} \neq 0$ in $H^{*}(G / T ; \mathbb{Z} / p)$ by Sullivan exact sequence. Then $Q_{i}(x)=y(i)^{\prime}$ from the converse of the preceding lemma. This is a contradiction. So let $y(i)=0$ when $Q_{i}(x)=0$.

Let $G$ be a simply connected Lie group such that $H^{*}(G)$ has $p$-torsion. Then it is known ([Mi-Tod]) that $H^{*}(G)$ has just (not higher) $p$-torsion in $H^{*}(G)_{(p)}$. It is also known that there is $m \geq 1$ with

$$
\text { (*) } P^{p^{i}}\left(y_{i}\right)=y_{i+1} \quad \text { for } \quad 1 \leq i \leq m-1, \text { and } P^{p^{m}}\left(y_{m}\right)=0 .
$$

(Here suffix $i$ is changed adequately from that defined in the preceding section (2.1). Note $m=1$ for type (I) groups.) Moreover $\left|x_{1}\right|=3$ and $P^{1}\left(x_{1}\right)=-x_{2}$, and $\beta\left(x_{2}\right)=y_{1}$. We can also take $x_{i+1}$ such that

$$
(* *) \quad Q_{i}\left(x_{1}\right)=y_{i}, \quad Q_{0}\left(x_{i+1}\right)=y_{i} .
$$

Therefore from the preceding corollary, in $B P^{*}(G / T) / I_{\infty}^{2}$, we have

$$
b_{1}=v_{1} y(1)+\cdots+v_{m} y(m)
$$

with $\pi^{*}(y(i))=y_{i}$. We will study the above equation in more details.
Here we recall the Quillen (Landweber-Novikov) operation ([Ha], $[\mathbf{R a}])$. For a sequence $\alpha=\left(a_{1}, a_{2}, \ldots\right), a_{i} \geq 0$ with $|\alpha|=\sum_{i} 2\left(p^{i}-1\right) a_{i}$, we have the Quillen operation $r_{\alpha}: B P^{*}(X) \rightarrow B P^{*+|\alpha|}(X)$ such that

$$
\text { (1) } \rho\left(r_{\alpha}(x)\right)=\chi P^{\alpha}(\rho(x)) \text { for } \rho: B P^{*}(X) \rightarrow H^{*}(X ; \mathbb{Z} / p) \text {, }
$$

where $\chi$ is the anti-automorphism in the Steenrod algebra,
(2) $\quad r_{\alpha}(x y)=\sum_{\alpha=\alpha^{\prime}+\alpha^{\prime \prime}} r_{\alpha^{\prime}}(x) r_{\alpha^{\prime \prime}}(y) \quad$ Cartan formula,
(3) $\quad r_{\alpha}\left(v_{n}\right)=\left\{\begin{array}{lll}v_{i} & \bmod \left(I_{\infty}^{2}\right) \\ 0 & \bmod \left(I_{\infty}^{2}\right)\end{array} \quad\right.$ if $\alpha=p^{i} \Delta_{n-i}=\left(0, \ldots, 0, p^{n-i}, 0, \ldots, 0\right)$.

We also note that $\Omega^{*}(X)$ has the same operation $r_{\alpha}$ satisfying (2), (3) and (1) for $\rho: \Omega^{*}(X) \rightarrow C H^{*}(X) / p$ and the reduced power operation $P^{\alpha}$ on $C H^{*}(X) / p=$ $H^{2 *, *}(X ; \mathbb{Z} / p)$ defined by Voevodsky.

Lemma 3.3. If $|\alpha|<2\left(p^{i}-p^{i-1}\right)$, then $r_{\alpha}$ acts on $B P^{*}(X) /\left(I_{\infty}^{2}, v_{i}, \ldots\right)$.
Proof. Here note $\left|v_{i-1}\right|-\left|v_{i}\right|=2\left(p^{i}-p^{i-1}\right)$. In this case, we have $r_{\alpha}\left(v_{s}\right) \in I_{\infty}^{2}$ for all $s \geq i$.

Let $h^{*}(-)$ be a $\bmod (p)$ cohomology theory (e.g., $\left.H^{*}(-; \mathbb{Z} / p), k(n)^{*}(-)\right)$. The product $G \times G \rightarrow G$ induces the map

$$
\mu: G \times G / T \rightarrow G / T
$$

Here note $h^{*}(G \times G / T) \cong h^{*}(G) \otimes_{h^{*}} h^{*}(G / T)$, since $h^{*}(G / T)$ is $h^{*}$-free. For $x \in h^{*}(G / T)$, we say that $x$ is primitive $([\mathbf{M i}-\mathbf{N i}],[\mathbf{M i}-\mathbf{T o d}])$ if

$$
\mu^{*}(x)=\pi^{*}(x) \otimes 1+1 \otimes x \quad \text { where } \pi: G \rightarrow G / T
$$

It is immediate that if $x$ is primitive, then so is $r_{\alpha}(x)$. Of course $b \in B P^{*}(B T)$ are primitive but $b y_{i}$ are not, in general. We can take $y_{1}$ as a primitive element (adding elements if necessary) in $B P^{*}(G / T)$.

Lemma 3.4. Let $G$ be a simply connected Lie group satisfying (*). Let $y_{1}$ be a primitive element in $B P^{*}(G / T)$, and define $y_{i+1}=r_{p^{i} \Delta_{1}}\left(y_{i}\right)$. Then we have

$$
v_{1} y_{1}+v_{2} y_{2}+\cdots+v_{m} y_{m}=b_{1} \quad \bmod \left(I_{\infty}^{2}\right)
$$

Proof. Note that $v_{n} y(n)=b_{1} \in k(n)^{*}(G / T)$ is primitive. We prove $y_{n}=y(n)$ $\bmod \left(I_{\infty}^{2}\right)$. Let us write

$$
y(n)=y_{n}+\sum y t
$$

with $y \in P(y), t \in S(t),|t| \geq 2$.
We will prove $t=0$. Consider the Atiyah-Hirzebruch spectral sequence

$$
E_{2}^{*, *^{\prime}} \cong H^{*}\left(G ; k(n)^{*^{\prime}}\right) \Longrightarrow k(n)^{*}(G)
$$

The first non-zero differential is $d_{2 p^{n}-1}(x)=v_{n} Q_{n}(x)$. Since $|y| \leq\left|y_{n}\right|-2=2 p^{n}$, we see that $y$ is $v_{n}$-torsion free in $k(n)^{*}(G)$. This means if $t \neq 0$, then

$$
v_{n} y \otimes t \neq 0
$$

in $k(n)^{*}(G) \otimes_{k^{*}(n)} k(n)^{*}(G / T)$. Therefore $t=0$ since $y_{n}$ and $v_{n} y(n)$ are primitive.

Applying $r_{\Delta_{1}}$ to the equation in Lemma 3.4, we have
Lemma 3.5. In $B P^{*}(G / T) /\left(I_{\infty}^{2}\right)$, we have

$$
p y_{1}+v_{1} P^{1}\left(y_{1}\right)+v_{2} P^{1}\left(y_{2}\right)+\cdots+v_{m} P^{1}\left(y_{m}\right)=P^{1}\left(b_{1}\right)=b_{2} .
$$

## 4. Versal flag varieties.

Recall that $\mathbb{G}_{k}$ is a nontrivial $G_{k}$-torsor. We can construct a twisted form of $G_{k} / B_{k}$ by

$$
\left(\mathbb{G}_{k} \times G_{k} / B_{k}\right) / G_{k} \cong \mathbb{G}_{k} / B_{k} .
$$

We will study the twisted flag variety $X=\mathbb{G}_{k} / B_{k}$.
Let $P \supset T$ be a parabolic subgroup of $G$. Petrov, Semenov and Zainoulline developed the theory of decompositions of motives $M\left(\mathbb{G}_{k} / P_{k}\right)$. They develop the theory of generically split varieties. We say that $L$ is a splitting field of a variety of $X$ if $M\left(\left.X\right|_{L}\right)$ is isomorphic to a direct sum of twisted Tate motives $\mathbb{T}^{\otimes i}$ and the restriction $\operatorname{map} i_{L}: M(X) \rightarrow M\left(\left.X\right|_{L}\right)$ is isomorphic after tensoring $\mathbb{Q}$. A smooth scheme $X$ is said to be generically split over $k$ if its function field $L=k(X)$ is a splitting field. Note that (the complete flag) $X=\mathbb{G}_{k} / B_{k}$ is always generically split, i.e., $\left.X\right|_{L}$ is cellular.

Theorem 4.1 (Theorem 3.7 in $\left[\mathbf{P e - S e - Z a ] ) . ~ L e t ~} Q_{k} \subset P_{k}\right.$ be parabolic subgroups of $G_{k}$ which are generically split over $k$. Then there is a decomposition of motive $M\left(\mathbb{G} / Q_{k}\right) \cong M\left(\mathbb{G}_{k} / P_{k}\right) \otimes H^{*}(P / Q)$.

By extending the arguments by Vishik [Vi] for quadrics to that for flag varieties, Petrov, Semenov and Zainoulline define the $J$-invariant of $\mathbb{G}_{k}$. Recall the expression in Section 2

$$
(*) \quad H^{*}(G ; \mathbb{Z} / p) \cong \mathbb{Z} / p\left[y_{1}, \ldots, y_{s}\right] /\left(y_{1}^{p^{r_{1}}}, \ldots, y_{s}^{p_{s}^{r_{s}}}\right) \otimes \Lambda\left(x_{1}, \ldots, x_{\ell}\right) .
$$

Roughly speaking (for the accurate definition, see [Pe-Se-Za]), the $J$-invariant is defined as $J_{p}\left(\mathbb{G}_{k}\right)=\left(j_{1}, \ldots, j_{s}\right)$ if $j_{i}$ is the minimal integer such that

$$
y_{i}^{p_{i}^{j_{i}}} \in \operatorname{Im}\left(\operatorname{res}_{\mathrm{CH}}\right) \quad \bmod \left(y_{1}, \ldots, y_{i-1}, t_{1}, \ldots, t_{\ell}\right)
$$

for $\operatorname{res}_{\mathrm{CH}}: C H^{*}\left(\mathbb{G}_{k} / B_{k}\right) \rightarrow C H^{*}\left(G_{k} / B_{k}\right)$. Here we take $\left|y_{1}\right| \leq\left|y_{2}\right| \leq \cdots$ in $(*)$. Hence $0 \leq j_{i} \leq r_{i}$ and $J_{p}\left(\mathbb{G}_{k}\right)=(0, \ldots, 0)$ if and only if $\mathbb{G}_{k}$ splits by an extension of the index coprime to $p$. One of the main results in $[\mathrm{Pe}-\mathrm{Se}-\mathrm{Za}]$ is

Theorem 4.2 (Theorem 5.13 in $\left[\mathbf{P e - S e - Z a ] ~ a n d ~ T h e o r e m ~} 4.3\right.$ in $[\mathbf{S e - Z h}]$ ). Let $\mathbb{G}_{k}$ be a $G_{k}$-torsor over $k, X=\mathbb{G}_{k} / B_{k}$ and $J_{p}\left(\mathbb{G}_{k}\right)=\left(j_{1}, \ldots, j_{s}\right)$. Then there is a $p$-localized motive $R\left(\mathbb{G}_{k}\right)$ such that

$$
M(X)_{(p)} \cong \oplus_{u} R\left(\mathbb{G}_{k}\right) \otimes \mathbb{T}^{\otimes u}
$$

Here $\mathbb{T}^{\otimes u}$ are Tate motives with $C H^{*}\left(\oplus_{u} \mathbb{T}^{\otimes u}\right) / p \cong P^{\prime}(y) \otimes S(t) /(b)$ where

$$
\begin{gathered}
P^{\prime}(y)=\mathbb{Z} / p\left[y_{1}^{p^{j_{1}}}, \ldots, y_{s}^{p_{s}}\right] /\left(y_{1}^{p^{r_{1}}}, \ldots, y_{s}^{p^{r_{s}}}\right) \subset P(y) / p, \\
S(t) /(b)=S(t) /\left(b_{1}, \ldots, b_{\ell}\right)
\end{gathered}
$$

The $\bmod (p)$ Chow group of $\bar{R}\left(\mathbb{G}_{k}\right)=R\left(\mathbb{G}_{k}\right) \otimes \bar{k}$ is given by

$$
C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}\right)\right) / p \cong \mathbb{Z} / p\left[y_{1}, \ldots, y_{s}\right] /\left(y_{1}^{p_{1}}, \ldots, y_{s}^{p_{s}}\right) .
$$

Hence we have $C H^{*}(\bar{X}) / p \cong C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}\right)\right) \otimes P^{\prime}(y) \otimes S(t) /(b)$ and

$$
C H^{*}(X) / p \cong C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) \otimes P^{\prime}(y) \otimes S(t) /(b)
$$

Let $P_{k}$ be a special parabolic subgroup of $G_{k}$ (i.e., any extension is split, e.g., $B_{k}$ ). Let us consider an embedding of $G_{k}$ into the general linear group $G L_{N}$ for some $N$. This makes $G L_{N}$ a $G_{k}$-torsor over the quotient variety $S=G L_{N} / G_{k}$. We define $F$ to be the function field $k(S)$ and define the versal $G_{k}$-torsor $E$ to be the $G_{k}$-torsor over $F$ given by the generic fiber of $G L_{N} \rightarrow S$. (For details, see [Ga-Me-Se], [Ka1], [Me-Ne-Za], [To2].)

The corresponding flag variety $E / P_{k}$ is called generically twisted or versal flag variety, which is considered as the most complicated twisted flag variety (for given $G_{k}, P_{k}$ ). It is known that the Chow ring $C H^{*}\left(E / P_{k}\right)$ is not dependent to the choice of generic $G_{k}$-torsors $E$ (Remark 2.3 in [Ka1]).

Karpenko [Ka1] proved the following theorem for $C H^{*}(X)$. Merkurjev-NeshitovZainoulline $[\mathrm{Me}-\mathrm{Ne}-\mathrm{Za}$ ] also stated this theorem.

Theorem 4.3 (Karpenko Lemma 2.1 in [Ka1], [Me-Ne-Za]). Let $h^{*}(X)$ be an oriented cohomology theory (e.g., $\left.C H^{*}(X), \Omega^{*}(X)\right)$. Let $P_{k}$ be a parabolic subgroup of $G_{k}$ and $\mathbb{G}_{k} / P_{k}$ be a versal flag variety. Then the natural map $h^{*}\left(B P_{k}\right) \rightarrow h^{*}\left(\mathbb{G}_{k} / P_{k}\right)$ is surjective.

Corollary 4.4. The Chow ring $C H^{*}\left(\mathbb{G}_{k} / B_{k}\right)$ is generated by elements $t_{i}$ in $S(t)$. In particular, for each $x \in C H^{*}\left(G_{k} / B_{k}\right)$, the element $p^{s} x$ is represented by elements in $S(t)$ for a sufficient large $s$.

Proof. For some extension $F / k$ of order $a p^{s}$ with $a$ coprime to $p$ (i.e., $(a, p)=1$ ), the $G_{k}$-torsor $\mathbb{G}_{k}$ splits. Hence $p^{s} y^{i} \in \operatorname{Im}\left(\operatorname{res}_{\mathrm{CH}}: C H^{*}\left(\mathbb{G}_{k} / B_{k}\right) \rightarrow C H^{*}\left(G_{k} / B_{k}\right)\right)$, which is written by elements in $S(t)$ by the above Karpenko theorem.

Corollary 4.5. If $\mathbb{G}_{k}$ is versal, then $J\left(\mathbb{G}_{k}\right)=\left(r_{1}, \ldots, r_{s}\right)$, i.e., $r_{i}=j_{i}$.
Proof. If $j_{i}<r_{i}$, then $0 \neq y_{i}^{p^{j_{i}}} \in \operatorname{res}\left(C H^{*}(X) \rightarrow C H^{*}\left(G_{k} / B_{k}\right)\right)$, which is in the image from $S(t)$ by the preceding theorem. This induces a contradiction since
$C H^{*}\left(G_{k} / T_{k} ; \mathbb{Z} / p\right) \cong P(y) / p \otimes S(t) /(b)$ and $0 \neq y_{i}^{p^{j_{i}}} \in P(y) / p$.
Here we recall the (original) Rost motive $R_{a}$ (we write it by $R_{n}$ ) defined from a nonzero pure symbol $a$ in the $\bmod (p)$ Milnor $K$-theory $K_{n+1}^{M}(k) / p$. When $J\left(\mathbb{G}_{k}\right)=(1)$ (and $G$ is simply connected), we know $R\left(\mathbb{G}_{k}\right) \cong R_{2}$ from [Pe-Se-Za]. We write $\bar{R}_{n}=$ $R_{n} \otimes \bar{k}$. The Rost motive $R_{n}$ is defined as a non-split motive but split over a field of degree $a p$ with $(a, p)=1$, and for $|y|=2 b_{n}=2\left(p^{n}-1\right) /(p-1)$

$$
C H^{*}\left(\bar{R}_{n}\right) \cong \mathbb{Z}[y] /\left(y^{p}\right), \quad \Omega^{*}\left(\bar{R}_{n}\right) \cong B P^{*}[y] /\left(y^{p}\right)
$$

Theorem 4.6 ([ $\mathbf{M e}-\mathbf{S u}],[\mathbf{V i - Y a}],[\mathbf{Y a 4}]) . \quad$ Let $R_{n}$ be the (original) Rost motive defined by Rost and Voevodsky ([Ro1], $[\mathbf{R o 2}],[\mathbf{V o 2}],[\mathbf{V o 3}])$. Then the restriction res $_{\Omega}$ : $\Omega^{*}\left(R_{n}\right) \rightarrow \Omega^{*}\left(\bar{R}_{n}\right)$ is injective. Recall $I_{n}=\left(p, \ldots, v_{n-1}\right) \subset B P^{*}$. The restriction image $\operatorname{Im}\left(\operatorname{res}_{\Omega}\right)$ is isomorphic to

$$
\begin{aligned}
& B P^{*}\{1\} \oplus I_{n} \otimes \mathbb{Z}_{(p)}[y]^{+} /\left(y^{p}\right) \\
& \quad \cong B P^{*}\left\{1, v_{j} y^{i} \mid 0 \leq j \leq n-1,1 \leq i \leq p-1\right\} \subset B P^{*}[y] /\left(y^{p}\right)
\end{aligned}
$$

Hence writing $v_{j} y^{i}=c_{j}\left(y^{i}\right),\left|c_{j}\left(y^{i}\right)\right|=2 i b_{n}-2\left(p^{j}-1\right)$, we have

$$
C H^{*}\left(R_{n}\right) / p \cong \mathbb{Z} / p\left\{1, c_{j}\left(y^{i}\right) \mid 0 \leq j \leq n-1,1 \leq i \leq p-1\right\}
$$

Example. In particular, we have isomorphisms

$$
\begin{gathered}
C H^{*}\left(R_{1}\right) / p \cong \mathbb{Z} / p\left\{1, c_{0}(y), \ldots, c_{0}\left(y^{p-1}\right)\right\} \\
C H^{*}\left(R_{2}\right) / p \cong \mathbb{Z} / p\left\{1, c_{0}(y), c_{1}(y), \ldots, c_{0}\left(y^{p-1}\right), c_{1}\left(y^{p-1}\right)\right\} .
\end{gathered}
$$

## 5. Torsion index.

Let $\operatorname{dim}_{\mathbb{R}}(G / T)=2 d$. Then the torsion index is defined as

$$
t(G)=\left|H^{2 d}(G / T ; \mathbb{Z}) / i^{*} H^{2 d}(B T ; \mathbb{Z})\right|
$$

for $i: G / T \rightarrow B T$. Let $n\left(\mathbb{G}_{k}\right)$ be the greatest common divisor of the degrees of all finite field extension $k^{\prime}$ of $k$ such that $\mathbb{G}_{k}$ becomes trivial over $k^{\prime}$. Then by Grothendieck [ $\mathbf{G r}$ ], it is known that $n\left(\mathbb{G}_{k}\right)$ divides $t(G)$. Moreover, there is a $G_{k}$-torsor $\mathbb{G}_{F}$ over some extension field $F$ of $k$ such that $n\left(\mathbb{G}_{F}\right)=t(G)$ (in fact, this holds for each versal $G_{k^{-}}$ torsor $[\mathbf{K a 1}]$, $[\mathbf{M e}-\mathbf{N e - Z a}],[\mathbf{T o 2}])$. Note that $t\left(G_{1} \times G_{2}\right)=t\left(G_{1}\right) \cdot t\left(G_{2}\right)$. It is well known that if $H^{*}(G)$ has a $p$-torsion, then $p$ divides the torsion index $t(G)$. Torsion indexes for simply connected compact Lie groups are completely determined by Totaro [To1], [To2]. For example, $t\left(E_{8}\right)=2^{6} 3^{2} 5$.

Hereafter in this paper, we assume that $\mathbb{G}_{k}$ is a versal $G_{k}$-torsor and $X=\mathbb{G}_{k} / B_{k}$ is the versal flag variety. Recall that

$$
g r H^{*}(G / T ; \mathbb{Z} / p) \cong P(y) / p \otimes S(t) /(b)
$$

where $S(t) /(b)=S(t) /\left(b_{1}, \ldots, b_{\ell}\right), P(y) / p \cong \mathbb{Z} / p\left[y_{1}, \ldots, y_{s}\right] /\left(y_{1}^{p_{1}}, \ldots, y_{s}^{p_{s}^{r_{s}}}\right)$. Recall Corollary 4.5, and then we see $J\left(\mathbb{G}_{k}\right)=\left(r_{1}, \ldots, r_{s}\right)$, e.g., $y_{i}^{p_{i}^{r_{i}-1}} \notin S(t)$.

Giving the filtration on $S(t)$ by $b_{i}$, we have the isomorphism

$$
g r S(t) / p \cong \mathbb{Z} / p\left[b_{1}, \ldots, b_{\ell}\right] \otimes S(t) /\left(b_{1}, \ldots, b_{\ell}\right)
$$

Let us write for $N>0$

$$
A_{N}=\mathbb{Z} / p\left\{b_{i_{1}} \cdots b_{i_{k}}| | b_{i_{1}}\left|+\cdots+\left|b_{i_{k}}\right| \leq N\right\} \subset g r S(t) .\right.
$$

Of course $H^{*}(G / T)=0$ for $*>2 d=\operatorname{dim}_{\mathbb{R}}(G / T)$, so we have a map

$$
g r S(t) / p \rightarrow A_{2 d} \otimes S(t) /(b) \rightarrow g r C H^{*}(X) / p
$$

Lemma 5.1. The composition map is a surjection

$$
A_{2 d} \rightarrow C H^{*}(X) / p \xrightarrow{\mathrm{pr}} C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p .
$$

Proof. Recall the decomposition $M(X)_{(p)} \cong \oplus_{i} R\left(\mathbb{G}_{k}\right) \otimes \mathbb{T}^{s_{i}}$. Since the restriction map res ${ }_{\mathrm{CH}}: C H^{*}\left(\mathbb{T}^{s_{i}}\right) / p \rightarrow C H^{*}\left(\overline{\mathbb{T}}^{s_{i}}\right) / p$ is an isomorphism, we have

$$
\begin{aligned}
& C H^{*}\left(\oplus_{i} \mathbb{T}^{s_{i}}\right) / p \cong C H^{*}\left(\oplus_{i} \overline{\mathbb{T}}^{s_{i}}\right) / p \\
& \quad \cong C H^{*}\left(G_{k} / T_{k}\right) /\left(p, P(y)^{+}\right) \cong S(t) /(p, b) .
\end{aligned}
$$

Thus we can write $C H^{*}\left(\mathbb{T}^{s_{i}}\right) \cong \mathbb{Z}_{(p)}\left\{u_{i}\right\}$ for some $u_{i} \neq 0 \in S(t) /(p, b)$. Hence $C H^{*}(X) / p$ is generated by elements which are product $b \cdot u$ in $C H^{*}(X) / p$ for $b \in C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) \subset$ $C H^{*}(X) / p$ and $u \in S(t) /(p, b)$. Note $b u \neq 0$ if $b \neq 0$ in $C H^{*}(X) / p$.

On the other hand, since $C H^{*}(X)$ is versal and generated by images from $S(t)$, which is generated by $b^{\prime} u$ for $b^{\prime} \in \operatorname{Im}\left(A_{d} \rightarrow C H^{*}(X) / p\right)$. When $s_{i} \neq 0$ (i.e., $|u| \geq 2$ ), we see $\operatorname{pr}\left(b^{\prime} u\right)=0$ for the projection pr : $C H^{*}(X) / p \rightarrow C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p$. Hence we have the lemma.

From the arguments in the proof of preceding lemma, we have
Corollary 5.2. If $b \in \operatorname{Ker}(\mathrm{pr})$, then we can write $b=\sum b^{\prime} u^{\prime}$ with $b^{\prime} \in A_{2 d}$, $0 \neq u^{\prime} \in S(t) /(p, b)$, and $\left|u^{\prime}\right|>0$.

Corollary 5.3. If $b_{i} \neq 0$ in $C H^{*}(X) / p$, then so in $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p$.
Proof. Let $\operatorname{pr}\left(b_{i}\right)=0$. Then $b_{i}=\sum b^{\prime} u^{\prime}$ for $\left|u^{\prime}\right|>0$, and hence $b^{\prime} \in$ $\operatorname{Ideal}\left(b_{1}, \ldots, b_{i-1}\right)$. This contradicts $\left(b_{1}, \ldots, b_{\ell}\right)$ being regular.

Let us write

$$
y_{\text {top }}=\Pi_{i=1}^{s} y_{i}^{p^{r_{i}}-1} \quad\left(\text { resp. } t_{\text {top }}\right)
$$

the generator of the highest degree in $P(y)$ (resp. $S(t) /(b))$ so that $f=y_{\text {top }} t_{\text {top }}$ is the fundamental class in $H^{2 d}(G / T)$.

Lemma 5.4. The following map is surjective

$$
A_{N} \rightarrow C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p \quad \text { where } \quad N=\left|y_{\text {top }}\right|
$$

Proof. In the preceding lemma, $A_{N} \otimes u$ for $|u|>0$ maps zero in $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p$. Since each element in $S(t)$ is written by an element in $A_{N} \otimes S(t) /(b)$, we have the corollary.

Remark. In Section 7 in $[\mathbf{P e - S e}]$, Petrov and Semenov show

$$
C H^{*}\left(B B_{k}\right) / p \cong C H_{G_{k}}^{*}\left(\mathbb{G}_{k} / B_{k}\right) / p \cong \oplus C H_{G_{k}}^{*}\left(R_{p, G_{k}}\left(\mathbb{G}_{k}\right)\right) / p
$$

where $C H_{G_{k}}^{*}(-)$ is the $G_{k}$-equivariant Chow ring and $R_{p, G_{k}}\left(\mathbb{G}_{k}\right)$ is the $G_{k}$-equivariant generalized Rost motive. Hence we have

$$
C H_{G_{k}}^{*}\left(R_{p, G_{k}}\left(\mathbb{G}_{k}\right)\right) / p \cong A_{\infty}=\mathbb{Z} / p\left[b_{1}, \ldots, b_{\ell}\right] .
$$

Now we consider the torsion index.
Lemma 5.5. Let $\tilde{b}=b_{i_{1}} \cdots b_{i_{k}}$ in $S(t)$ such that in $H^{*}(G / T)_{(p)}$

$$
\tilde{b}=p^{s}\left(y_{t o p}+\sum y t\right), \quad|t|>0
$$

for some $y \in P(y)$ and $t \in S(t)$. Then the torsion index $t(G)_{(p)} \leq p^{s}$.
Proof. Suppose $p^{s}<t(G)_{(p)}$. We can assume $t(G)=p^{s+1}$ multiplying $p^{i}$ if necessary. Since $t t_{t o p}=0 \in S(t) /(b)$, we see

$$
t t_{t o p} \in \operatorname{Ideal}\left(b_{1}, \ldots, b_{\ell}\right) \subset \operatorname{Ideal}(p)
$$

Therefore $p^{s} \sum y t t_{t o p} \in \operatorname{Ideal}\left(p^{s+1}\right)$. So it is in $S(t)$, by Karpenko's theorem. Hence $p^{s} y_{\text {top }} t_{\text {top }} \in S(t)$. So $t(G) \leq p^{s}$ and this is a contradiction.

Corollary 5.6. In the preceding lemma, assume $p^{s}=t(G)_{(p)}$. Then for each $\operatorname{subset}\left(i_{1}^{\prime}, \ldots, i_{k^{\prime}}^{\prime}\right) \subset\left(i_{1}, \ldots, i_{k}\right)$, the element $b_{i_{1}^{\prime}}^{\prime} \cdots b_{i_{k^{\prime}}}^{\prime} \neq 0 \in C H^{*}(X) / p$.

Proof. Let us write $I^{\prime}=\left(i_{1}^{\prime}, \ldots, i_{k^{\prime}}^{\prime}\right) \subset I=\left(i_{1}, \ldots, i_{k}\right), I^{\prime} \cup I^{\prime \prime}=I$, and $b_{I}=$ $b_{i_{1}} \cdots b_{i_{k}}$. It is immediate $b_{I^{\prime}} \neq 0 \in C H^{*}(X) / p$ since $b_{I}=b_{I^{\prime}} b_{I^{\prime \prime}} \neq 0 \in C H^{*}(X) / p$.

From the above corollary, when $t(G)_{(p)}$ is big enough and there is $\tilde{b}$ in the preceding lemma, we can find many nonzero elements in $C H^{*}(X) / p$ whose restriction images are zero in $C H^{*}(\bar{X}) / p$.

## 6. The groups $G L(n), S p(n)$ and $P U(p)$.

Some results in this section are known. However we write them down since results and arguments are used in other sections. We consider the Lie group $G=U(\ell)$ at first. Note that its cohomology has no torsion. Recall that

$$
H^{*}(U(\ell)) \cong \Lambda\left(x_{1}, \ldots, x_{\ell}\right) \quad \text { with } \quad\left|x_{i}\right|=2 i-1
$$

So $P(y) / p \cong \mathbb{Z} / p$, and $C H^{*}\left(R\left(\mathbb{G}_{k}\right) / p \cong C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}\right)\right) / p \cong \mathbb{Z} / p\right.$, that is, there is no twisted form of $G_{k} / B_{k}$. Moreover $C H^{*}(X) / p \cong S(t) /\left(p, b_{1}, \ldots, b_{\ell}\right)$ for $d_{\left|x_{i}\right|+1}\left(x_{i}\right)=b_{i}$. It is well known that we can take $b_{i}=c_{i}$ the $i$-th elementary symmetric function on $S(t) \cong \mathbb{Z}\left[t_{1}, \ldots, t_{\ell}\right]$.

Proposition 6.1. Let $G=U(\ell)$ (i.e., $G_{k}=G L_{\ell}$ ) and $p$ is a prime number. Let $X=G_{k} / B_{k}$. Then

$$
C H^{*}(X) / p \cong S(t) /\left(p, c_{1}, \ldots, c_{\ell}\right)
$$

where $c_{i}$ is the Chern class in $H^{*}(B T) \cong S(t)$ by the map $T \subset U(\ell)$.
Proof. We consider the fibering $G / T \rightarrow B T \rightarrow B G$. The composition of the induced maps $H^{*}(B G) \rightarrow H^{*}(B T) \rightarrow H^{*}(G / T)$ is zero. The first map induces the isomorphism

$$
H^{*}(B G) \cong H^{*}(B T)^{W_{G}(T)} \cong \mathbb{Z}\left[c_{1}, \ldots, c_{\ell}\right]
$$

Thus $\left(b_{1}, \ldots, b_{\ell}\right) \supset\left(c_{1}, \ldots, c_{\ell}\right)$. By dimensional reason, we have the proposition.
Next consider in the case $G^{\prime}=S p(\ell)$ and recall that

$$
H^{*}(S p(\ell)) \cong \Lambda\left(x_{1}^{\prime}, \ldots, x_{\ell}^{\prime}\right) \quad \text { with } \quad\left|x_{i}^{\prime}\right|=4 i-1 .
$$

So $P(y)^{\prime} / p \cong \mathbb{Z} / p$, and there is no twisted form of $G_{k}^{\prime} / B_{k}$. Moreover we have $d_{\left|x_{i}^{\prime}\right|+1}\left(x_{i}^{\prime}\right)=$ $p_{i}$ the Pontryagin class. Hence we have

Proposition 6.2. Let $G^{\prime}=S p(\ell)$ and $X^{\prime}=G_{k}^{\prime} / B_{k}$. Then for each prime number p, we have

$$
C H^{*}\left(X^{\prime}\right) / p \cong S(t) /\left(p, p_{1}, \ldots, p_{\ell}\right) .
$$

In particular, when $p=2$, we have $C H^{*}\left(X^{\prime}\right) / 2 \cong S(t) /\left(2, c_{1}^{2}, \ldots, c_{\ell}^{2}\right)$.
Now we consider in the case $(G, p)=(P U(p), p)$, which has $p$-torsion in cohomology, but it is not simply connected. Its $\bmod (p)$ cohomology is

$$
H^{*}(G ; \mathbb{Z} / p) \cong \mathbb{Z} / p[y] /\left(y^{p}\right) \otimes \Lambda\left(x_{1}, \ldots, x_{p-1}\right) \quad|y|=2,\left|x_{i}\right|=2 i-1 .
$$

So $P(y) / p \cong \mathbb{Z} / p[y] /\left(y^{p}\right)$ with $|y|=2$. This fact is given by the fibering $U(p) \rightarrow$ $P U(p) \rightarrow B S^{1}$ and the induced spectral sequence

$$
E_{2}^{*, *^{\prime}} \cong H^{*}\left(B S^{1} ; H^{*^{\prime}}(U(p) ; \mathbb{Z} / p)\right) \Longrightarrow H^{*}(P U(p) ; \mathbb{Z} / p)
$$

Here we use that $H^{*}\left(B S^{1} ; \mathbb{Z} / p\right) \cong \mathbb{Z} / p[y]$ and $d_{2 p} x_{p}=y^{p}$.

Since $G$ is not simply connected, $G$ is not of type ( $I$ ) while $P(y)$ is generated by only one $y$. (However $C H^{*}(X) / p$ quite resembles that of type $(I)$. Compare Theorem 6.5 and Theorem 9.4 below.)

We consider the map $U(p-1) \rightarrow U(p) \rightarrow P U(p)$ where the maximal tori of $U(p-1)$ and $P U(p)$ are isomorphic, i.e., $T_{U(p-1)} \cong T_{P U(p)}$. By using the map $U(p-1) \rightarrow P U(p)$, we know $d_{2 i}\left(x_{i}\right)=c_{i}$. Hence we have

$$
\operatorname{gr} H^{*}(G / T ; \mathbb{Z} / p) \cong \mathbb{Z} / p[y] /\left(y^{p}\right) \otimes S(t) /\left(c_{1}, \ldots, c_{p-1}\right) .
$$

Lemma 6.3. Let $X$ split over a field $k^{\prime}$ over $k$ of index $p^{t} \cdot a$ for $(a, p)=1$. Then for all $y \in C H^{*}(\bar{X})$, we see $p^{t} y \in \operatorname{Im}\left(\operatorname{res}_{\mathrm{CH}}\right)$.

Proof. Using the fact that res $\otimes \mathbb{Q}$ is isomorphic, there is $s$ such that $p^{s} y=\operatorname{res}(x)$ for some $x \in C H^{*}(X)$. Then for the trace map tr, we see

$$
p^{s} \operatorname{res} \cdot \operatorname{tr}(y)=\operatorname{res} \cdot \operatorname{tr} \cdot \operatorname{res}(x)=\operatorname{res}\left(a p^{t} x\right)=a p^{s+t}(y) .
$$

Since $C H^{*}(\bar{X})$ is torsion free, we have res $\cdot \operatorname{tr}\left(a^{-1} y\right)=p^{t} y$.
Lemma 6.4. We have $p y^{i}=c_{i} \in H^{*}(G / T)_{(p)}$.
Proof. By induction on $i$, we will prove $p y^{i}=c_{i}$. It is known from $[\mathbf{P e - S e - Z a}]$ that $R\left(\mathbb{G}_{k}\right) \cong R_{1}$ (note $\mathbb{G}_{k}$ is versal). From the preceding lemma, $p y \in \operatorname{Im}\left(\operatorname{res}_{\mathrm{CH}}\right)$. By Karpenko's theorem, $p y^{i}$ is represented by elements in $C H^{*}(B T)$. Since $p y^{i} \in$ $\operatorname{Ideal}\left(c_{1}, \ldots, c_{i}\right)$, we can write, for $t(j) \in S(t), \lambda \in \mathbb{Z}$,

$$
p y^{i}=\sum_{j<i} c_{j} t(j)+\lambda c_{i} .
$$

If $\lambda=0 \in \mathbb{Z} / p$, we see $p y^{i}=\sum p y^{j} t(j)$ by inductive assumption, and this is a contradiction, since $C H^{*}(\bar{X})$ is $p$-torsion free.

Theorem 6.5. Let $G=P U(p)$ and $X=\mathbb{G}_{k} / B_{k}$. Then there are isomorphisms

$$
\begin{gathered}
C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p \cong C H^{*}\left(R_{1}\right) / p \cong \mathbb{Z} / p\left\{1, c_{1}, \ldots, c_{p-1}\right\}, \\
C H^{*}(X) / p \cong S(t) /\left(p, c_{i} c_{j} \mid 1 \leq i, j \leq p-1\right) .
\end{gathered}
$$

Proof. From $[\mathbf{P e - S e - Z a}]$, recall $R\left(\mathbb{G}_{k}\right) \cong R_{1}$. Hence the second isomorphism follows from $p y^{i}=c_{i}$ and (Example of) Theorem 4.6,

$$
C H^{*}\left(R_{1}\right) / p \cong \mathbb{Z} / p\left\{1, p y, \ldots, p y^{p-1}\right\} .
$$

From the main theorem of $[\mathrm{Pe}-\mathrm{Se}-\mathrm{Za}]$, we have the additive isomorphism

$$
C H^{*}(X) / p \cong \mathbb{Z} / p\left\{1, p y, \ldots, p y^{p-1}\right\} \otimes S(t) /(b)
$$

where $b_{i}=c_{i}$. Note $c_{i} c_{j}=p^{2} y^{i+j}=p c_{i+j}$ in $\Omega^{*}(\bar{X})$. Since res $\Omega: \Omega^{*}(X) \rightarrow \Omega^{*}(\bar{X})$ is injective, we see $c_{i} c_{j}=0 \in C H^{*}(X) / p$.

Of course we have an additive isomorphism

$$
S(t) /\left(p, c_{i} c_{j}\right) \cong \mathbb{Z} / p\left\{1, c_{1}, \ldots, c_{p-1}\right\} \otimes S(t) /\left(c_{1}, \ldots, c_{p-1}\right)
$$

Moreover we have a surjective ring map $S(t) /\left(p, c_{i} c_{j}\right) \rightarrow C H^{*}(X) / p$. From the additive isomorphism, its kernel is zero, which induces the ring isomorphism of the theorem.

Since $C H^{*}(X)$ is torsion free, we also get the above theorem by considering the restriction map $C H^{*}(X) \rightarrow C H^{*}(\bar{X})$.

We note here the following lemma for a (general) split algebraic group $G_{k}$ and a $G_{k}$-torsor $\mathbb{G}_{k}$.

Lemma 6.6. The composition of the following maps is zero for $*>0$

$$
C H^{*}\left(B G_{k}\right) / p \rightarrow C H^{*}\left(B B_{k}\right) / p \rightarrow C H^{*}\left(\mathbb{G}_{k} / B_{k}\right) / p
$$

Proof. Take $U$ (e.g., $G L_{N}$ for a large $N$ ) such that $U / G_{k}$ approximates the classifying space $B G_{k}[\mathbf{T o 3}]$. Namely, we can take $\mathbb{G}_{k}=f^{*} U$ for the classifying map $f: \mathbb{G}_{k} / G_{k} \rightarrow U / G_{k}$. Hence we have the following commutative diagram

where $U / B_{k}\left(\right.$ resp. $\left.U / G_{k}\right)$ approximates $B B_{k}\left(\right.$ resp. $\left.B G_{k}\right)$. Since $C H^{*}(\operatorname{Spec}(k)) / p=0$ for $*>0$, we have the lemma.

## 7. The orthogonal group $S O(m)$ and $p=2$.

We consider the orthogonal groups $G=S O(m)$ and $p=2$ in this section. The mod 2 -cohomology is written as (see for example [Mi-Tod], $[\mathbf{N i}]$ )

$$
g r H^{*}(S O(m) ; \mathbb{Z} / 2) \cong \Lambda\left(x_{1}, x_{2}, \ldots, x_{m-1}\right)
$$

where $\left|x_{i}\right|=i$, and the multiplications are given by $x_{s}^{2}=x_{2 s}$. We write $y_{2(o d d)}=x_{o d d}^{2}$. Hence we can write

$$
\begin{gathered}
H^{*}(S O(m) ; \mathbb{Z} / 2) \cong P(y) \otimes \Lambda\left(x_{1}, x_{3}, \ldots, x_{\bar{m}}\right) \\
\text { with } \quad P(y)=\otimes_{i=0}^{s} \mathbb{Z} / 2\left[y_{4 i+2}\right] /\left(y_{4 i+2}^{2_{i} r_{i}}\right), \quad \operatorname{gr} P(y) \cong \Lambda\left(x_{2}, x_{4}, \ldots, x_{m^{\prime}}\right)
\end{gathered}
$$

for adequate integers $\bar{m}, m^{\prime}, s, r_{i}$. For ease of argument, at first, we only consider the case $m=2 \ell+1$ so that

$$
\begin{gathered}
H^{*}(G ; \mathbb{Z} / 2) \cong P(y) \otimes \Lambda\left(x_{1}, x_{3}, \ldots, x_{2 \ell-1}\right) \\
\operatorname{grP} P(y) / 2 \cong \Lambda\left(y_{2}, \ldots, y_{2 \ell}\right),
\end{gathered}
$$

letting $y_{2 i}=x_{2 i}$ hence $y_{4 i}=y_{2 i}^{2}$. Here the suffix means its degree in this section.

The Steenrod operation is given as $S q^{k}\left(x_{i}\right)=\binom{i}{k}\left(x_{i+k}\right)$. The $Q_{i}$-operations are given by Nishimoto [ $\mathbf{N i}$ ]

$$
Q_{n} x_{2 i-1}=y_{2 i-2^{n+1}-2}, \quad Q_{n} y_{2 i}=0
$$

Considering the maps $U(\ell) \rightarrow S O(2 \ell) \rightarrow S O(2 \ell+1)$, we see that $b_{i}=c_{i} \bmod (2)$ for the transgression $d_{2 i}\left(x_{2 i-1}\right)=b_{i}$ and $c_{i}$ which is the $i$-th elementary symmetric function on $S(t)$, from Proposition 6.1 in the preceding section. Moreover we see $Q_{0}\left(x_{2 i-1}\right)=y_{2 i}$ in $H^{*}(G ; \mathbb{Z} / 2)$. From Lemma 3.1 or Corollary 3.2, we have

$$
2 y_{2 i}=c_{i} \quad \bmod (4)
$$

in $H^{*}(G / T)$. Indeed, the cohomology $H^{*}(G / T)$ is computed completely by TodaWatanabe [Tod-Wa].

Theorem 7.1 ([Tod-Wa]). There are $y_{2 i} \in H^{*}(G / T)$ for $1 \leq i \leq \ell$ such that $\pi^{*}\left(y_{2 i}\right)=y_{2 i}$ for $\pi: G \rightarrow G / T$, and that we have an isomorphism

$$
H^{*}(G / T) \cong \mathbb{Z}\left[t_{i}, y_{2 i}\right] /\left(c_{i}-2 y_{2 i}, J_{2 i}\right)
$$

where $J_{2 i}=1 / 4\left(\sum_{j=0}^{2 i}(-1)^{j} c_{j} c_{2 i-j}\right)=y_{4 i}-\sum_{0<j<2 i}(-1)^{j} y_{2 j} y_{4 i-2 j}$ letting $y_{2 j}=0$ for $j>\ell$.

By using Nishimoto's result for $Q_{i}$-operation, from Corollary 3.2, we have
Corollary 7.2. In $B P^{*}(G / T) / I_{\infty}^{2}$, we have

$$
c_{i}=2 y_{2 i}+\sum_{n \geq 1} v_{n} y\left(2 i+2^{n+1}-2\right)
$$

for some $y(j)$ with $\pi^{*}(y(i))=y_{i}$.
It is known by Marlin and Merkurjev (see [To2] for details) that the torsion index of $S O(2 \ell+1)$ (and $S O(2 \ell+2)$ ) is $2^{\ell}$. Here we give an another proof.

Theorem 7.3. $\quad t(G)=t(S O(2 \ell+1))=2^{\ell}$.
Proof. We consider in $H^{*}(G / T)$

$$
c_{1} \cdots c_{\ell}=\left(2 y_{2}\right)\left(2 y_{4}\right) \cdots\left(2 y_{2 \ell}\right)=2^{\ell} y_{t o p}
$$

where $y_{\text {top }}=y_{2} \cdots y_{2 \ell}$. Hence $t(G) \leq 2^{\ell}$.
Conversely, let $2^{\ell-1} y_{t o p}=t$ in $S(t)$. Then $t=0 \in H^{*}(G / T ; \mathbb{Z} / 2)$ and hence $t$ is in the ideal $\left(c_{1}, \ldots, c_{\ell}\right)$ in $S(t)$. So we can write $t=\sum c_{i} t(i)$. Then we have

$$
2^{\ell-1} y_{t o p}=2 \sum y_{2 i} t(i)
$$

which implies $2^{\ell-2} y_{t o p}=\sum y_{2 i} t(i)$ since $H^{*}(G / T)$ has no torsion.
Continue this argument. Then we have a relation $y_{t o p}=\sum y t$ with $t \in S(t)$ where
the number of $y_{2 s}$ in each monomial in $y$ is less or equal to $\ell-1$, while the number for $y_{\text {top }}$ is $\ell$. This is a contradiction.

Let $W=W_{S O(2 \ell+1)}(T)$ be the Weyl group. Then $W \cong S_{\ell}^{ \pm}$is generated by permutations and change of signs so that $\left|S_{\ell}^{ \pm}\right|=2^{\ell} \ell$ !. Hence we have

$$
H^{*}(B T)^{W} \cong \mathbb{Z}_{(2)}\left[p_{1}, \ldots, p_{\ell}\right] \subset H^{*}(B T) \cong \mathbb{Z}_{(2)}\left[t_{1}, \ldots, t_{\ell}\right],\left|t_{i}\right|=2
$$

where the Pontryagin class $p_{i}$ is defined by $\Pi_{i}\left(1+t_{i}^{2}\right)=\sum_{i} p_{i}$. Consider the maps

$$
\eta: T \stackrel{\eta_{1}}{\subset} U(\ell) \rightarrow S O(2 \ell+1) \xrightarrow{\eta_{2}} U(2 \ell+1)
$$

Then $c_{2 i}(\eta)=p_{i} \in C H^{*}(B T)^{W}$ which is also the image of $c_{2 i}\left(\eta_{2}\right)$ in $C H^{*}(B S O(2 \ell+1))$.
On the other hand, $p_{i}=c_{i}\left(\eta_{1}\right)^{2} \bmod (2)$, where $c_{i}\left(\eta_{1}\right)=\sigma_{i}$ is the elementary symmetric function in $S(t)$. Now we consider a versal torsor $\mathbb{G}_{k}$ and the versal flag $X=\mathbb{G}_{k} / B_{k}$. From Lemma 6.6, the composition of the following maps

$$
C H^{*}\left(B G_{k}\right) / 2 \rightarrow C H^{*}\left(B B_{k}\right) / 2 \rightarrow C H^{*}(X) / 2
$$

is zero for $*>0$, we get $c_{i}\left(\eta_{1}\right)^{2}=\sigma_{i}^{2}=0$ in $C H^{*}(X) / 2$.
This fact is also seen directly from considering the natural inclusion $S O(2 \ell+1) \rightarrow$ $S p(2 \ell+1)$ and Proposition 6.2.

Lemma 7.4. We have $c_{i}^{2}=0$ in $C H^{*}(X) / 2$.
Lemma 7.5. There is an additive injection

$$
\mathbb{Z} / 2\left[c_{1}, \ldots, c_{\ell}\right] /\left(c_{1}^{2}, \ldots, c_{\ell}^{2}\right)=\Lambda\left(c_{1}, \ldots, c_{\ell}\right) \subset C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2
$$

Proof. At first we note that $c_{1} \cdots c_{\ell} \neq 0$ in $C H^{*}(X) / 2$. Otherwise, it is represented by $2 S(t)$ since $C H^{*}(X)$ is generated by elements from $S(t)$. It means that $2^{\ell-1} y_{\text {top }}=1 / 2\left(c_{1} \cdots c_{\ell}\right) \in S(t)$. Hence $t(G)<2^{\ell}$ and it is a contradiction.

For $I=\left(i_{1}, \ldots, i_{k}\right) \subset(1, \ldots, \ell)$, let $c_{I}=c_{i_{1}} \cdots c_{i_{k}}$ and $y_{I}=y_{2 i_{1}} \cdots y_{2 i_{k}}$ and $|I|=k$. Suppose $c_{I} \in \operatorname{Ker}(\mathrm{pr})$ for $\mathrm{pr}: \mathrm{CH}^{*}(\mathrm{X}) / 2 \rightarrow \mathrm{CH}^{*}\left(\mathrm{R}\left(\mathbb{G}_{\mathrm{k}}\right)\right) / 2$. Then from Corollary 5.2, we can write

$$
c_{I}=\sum_{J} c_{J} u(J)
$$

with $u(J) \in S(t)$ and $|u(J)|>0$ for some $J$, since $c_{I}$ is not zero in $C H^{*}(X) / 2$.
Then we have $2^{|I|} y_{I}=\sum_{J} 2^{|J|} y_{j} u(j)$. Since $H^{*}(G / T)$ has no 2-torsion, dividing by $\min \left(2^{|I|}, 2^{|J|}\right)$, we have a contradiction since $H^{*}(G / T ; \mathbb{Z} / 2) \cong P(y) \otimes S(t) /(b)$. Thus $c_{I} \neq 0$ in also $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2$.

Theorem 7.6. Let $(G, p)=(S O(2 \ell+1), 2)$ and $X=\mathbb{G}_{k} / B_{k}$. Then there are isomorphisms

$$
C H^{*}(X) / 2 \cong S(t) /\left(2, c_{1}^{2}, \ldots, c_{\ell}^{2}\right), \quad C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2 \cong \Lambda\left(c_{1}, \ldots, c_{\ell}\right) .
$$

Proof. We have the additive and surjective map

$$
\begin{aligned}
& \operatorname{gr}\left(S(t) /\left(2, c_{1}^{2}, \ldots, c_{\ell}^{2}\right)\right) \cong \Lambda\left(c_{1}, \ldots, c_{\ell}\right) \otimes S(t) /\left(c_{1}, \ldots, c_{\ell}\right) \\
& \quad \rightarrow C H^{*}(X) / 2 \cong C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) \otimes S(t) /\left(2, c_{1}, \ldots, c_{\ell}\right) .
\end{aligned}
$$

Therefore we see $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2 \cong \Lambda\left(c_{1}, \ldots, c_{\ell}\right)$ from the preceding lemma. From Lemma 7.4, we have the ring homomorphism

$$
S(t) /\left(2, c_{1}^{2}, \ldots, c_{\ell}^{2}\right) \rightarrow C H^{*}(X) / 2
$$

which induces the ring isomorphism from the additive isomorphism.
Corollary 7.7. In the above theorem, $C H^{*}(X)$ is torsion free.
Proof. Let us write $\Lambda_{\mathbb{Z}}\left(a_{1}, \ldots, a_{m}\right)=\mathbb{Z}\left\{a_{i_{1}} \cdots a_{i_{s}} \mid 1 \leq i_{1}<\cdots<i_{s} \leq m\right\}$. We consider the restriction maps

$$
C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) \cong \Lambda_{\mathbb{Z}}\left(c_{1}, \ldots, c_{\ell}\right) / J \xrightarrow{(1)} C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}\right)\right) \cong \Lambda_{\mathbb{Z}}\left(y_{2}, \ldots, y_{2 \ell}\right)
$$

(2)
$C H^{*}(X)$
(3) $\downarrow i n j$.
$C H^{*}(\bar{X})$.
for some module $J$. The map (1) (and (4)) is given by $c_{i} \mapsto 2 y_{2 i}$, and since the last map (4) is a ring map, we see that (4)(2) maps $c_{i_{1}} \cdots c_{i_{s}} \mapsto 2^{s} y_{i_{1}} \cdots y_{i_{s}}$, which is injective. Hence the first map (1) is (additively) injective and $J=0$. Thus $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right)$ is torsion free, and so is $C H^{*}(X)$ from the theorem by Petrov, Semenov and Zainoulline such that $M(X)_{(2)} \cong \oplus_{i} R\left(\mathbb{G}_{k}\right) \otimes \mathbb{T}^{i \otimes}$.

Remark. The above lemmas, theorem and corollary are also given from a result by Petrov (Theorem 1 in $[\mathrm{Pe}]$, see also Theorem 7.13 below).

Corollary 7.8. Let $\left(G^{\prime}, p\right)=(S O(2 \ell), 2)$ and $X^{\prime}=\mathbb{G}_{k}^{\prime} / B_{k}$ so that $G^{\prime} \subset G=$ $S O(2 \ell+1)$. Then $t\left(G^{\prime}\right)=2^{\ell-1}$, and

$$
\begin{aligned}
& C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2 \cong C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) /\left(2, c_{\ell}\right) \cong \Lambda\left(c_{1}, \ldots, c_{\ell-1}\right), \\
& C H^{*}\left(X^{\prime}\right) / 2 \cong C H^{*}(X) /\left(2, c_{\ell}\right) \cong S(t) /\left(2, c_{1}^{2}, \ldots, c_{\ell-1}^{2}, c_{\ell}\right)
\end{aligned}
$$

Proof. This corollary is easily shown from $H^{*}\left(G^{\prime} ; \mathbb{Z} / 2\right) \cong H^{*}(G ; \mathbb{Z} / 2) /\left(y_{2 \ell}\right)$. For example, $\operatorname{gr} P(y)^{\prime} \cong \Lambda\left(y_{2}, \ldots, y_{2 \ell-2}\right)$ and $t\left(G^{\prime}\right)=2^{\ell-1}$.

From Proposition 6.2 and Theorem 7.6, we note
Corollary 7.9. Let $G^{\prime \prime}=S p(2 \ell+1)$ and $X^{\prime \prime}=\mathbb{G}_{k}^{\prime \prime} / B_{k}^{\prime \prime}$. Then the natural maps $G \rightarrow G^{\prime \prime} \supset S p(\ell)$ induce the isomorphisms

$$
C H^{*}(X) / 2 \cong C H^{*}\left(X^{\prime \prime}\right) /\left(2, t_{i} \mid i>\ell\right) \cong H^{*}(S p(\ell) / T ; \mathbb{Z} / 2) .
$$

We now study $C H^{*}\left(\left.X\right|_{K}\right) / 2$ for some interesting extension $K$ over $k$. Let $K$ be an extension of $k$ such that $X$ does not split over $K$ but splits over an extension over $K$ of degree $2 a,(a, 2)=1$. Suppose that

$$
\text { (*) } y_{2 i} \in \operatorname{Res}_{\mathrm{K}}, \text { for } 1 \leq i \leq \ell-1
$$

where $\operatorname{Res}_{K}=\operatorname{Im}\left(\right.$ res : $\left.C H^{*}\left(\left.X\right|_{K}\right) / 2 \rightarrow C H^{*}(\bar{X}) / 2\right)$. We want to consider the case $y_{2 \ell} \notin \operatorname{Res}_{\mathrm{K}}$.

Lemma 7.10. Suppose ( $*$ ) and $\ell \neq 2^{n}-1$ for $n>0$. Then $y_{2 \ell} \in \operatorname{Res}_{\mathrm{K}}$.
Proof. We see that if $\ell \neq 2^{n}-1$, then each $y_{2 \ell}$ is a target of the Steenrod operation $S q^{2 k}$. Recall $S q^{2 k}\left(y_{2 i}\right)=\binom{i}{k} y_{2(i+k)}$. It is well known that if $i=\sum i_{s} 2^{s}$ and $k=\sum k_{s} 2^{s}$ for $i_{s}, k_{s}=0$ or 1, then (in $\bmod$ (2))

$$
\binom{i}{k}=\binom{i_{m}}{k_{m}} \cdots\binom{i_{s}}{k_{s}} \cdots\binom{i_{0}}{k_{0}} .
$$

Note that if $i=2^{n}-1$, then all $i_{s}=1$ (for $s<n$ ). Otherwise there is $s$ such that $i_{s}=1$ but $i_{s-1}=0$. Take $k=2^{s-1}$ and $i^{\prime}=i-2^{s-1}$. Then $i^{\prime}+k=i$ and

$$
\binom{i^{\prime}}{k}=\binom{i_{m}=1}{0} \cdots\binom{i_{s}^{\prime}=0}{k_{s}=0}\binom{1}{1} \cdots\binom{i_{0}}{0}=1 .
$$

This means $S q^{2 k}\left(y_{2 i^{\prime}}\right)=y_{2 i}$ if $i \neq 2^{n}-1$.
Lemma 7.11. Suppose (*) and $\ell=2^{n}-1$. Then elements py $y_{2 \ell}, v_{1} y_{2 \ell}, \ldots, v_{n-1} y_{2 \ell}$ are all in $\operatorname{Im}\left(\operatorname{res}_{\Omega}\right)$ where $\operatorname{res}_{\Omega}: \Omega^{*}(X) / 2 \rightarrow \Omega^{*}(\bar{X}) / 2$.

Proof. From Corollary 7.2, we see

$$
\begin{aligned}
c_{\ell-2^{j}+1} & =2 y\left(2\left(\ell-2^{j}+2^{0}\right)\right)+v_{1} y\left(2\left(\ell-2^{j}+2^{1}\right)\right)+\cdots+v_{j}(y(2 \ell)) \\
& =v_{j}\left(y_{2 \ell}\right) \bmod \left(y_{2}, y_{4}, \ldots, y_{2 \ell-2}\right) .
\end{aligned}
$$

Hence we have $\operatorname{res}_{\Omega}\left(c_{\ell-\left(2^{j}-1\right)}\right)=v_{j}\left(y_{2 \ell}\right) \bmod \left(y_{2}, y_{4}, \ldots, y_{2 \ell-2}\right)$.
Thus we have
Theorem 7.12. Suppose (*) and $\ell=2^{n}-1$. Then

$$
C H^{*}\left(\left.R\left(\mathbb{G}_{k}\right)\right|_{K}\right) / 2 \cong \Lambda\left(y_{2}, \ldots, y_{2 \ell-2}\right) \otimes C H^{*}\left(R_{n}\right) / 2,
$$

with $C H^{*}\left(R_{n}\right) / 2 \cong \mathbb{Z} / 2\left\{1, c_{0}\left(y_{2 \ell}\right), \ldots, c_{n-1}\left(y_{2 \ell}\right)\right\} \cong \mathbb{Z} / 2\left\{1, p y_{2 \ell}, \ldots, v_{n-1} y_{2 \ell}\right\}$. Moreover we have

$$
\operatorname{res}_{\mathrm{k}}^{\mathrm{K}}\left(C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2\right) \cong C H^{*}\left(R_{n}\right) / 2 \subset C H^{*}\left(\left.R\left(\mathbb{G}_{k}\right)\right|_{K}\right) / 2
$$

The restriction maps are given $c_{j} \mapsto c_{s}\left(y_{2 \ell}\right)=v_{s} y_{2 \ell}$ if $j=\ell-\left(p^{s}-1\right)$, and $c_{j} \mapsto 0$ otherwise.

At last of this section, we consider the case $X(\mathbb{C})=G / P$ with

$$
G=S O(2 \ell+1) \quad \text { and } \quad P=U(\ell) .
$$

Let us write this $X$ by $Y$, i.e., $Y=\mathbb{G}_{k} / P_{k}$. From the fibering $S O(2 \ell+1) \rightarrow Y(\mathbb{C}) \rightarrow$ $B U(\ell)$, we have the spectral sequence

$$
\begin{aligned}
E_{2}^{*, *^{\prime}} & \cong H^{*}(S O(2 \ell+1) ; \mathbb{Z} / 2) \otimes H^{*^{\prime}}(B U(\ell)) \\
& \cong P(y) \otimes \Lambda\left(x_{1}, \ldots, x_{2 \ell-1}\right) \otimes \mathbb{Z} / 2\left[c_{1}, \ldots, c_{\ell}\right] \Longrightarrow H^{*}(Y(\mathbb{C}) ; \mathbb{Z} / 2)
\end{aligned}
$$

Here the differential is given as $d_{2 i}\left(x_{2 i-1}\right)=c_{i}$. Hence

$$
C H^{*}(\bar{Y} ; \mathbb{Z} / 2) \cong H^{*}(Y(\mathbb{C}) ; \mathbb{Z} / 2) \cong P(y) / 2
$$

This case is studied by Vishik $[\mathbf{V i}]$ and Petrov $[\mathbf{P e}]$ as maximal orthogonal (or quadratic) grassmannian. (see Theorem 5.1 in $[\mathbf{V i}]$ ). From Theorem 7.6, we have

Theorem $7.13([\mathbf{P e}],[\mathbf{V i}])$. Let $G=S O(2 \ell+1)$ and $\mathbb{G}_{k}$ be a versal $G_{k}$-torsor. Let $Y=\mathbb{G}_{k} / U(\ell)_{k}$. Then

$$
C H^{*}(Y) / 2 \cong C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2 \cong \Lambda\left(c_{1}, \ldots, c_{\ell}\right) .
$$

Remark. Petrov computes the integral Chow ring for more general situations [Pe]. From the above theorem, we note that $C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2$ has the ring structure in this case.

In $[\mathbf{V i}]$, Vishik originally defined the $J$-invariant $J(q)$ of a quadratic form $q$ which corresponds to the quadratic grassmannian (see Definition 5.11, Corollary 5.10 in $[\mathbf{V i}]$ ) by

$$
J(q)=\left\{i_{k} \mid y_{2 i_{k}} \in \operatorname{Res}_{\mathrm{CH}}\right\} \subset\{0, \ldots, \ell\} .
$$

Let $I$ be the fundamental ideal of the Witt ring $W(k)$ so that $\operatorname{gr} W(k)=\oplus_{n} I^{n} / I^{n+1} \cong$ $K_{*}^{M}(k) / 2$ where $K_{*}^{M}(k)$ is the Milnor $K$-theory of $k$. Smirnov and Vishik (Proposition 3.2.31 in $[\mathbf{S m}-\mathbf{V i}]$ ) prove that

$$
q \in I^{n} \quad \text { if and only if } \quad\left\{0, \ldots, 2^{n-1}-2\right\} \subset J(q)
$$

Hence the condition (*) in Theorem 7.12 is equivalent to $q \in I^{n}$ for the quadratic form $q$ corresponding to $\left.Y\right|_{K}$. We also note that $G=\operatorname{Spin}(m)$ cases correspond to $q \in I^{3}$ from $1, y_{2}, y_{4} \in \operatorname{Res}_{\mathrm{CH}}$ (see (8.1) below). This fact is of course, well known.

## 8. The spin group $\operatorname{Spin}(2 \ell+1)$ and $p=2$.

Throughout this section, let $p=2, G=S O(2 \ell+1)$ and $G^{\prime}=\operatorname{Spin}(2 \ell+1)$. By definition, we have the 2 covering $\pi: G^{\prime} \rightarrow G$. It is well known that $\pi^{*}: H^{*}(G / T) \cong$ $H^{*}\left(G^{\prime} / T^{\prime}\right)$ where $T^{\prime}$ is a maximal torus of $G^{\prime}$. However the twisted flag varieties are not isomorphic.

Let $2^{t} \leq \ell<2^{t+1}$, i.e., $t=\left[\log _{2} \ell\right]$. The $\bmod 2$ cohomology is

$$
\begin{aligned}
H^{*}\left(G^{\prime} ; \mathbb{Z} / 2\right) & \cong H^{*}(G ; \mathbb{Z} / 2) /\left(x_{1}, y_{2}\right) \otimes \Lambda(z) \\
& \cong P(y)^{\prime} \otimes \Lambda\left(x_{3}, x_{5}, \ldots, x_{2 \ell-1}\right) \otimes \Lambda(z), \quad|z|=2^{t+2}-1
\end{aligned}
$$

where $P(y) \cong \mathbb{Z} / 2\left[y_{2}\right] /\left(y_{2}^{2^{t+1}}\right) \otimes P(y)^{\prime}$. (Here the element $z$ is defined by $d_{2^{t+2}}(z)=y_{2}^{2^{t+1}}$ for $0 \neq y_{2} \in H^{2}(B \mathbb{Z} / 2 ; \mathbb{Z} / 2)$ in the spectral sequence induced from the fibering $G^{\prime} \rightarrow$ $G \rightarrow B \mathbb{Z} / 2$.) Hence

$$
\begin{equation*}
\operatorname{gr} P(y)^{\prime} \cong \otimes_{2 i \neq 2^{j}} \Lambda\left(y_{2 i}\right) \cong \Lambda\left(y_{6}, y_{10}, y_{12}, \ldots, y_{2 \bar{\ell}}\right) \tag{8.1}
\end{equation*}
$$

where $\bar{\ell}=\ell-1$ if $\ell=2^{j}$, and $\bar{\ell}=\ell$ otherwise. The $Q_{i}$ operation for $z$ is given by Nishimoto [ $\mathbf{N i} \mathbf{i}]$

$$
Q_{0}(z)=\sum_{i+j=2^{t+1}, i<j} y_{2 i} y_{2 j}, \quad Q_{n}(z)=\sum_{i+j=2^{t+1}+2^{n+1}-2, i<j} y_{2 i} y_{2 j}
$$

for $n \geq 1$.
We know that

$$
\begin{gathered}
\operatorname{gr} H^{*}(G / T) / 2 \cong P(y)^{\prime} \otimes \mathbb{Z}\left[y_{2}\right] /\left(y_{2}^{2^{t+1}}\right) \otimes S(t) /\left(2, c_{1}, c_{2}, \ldots, c_{\ell}\right) \\
g r H^{*}\left(G^{\prime} / T^{\prime}\right) / 2 \cong P(y)^{\prime} \otimes S\left(t^{\prime}\right) /\left(2, c_{2}^{\prime}, \ldots, c_{\ell}^{\prime}, c_{1}^{2^{t+1}}\right) .
\end{gathered}
$$

Here $c_{i}^{\prime}=\pi^{*}\left(c_{i}\right)$ and $d_{2^{t+2}}(z)=c_{1}^{2^{t+1}}$ in the spectral sequence converging $H^{*}\left(G^{\prime} / T^{\prime}\right)$. These are additively isomorphic. In particular, we have

Lemma 8.1. The element $\pi^{*}\left(y_{2}\right)=c_{1} \in S\left(t^{\prime}\right)$ and $\pi^{*}\left(t_{j}\right)=c_{1}+t_{j}$ for $1 \leq j \leq \ell$.
Take $k$ such that $\mathbb{G}_{k}$ is a versal $G_{k}$-torsor so that $\mathbb{G}_{k}^{\prime}$ is also a versal $G_{k}^{\prime}$-torsor. Let us write $X=\mathbb{G}_{k} / B_{k}$ and $X^{\prime}=\mathbb{G}_{k}^{\prime} / B_{k}^{\prime}$. Then

$$
C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2 \cong P(y)^{\prime} / 2, \quad \text { and } \quad C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}\right)\right) / 2 \cong P(y) / 2
$$

Theorem 8.2. Let $(G, p)=(S O(2 \ell+1), 2),\left(G^{\prime}, p\right)=(\operatorname{Spin}(2 \ell+1), 2)$, and $\pi:$ $G^{\prime} \rightarrow G$ be the natural projection. Let $c_{i}^{\prime}=\pi^{*}\left(c_{i}\right)$. Then $\pi^{*}$ induces maps such that their composition map is surjective

$$
C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) /\left(2, c_{1}\right) \cong \Lambda\left(c_{2}, \ldots, c_{\ell}\right) \xrightarrow{\pi^{*}} C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2 \rightarrow \mathbb{Z} / 2\left\{1, c_{2}^{\prime}, \ldots, c_{\bar{\ell}}^{\prime}\right\}
$$

where $\bar{\ell}=\ell-1$ if $\ell=2^{j}$ for some $j>0$, otherwise $\bar{\ell}=\ell$.
Proof. From Corollary 5.3, we only need to show $c_{i}^{\prime} \neq 0$ in $\Omega^{*}\left(G_{k}^{\prime} / T_{k}^{\prime}\right) /\left(I_{\infty}\right.$. $\operatorname{Im}\left(\operatorname{res}_{\Omega}\right)$ ). In fact, when $i \neq 2^{j}$, in $H^{*}\left(G^{\prime} / T^{\prime}\right) / 4$, we have

$$
2 y_{2 i}=c_{j}^{\prime} \in S(t)
$$

which is nonzero in $B P^{*}(G / T) /\left(I_{\infty} \cdot \operatorname{Im}\left(\operatorname{res}_{\Omega}\right)\right)$. Because $y_{2 i} \in P(y)^{\prime}$ and $y_{2 i} \notin \operatorname{Im}\left(\operatorname{res}_{\mathrm{CH}}\right)$ from Lemma 4.5 since $X$ is a versal flag variety.

When $i=2^{j}$, we note $y_{2 i}=y_{2^{j}} \in S\left(t^{\prime}\right)$, in fact $y_{2^{j}} \notin P(y)^{\prime}$. But in $B P^{*}\left(G^{\prime} / T^{\prime}\right) / I_{\infty}^{2}$,
we have

$$
2 y_{2 i}+v_{1}(y(2 i+2))+\cdots+v_{n}\left(y\left(2 i+2^{n+1}-2\right)\right)+\cdots=c_{i}^{\prime} \in B P^{*}\left(B T^{\prime}\right)
$$

When $i+1 \leq \ell$, this element is nonzero in $B P^{*}(G / T) / I_{\infty} \cdot \operatorname{Im}\left(\mathrm{res}_{\Omega}\right)$ because

$$
c_{i}^{\prime}=v_{1}(y(2 i+2)) \neq 0 \in k(1)^{*}(G / T) /\left(v_{1} \cdot \operatorname{Im}\left(\operatorname{res}_{k(1)}\right)\right)
$$

where $\operatorname{res}_{k(1)}: k(1)^{*}\left(X^{\prime}\right) \rightarrow k(1)^{*}(\bar{X})$. Otherwise $y(2 i+2) \in \operatorname{Im}\left(\operatorname{res}_{\mathrm{CH}}\right)$, and this is a contradiction since $y_{2^{j}+2} \notin \operatorname{Im}\left(\right.$ res $\left._{\mathrm{CH}}\right)$, which follows from $y_{2 j+2} \in P(y)^{\prime}$ and Corollary 4.5.

When $2^{j}=\ell$, we note

$$
C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2 \cong C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}^{\prime \prime}\right)\right) / 2 \quad \text { for } G^{\prime \prime}=\operatorname{Spin}(2 \ell-1),
$$

in fact $y_{2 \ell}=y_{2^{j}} \notin C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}^{\prime}\right)\right)$. From a theorem by Vishik-Zainoulline (Corollary 6 in [Vi-Za]), we get $C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2 \cong C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime \prime}\right)\right) / 2$. Hence we can take $c_{\ell}^{\prime}=0$.

Corollary 8.3. The elements $c_{2^{j}}^{\prime \prime}=c_{2^{j}}^{\prime}-c_{1}^{2^{j}}, j>0$ are torsion elements in $C H^{*}(X)_{(2)}$.

Proof. Note that $\operatorname{res}_{\Omega}\left(\mathrm{c}_{2 \mathrm{j}}^{\prime \prime}\right) \in \mathrm{BP}^{<0} \cdot \Omega^{*}(\overline{\mathrm{X}})$, and $\operatorname{res}_{\mathrm{CH}}\left(\mathrm{c}_{2 \mathrm{j}}^{\prime \prime}\right)=0 \in \mathrm{CH}^{*}(\overline{\mathrm{X}})$. It is well known that $\operatorname{res}_{\mathrm{CH}} \otimes \mathbb{Q}$ is isomorphic. Hence $c_{2 j}^{\prime \prime}$ must be torsion.

Example. Let $G=S O(7)$ and $G^{\prime}=\operatorname{Spin}(7)$, i.e., $\ell=3$. Their cohomologies are

$$
\begin{gathered}
H^{*}(G ; \mathbb{Z} / 2) \cong \mathbb{Z} / 2\left[y_{2}, y_{6}\right] /\left(y_{2}^{4}, y_{6}^{2}\right) \otimes \Lambda\left(x_{1}, x_{3}, x_{5}\right) \\
H^{*}\left(G^{\prime} ; \mathbb{Z} / 2\right) \cong \mathbb{Z} / 2\left[y_{6}\right] /\left(y_{6}^{2}\right) \otimes \Lambda\left(x_{3}, x_{5}, z_{7}\right)
\end{gathered}
$$

The cohomologies of flag manifolds are

$$
\begin{gathered}
H^{*}(G / T ; \mathbb{Z} / 2) \cong \mathbb{Z} / 2\left[y_{2}, y_{6}\right] /\left(y_{2}^{4}, y_{6}^{2}\right) \otimes S(t) /\left(c_{1}, c_{2}, c_{3}\right), \\
H^{*}\left(G^{\prime} / T^{\prime} ; \mathbb{Z} / 2\right) \cong \mathbb{Z} / 2\left[y_{6}\right] /\left(y_{6}^{2}\right) \otimes S(t) /\left(c_{2}^{\prime}, c_{3}^{\prime}, c_{1}^{4}\right)
\end{gathered}
$$

These cohomologies are isomorphic by $\pi^{*}\left(y_{2}\right)=c_{1}$. The torsion indexes are $t(G)=2^{3}$ and $t\left(G^{\prime}\right)=2$. The Chow rings of versal flag varieties are

$$
\begin{gathered}
C H^{*}(X) / 2 \cong S(t) /\left(2, c_{1}^{2}, c_{2}^{2}, c_{3}^{2}\right), \quad C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2 \cong \Lambda\left(c_{1}, c_{2}, c_{3}\right) \\
C H^{*}\left(X^{\prime}\right) / 2 \cong S(t) /\left(2,\left(c_{2}^{\prime}\right)^{2}, c_{2}^{\prime} c_{3}^{\prime},\left(c_{3}^{\prime}\right)^{2}, c_{1}^{4}\right), \quad C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2 \cong \mathbb{Z} / 2\left\{1, c_{2}^{\prime}, c_{3}^{\prime}\right\} .
\end{gathered}
$$

Here $\pi^{*}\left(t_{i}\right)=c_{1}+t_{i}$ so that $\pi^{*}\left(c_{1}\right)=0 \bmod (2)$. For the third and the last isomorphisms, see Corollary 9.5 below. In fact $G^{\prime}$ is a group of type ( $I$ ).

Lemma 8.4 (Marlin's bound). The torsion index $t\left(G^{\prime}\right)$ divides $2^{\ell-\left[\log _{2} \ell\right]-1}$.
Proof. It follows from

$$
\Pi_{i \neq 2^{j}} c_{i}=\Pi_{i \neq 2^{j}}\left(2 y_{2 i}\right)=2^{\ell-t-1} y_{t o p}^{\prime}
$$

where $y_{\text {top }}^{\prime}$ is the generator of top degree elements in $P(y)^{\prime}$.
The exact value of $t\left(G^{\prime}\right)$ is determined by Totaro, namely $t\left(G^{\prime}\right)=\ell-\left[\log _{2}\left(\binom{\ell+1}{2}+1\right)\right]$ or that expression plus 1. (It is known $t(\operatorname{Spin}(2 \ell+1))=t(\operatorname{Spin}(2 \ell+2)))$.

Marlin's bound fails first for $\operatorname{Spin}(11)$. This fact was first found by using a property of 12 -dimensional quadratic forms $[\mathbf{T o} 2]$. However we show it using the $Q_{0}$-operation.

Lemma 8.5. For $\left(G^{\prime}, p\right)=(\operatorname{Spin}(11), 2)$, we have $t\left(G^{\prime}\right)=2$ and the surjection

$$
C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2 \rightarrow \mathbb{Z} / 2\left\{1, c_{2}^{\prime}, c_{3}^{\prime}, c_{4}^{\prime}, c_{5}^{\prime}, c_{2}^{\prime} c_{4}^{\prime}, c_{1}^{8}\right\} .
$$

Proof. Recall the cohomology

$$
H^{*}\left(G^{\prime} ; \mathbb{Z} / 2\right) \cong \mathbb{Z} / 2\left[y_{6}, y_{10}\right] /\left(y_{6}^{2}, y_{10}^{2}\right) \otimes \Lambda\left(x_{3}, x_{5}, x_{7}, x_{9}, z_{15}\right)
$$

By Nishimoto, we know $Q_{0}\left(z_{15}\right)=y_{6} y_{10}$. It implies $2 y_{6} y_{10}=d_{16}\left(z_{15}\right)=c_{1}^{8}$. Since $y_{\text {top }}^{\prime}=$ $y_{6} y_{10}$, we have $t\left(G^{\prime}\right)=2$. (Note that $c_{1}^{8} \neq 0 \in C H^{*}(R(\mathbb{G})) / 2$, otherwise $t\left(G^{\prime}\right)=1$.)

We will show $c_{2}^{\prime} c_{4}^{\prime} \neq 0 \in C H^{*}(X) / 2$. The elements $c_{2}^{\prime}, c_{3}^{\prime}, c_{4}^{\prime}$ in $C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2$ correspond to $v_{1} y_{6}, 2 y_{6}, v_{1} y_{10}$ in $\Omega^{*}\left(\bar{R}\left(\mathbb{G}_{k}^{\prime}\right)\right)$ respectively. In particular $c_{2}^{\prime} c_{4}^{\prime}$ corresponds to $v_{1}^{2} y_{6} y_{10}$. If $c_{2}^{\prime} c_{4}^{\prime}=0 \in C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / 2$, then $v_{1} y_{6} y_{10}$ must be in $\operatorname{Re} s_{\Omega}$. This means $v_{1} y_{6} y_{10}=b^{\prime \prime}$ for some $b^{\prime \prime} \in B P^{*}\left(B T^{\prime}\right)$. However there is no $x \in H^{13}\left(G^{\prime} ; \mathbb{Z} / 2\right)$ such that $Q_{1}(x)=y_{6} y_{10}$ with $d_{12}(x)=b^{\prime \prime}$.

Remark. Quite recently, Karpenko ([Ka2]) showed that the above surjection is an isomorphism.

In most cases, from the result of Totaro, we see $\Pi_{i \neq 2^{j}} c_{i}^{\prime}=0$. However from [To2] when $\ell=8$, we know that $2^{\ell-\left[\log _{2}(\ell)\right]-1}=2^{4}=t(\operatorname{Spin}(17))$. (Note $y_{16}-2 y_{6} y_{10} \in S(t)$ but $y_{16} \notin S(t)$ when $\ell=8$.) Hence we have

Lemma 8.6. Let $\ell \geq 8$ and $G^{\prime}=\operatorname{Spin}(2 \ell+1)$, and $X^{\prime}=\mathbb{G}_{k}^{\prime} / B_{k}^{\prime}$. Then we have

$$
c_{3}^{\prime} c_{5}^{\prime} c_{6}^{\prime} c_{7}^{\prime}, c_{3}^{\prime} c_{4}^{\prime} c_{6}^{\prime} c_{7}^{\prime} \neq 0 \in C H^{*}\left(X^{\prime}\right) / 2
$$

Proof. When $\ell=8$, we see that elements

$$
c_{3}^{\prime} c_{5}^{\prime} c_{6}^{\prime} c_{7}^{\prime}=2^{4} y_{6} y_{10} y_{12} y_{14}=2^{4} y_{\text {top }}^{\prime} \quad \text { and } \quad c_{3}^{\prime} c_{4}^{\prime} c_{6}^{\prime} c_{7}^{\prime}=2^{3} v_{1} y_{\text {top }}^{\prime}
$$

are $B P^{*}$-module generators in $B P^{*}(G / T) /\left(I_{\infty} \cdot \operatorname{Im}\left(\operatorname{res}_{\Omega}\right)\right)$. Hence these elements are nonzero in $C H^{*}\left(X^{\prime}\right) / 2$ for $\ell=8$. We get cases $\ell \geq 8$ from the map $\operatorname{Spin}(17) \rightarrow \operatorname{Spin}(2 \ell+$ 1).

## 9. The exceptional group $E_{8}$ and $p=5$.

In this section, we consider the case $(G, p)=\left(E_{8}, 5\right)$. The similar arguments also hold for $(G, p)=\left(G_{2}, 2\right),\left(F_{4}, 3\right)$. The $\bmod (5)$ cohomology of $G=E_{8}([\mathbf{M i}-T o d])$ is given by

Theorem 9.1. The $\bmod (5)$ cohomology $H^{*}\left(E_{8} ; \mathbb{Z} / 5\right)$ is isomorphic to

$$
\mathbb{Z} / 5\left[y_{12}\right] /\left(y_{12}^{5}\right) \otimes \Lambda\left(z_{3}, z_{11}, z_{15}, z_{23}, z_{27}, z_{35}, z_{39}, z_{47}\right)
$$

where suffix means its degree. The cohomology operations are given

$$
\begin{array}{rlll}
\beta\left(z_{11}\right)=y_{12}, & \beta\left(z_{23}\right)=y_{12}^{2}, & \beta\left(z_{35}\right)=y_{12}^{3}, & \beta\left(z_{47}\right)=y_{12}^{4} \\
P^{1} z_{3}=z_{11}, & P^{1} z_{15}=z_{23}, & P^{1} z_{27}=z_{35}, & P^{1} z_{39}=z_{47} .
\end{array}
$$

We use the notation such that $y=y_{12}$ and $x_{1}=z_{3}, \ldots, x_{8}=z_{47}$ as used in Section 2. Hence we can rewrite the cohomology as

$$
H^{*}(G ; \mathbb{Z} / p) \cong \mathbb{Z} / p[y] /\left(y^{p}\right) \otimes \Lambda\left(x_{1}, \ldots, x_{2 p-2}\right)
$$

for $(G, p)=\left(E_{8}, 5\right)$. The above isomorphism also holds for $(G, p)=\left(G_{2}, 2\right),\left(F_{4}, 3\right)$. So hereafter in this section, we assume $(G, p)$ is one of $\left(G_{2}, 2\right),\left(F_{4}, 3\right)$ or $\left(E_{8}, 5\right)$. The cohomology operations are given as

$$
\beta: x_{2 i} \mapsto y^{i}, \quad P^{1}: x_{2 i-1} \mapsto x_{2 i} \quad \text { for } \quad 1 \leq i \leq p-1
$$

Hence the $Q_{i}$ operations are given

$$
Q_{1}\left(x_{2 i-1}\right)=Q_{0}\left(x_{2 i}\right)=y^{i} \quad \text { for } \quad 1 \leq i \leq p-1 .
$$

Therefore we have the following lemma, by using Lemma 3.1 or Corollary 3.2.
Lemma 9.2. In $B P^{*}(G / T) / I_{\infty}^{2}$, we have

$$
\begin{array}{cl}
p y^{i}=b_{2 i} & \bmod \left(b_{2}, b_{4}, \ldots, b_{2 i-2}\right), \\
v_{1} y^{i}=b_{2 i-1} & \bmod \left(b_{1}, b_{2}, \ldots, b_{2 i-2}\right) .
\end{array}
$$

Proof. First note that $Q_{0} x_{2 i}=y^{i}$ and $d_{r}\left(x_{2 i}\right)=b_{2 i}$. From Corollary 3.2, there is $y(2 i) \in B P^{*}(G / T) / I_{\infty}^{2}$ such that $p y(2 i)=b_{2 i}$ and $\pi^{*}(y(2 i))=y^{i}$, that is

$$
y(2 i)=y^{i}+\sum_{j<i} y^{j} t(j)
$$

where $t(j) \in S(t)|t(j)| \geq 2$. By induction on $i$, we get the first equation.
From $Q_{1}\left(x_{2 i-1}\right)=y^{i}$ and $d_{r^{\prime}}\left(x_{2 i-1}\right)=b_{2 i-1}$, there is $y(2 i-1)$ such that $v_{1} y(2 i-1)=$ $b_{2 i-1}$ and $\pi^{*}(y(2 i-1))=y^{i}$. Hence we get the second equation similarly.

The fundamental class is written $y^{p-1} t_{t o p} \in H^{*}(G / T)$, i.e., $y_{t o p}=y^{p-1}$. Since $p y^{p-1}=b_{2 p-2} \in S(t)$, we see $t(G)_{(p)}=p$.

By Petrov-Semenov-Zainoulline, it is known when $G$ is one of $\left(G_{2}, 2\right),\left(F_{4}, 3\right)$ or ( $E_{8}, 5$ ), the motive $R\left(\mathbb{G}_{k}\right)$ in Theorem 4.2 is just the original Rost motive $R_{2}$ defined by Rost and Voevodsky. (Recall Theorem 4.6.) The restriction $\operatorname{res}_{\Omega \mid R}: \Omega^{*}\left(R\left(\mathbb{G}_{k}\right)\right) \rightarrow$ $\Omega^{*}\left(\bar{R}\left(\mathbb{G}_{k}\right)\right)$ is injective. Hence the following restriction is also injective

$$
\operatorname{res}_{\Omega}: \Omega^{*}(X) \rightarrow \Omega^{*}(\bar{X}) \cong B P^{*}(G / T)
$$

Corollary 9.3. We see

$$
C H^{*}\left(R_{2}\right) / p \cong C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / p \cong \mathbb{Z} / p\left\{1, b_{1}, \ldots, b_{2 p-2}\right\} .
$$

In particular, $b_{s} \neq 0 \in C H^{*}(X) / p$. Moreover for $1 \leq s, r \leq 2 p-2$, we see $b_{s} b_{r}=0$ in $C H^{*}(X) / p$.

Proof. Recall Corollary 5.3. We will prove $b_{1} \neq 0 \in C H^{*}(X)$. Other cases are proved similarly. Note $b_{1}=v_{1} y \in \Omega^{*}(\bar{X})$. If $b_{1} \in B P^{<0} \cdot \operatorname{Im}\left(\operatorname{res}_{\Omega}\right)$, then $y \in \operatorname{Im}\left(\operatorname{res}_{\Omega}\right)$ and this is a contradiction. So $b_{1} \neq 0$ in

$$
C H^{*}(X) \cong \Omega^{*}(X) /\left(B P^{<0} \cdot \Omega^{*}(X)\right) \cong \operatorname{Im}\left(\operatorname{res}_{\Omega}\right) /\left(B P^{<0} \cdot \operatorname{Im}\left(\operatorname{res}_{\Omega}\right)\right)
$$

For the last isomorphism, we used the injectivity of res $\Omega_{\Omega}$. We prove $b_{1}^{2}=0 \in$ $C H^{*}(X)$. We see

$$
b_{1}^{2}=\left(v_{1} y\right)^{2}=v_{1}^{2} y^{2}=v_{1} b_{3} \in B P^{*}(G / T)
$$

This element is contained in $B P^{<0} \cdot \operatorname{Im}\left(\operatorname{res}_{\Omega}\right)$. Hence $b_{1}^{2}$ is zero in $C H^{*}(X)$ as above. The other cases can be proved similarly.

Theorem 9.4. Let $(G, p)=\left(G_{2}, 2\right),\left(F_{4}, 3\right)$ or $\left(E_{8}, 5\right)$, and let $X=\mathbb{G}_{k} / T_{k}$. Then there is an isomorphism

$$
C H^{*}(X) / p \cong S(t) /\left(p, b_{i} b_{j} \mid 1 \leq i, j \leq 2 p-2\right)
$$

Proof. From the preceding corollary we have the surjection

$$
S(t) /\left(p, b_{i} b_{j}\right) \rightarrow C H^{*}(X) / p
$$

On the other hand, it is immediate that there is an additive isomorphism

$$
S(t) /\left(p, b_{i} b_{j}\right) \cong \mathbb{Z} / p\left\{1, b_{1}, \ldots, b_{2 p-2}\right\} \otimes S(t) /(p, b)
$$

There is an injection from the above right hand side module into $\Omega^{*}(\bar{X}) /\left(B P^{<0}\right.$. $\operatorname{Im}\left(\operatorname{res} \Omega_{\Omega}\right)$ ). Hence we have the theorem.

Example. Let $G=F_{4}$ and $p=3$. We note $G^{\prime \prime}=\operatorname{Spin}(9) \subset G$ and

$$
H^{*}\left(B G^{\prime \prime}\right) / 3 \cong H^{*}\left(B T^{\prime \prime}\right)^{W^{\prime \prime}} / 3 \cong \mathbb{Z} / 3\left[p_{1}, \ldots, p_{4}\right]
$$

for the Pontryagin classes $p_{i}\left[\right.$ Tod1]. So $H^{*}\left(G^{\prime \prime} / T^{\prime \prime}\right) / 3 \cong S(t) /\left(3, p_{1}, \ldots, p_{4}\right)$. By using the induced map from $G^{\prime \prime} \subset G$, we can see $b_{i}=p_{i}$ in $C H^{*}(X) / 3$. Hence

$$
C H^{*}(X) / 3 \cong S(t) /\left(3, p_{i} p_{j} \mid 0 \leq i, j \leq 4\right)
$$

Let $G^{\prime}$ be of type $(I)$. Then it is well known ([Mi-Tod]) that there is a natural embedding $i: G \subset G^{\prime}$ where $(G, p)=\left(G_{2}, 2\right),\left(F_{4}, 3\right)$ or $\left(E_{8}, 5\right)$ such that $i^{*}: H^{*}\left(G^{\prime} ; \mathbb{Z} / p\right) \rightarrow H^{*}(G ; \mathbb{Z} / p)$ is surjective. Moreover the polynomial rings $P(y)$ and
$P(y)^{\prime}$ are isomorphic by this map $i^{*}$. This means $C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}\right)\right) \cong C H^{*}\left(\bar{R}\left(\mathbb{G}_{k}^{\prime}\right)\right)$. This fact implies

$$
C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) \cong C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right)
$$

from a theorem by Vishik and Zainoulline (Corollary 6 in [Vi-Za]). Thus we have
Corollary 9.5. Let $G^{\prime}$ be of type (I). Then there are isomorphisms

$$
\begin{gathered}
C H^{*}\left(R\left(\mathbb{G}_{k}^{\prime}\right)\right) / p \cong \mathbb{Z} / p\left\{1, b_{1}, \ldots, b_{2 p-2}\right\} \\
C H^{*}\left(X^{\prime}\right) / p \cong S(t) /\left(p, b_{i} b_{j}, b_{k} \mid 1 \leq i, j \leq 2 p-2,2 p-1 \leq k \leq \ell\right) .
\end{gathered}
$$

Proof. We only need to show that for $2 p-1 \leq k$, we can take $b_{k}$ such that $b_{k}=0 \in C H^{*}\left(X^{\prime}\right) / p$. Since $b_{k}=0$ in $B P^{*}(G / T) / I_{\infty} \cong H^{*}(G / T) / p$, in $B P^{*}(G / T) / I_{\infty}^{2}$, we can write

$$
b_{k}=\sum p y^{i} t(i)+\sum v_{1} y^{i} t(i)^{\prime}
$$

where $t(i), t(i)^{\prime} \in B P^{*} \otimes S(t)$. Take new $b_{k}$ by $b_{k}-\sum b_{2 i} t(i)-\sum b_{2 i-1} t(i)^{\prime}$. Then $b_{k}=0$ in $B P^{*}(G / T) / I_{\infty}^{2}$.

Example. Recall the case $\left(G^{\prime}, p\right)=(\operatorname{Spin}(7), 2)$ and $(G, p)=\left(G_{2}, 2\right)$. Then we can take $b_{1}=c_{2}^{\prime}, b_{2}=c_{3}^{\prime}$, and $b_{3}=c_{1}^{4}$, in fact

$$
C H^{*}\left(X^{\prime}\right) / 2 \cong S(t) /\left(\left(c_{2}^{\prime}\right)^{2}, c_{2}^{\prime} c_{3}^{\prime},\left(c_{3}^{\prime}\right)^{2}, c_{1}^{4}\right), \quad C H^{*}(X) / 2 \cong C H^{*}\left(X^{\prime}\right) /\left(c_{1}\right)
$$

## 10. The case $G=E_{8}$ and $p=3$.

In this section, we study the case $(G, p)=\left(E_{8}, p=3\right)$. The cohomology $H^{*}\left(E_{8} ; \mathbb{Z} / 3\right)$ is isomorphic to ([Mi-Tod])

$$
\mathbb{Z} / 3\left[y_{8}, y_{20}\right] /\left(y_{8}^{3}, y_{20}^{3}\right) \otimes \Lambda\left(z_{3}, z_{7}, z_{15}, z_{19}, z_{27}, z_{35}, z_{39}, z_{47}\right) .
$$

Here the suffix means its degree, e.g., $\left|z_{i}\right|=i$. By Kono-Mimura $[\mathbf{K o}-\mathbf{M i}]$ the actions of cohomology operations are also known.

Theorem $10.1([\mathbf{K o}-\mathbf{M i}])$. We have $P^{3} y_{8}=y_{20}$, and

$$
\begin{gathered}
\beta: z_{7} \mapsto y_{8}, \quad z_{15} \mapsto y_{8}^{2}, \quad z_{19} \mapsto y_{20}, \quad z_{27} \mapsto y_{8} y_{20}, \\
z_{35} \mapsto y_{8}^{2} y_{20}, \quad z_{39} \mapsto y_{20}^{2}, \quad z_{47} \mapsto y_{8} y_{20}^{2}, \\
P^{1}: z_{3} \mapsto z_{7}, \quad z_{15} \mapsto z_{19}, \quad z_{35} \mapsto z_{39}, \\
P^{3}: z_{7} \mapsto z_{19}, \quad z_{15} \mapsto z_{27} \mapsto-z_{39}, \quad z_{35} \mapsto z_{47} .
\end{gathered}
$$

We use notations $y=y_{8}, y^{\prime}=y_{20}$, and $x_{1}=z_{3}, \ldots, x_{8}=z_{47}$. Then we can rewrite the isomorphisms

$$
H^{*}(G ; \mathbb{Z} / 3) \cong \mathbb{Z} / 3\left[y, y^{\prime}\right] /\left(y^{3},\left(y^{\prime}\right)^{3}\right) \otimes \Lambda\left(x_{1}, \ldots, x_{8}\right)
$$

$$
\operatorname{gr} H^{*}(G / T ; \mathbb{Z} / 3) \cong \mathbb{Z} / 3\left[y, y^{\prime}\right] /\left(y^{3},\left(y^{\prime}\right)^{3}\right) \otimes S(t) /\left(b_{1}, \ldots, b_{8}\right)
$$

From Lemma 3.4, we have
Corollary 10.2. We can take $b_{1} \in B P^{*}(B T)$ such that in $B P^{*}(G / T) / I_{\infty}^{2}$,

$$
v_{1} y+v_{2} y^{\prime}=b_{1} .
$$

From the preceding theorem, we know that all $y^{i}\left(y^{\prime}\right)^{j}$ except for $(i, j)=(2,2)$ are $\beta$-image. Hence we have

Corollary 10.3. For all nonzero monomials $u \in P(y) / 3$ except for $\left(y y^{\prime}\right)^{2}$, it holds $3 u \in S(t)$. That is, for $2 \leq k=i+3 j+1 \leq 8,0 \leq i \leq 2$, we can take in $H^{*}(G / T) /\left(3^{2}\right)$

$$
b_{k}=b_{i+3 j+1}=3 y^{i}\left(y^{\prime}\right)^{j}
$$

Lemma 10.4. $\operatorname{Let}(G, p)=\left(E_{8}, 3\right)$ and $X=\mathbb{G}_{k} / T_{k}$. In $B P^{*}(X)$, there are $b_{i} \in S(t)$ such that $b_{i} \neq 0 \in C H^{*}(X) / 3$ and in $B P^{*}(G / T) / I_{\infty}^{2}$

$$
b_{k}=b_{i+3 j+1}= \begin{cases}v_{1} y+v_{2} y^{\prime} & \text { if } k=1 \\ 3 y^{i}\left(y^{\prime}\right)^{j} & \text { if } 0 \leq i \leq 1,2 \leq k \\ 3 y^{2}\left(y^{\prime}\right)^{j}+v_{1}\left(y^{\prime}\right)^{j+1} & \text { if } i=2 .\end{cases}
$$

Proof. Applying $r_{\Delta_{1}}$ to the equation $v_{1} y+v_{2} y^{\prime}=b_{1}$ in $B P^{*}(X) / I_{\infty}^{2}$, we have

$$
3 y+v_{1} r_{\Delta_{1}}(y)+v_{2} r_{\Delta_{1}}\left(y^{\prime}\right)=r_{\Delta_{1}}\left(b_{1}\right) .
$$

Note $P^{1}(y), P^{1}\left(y^{\prime}\right) \in S(t) / 3$ in $H^{*}(G / T ; \mathbb{Z} / 3)$ since they are primitive. Hence $v_{1} r_{\Delta_{1}}(y), v_{2} r_{\Delta_{1}}\left(y^{\prime}\right) \in B P^{*} \otimes S(t) \bmod \left(I_{\infty}^{2}\right)$. So we have $3 y=b_{2}$ in $B P^{*}(G / T) / I_{\infty}^{2}$. Applying $r_{3 \Delta_{1}}$ to the equation $3 y=b_{2} \in B P^{*}(X) / I_{\infty}^{2}$, we have $3 y^{\prime}=r_{3 \Delta_{1}}\left(b_{2}\right)$, which is written by $b_{3}$.

Next we study the element $3 y^{2}$ in $B P^{*}(X) / I_{\infty}^{2}$. Since $3 y^{2}=b_{3}$ in $H^{*}(X) /(9)$, we have in $B P^{*}(X) / I_{\infty}^{2}$

$$
3 y^{2}+v_{1}\left(a_{1}\right)+v_{2}\left(a_{2}\right)=b_{3} .
$$

We can take $a_{1}=y^{\prime}$ by using $Q_{1}\left(x_{3}\right)=y^{\prime}$ and the relation $v_{1} y+v_{2} y^{\prime}=b_{1}$. (For example, when $a_{1}=y^{\prime}+y b$, we use $v_{1} y b=-v_{2} y^{\prime}$ b.) Since $v_{2} a_{2}$ is primitive in $k(2)^{*}(G / T) /\left(I_{\infty}^{2}\right)$ (Recall the proof of Lemma 3.4), we can take $a_{2}=0$. Otherwise if $a_{2}=\sum y^{i}\left(y^{\prime}\right)^{j} b$, for $i=1,2$, then

$$
v_{2} y^{i} \otimes\left(y^{\prime}\right)^{j} b \neq 0 \in k(2)^{*}(G) \otimes_{k(2)^{*}} k(2)^{*}(G / T)
$$

Hence we get $3 y^{2}+v_{1} y^{\prime}=b_{3}$ in $B P^{*}(X) / I_{\infty}^{2}$.
Applying $r_{3 \Delta_{1}}$ and $r_{6 \Delta_{1}}$ to the above equation, we have the formulas for $y y^{\prime}$ and $\left(y^{\prime}\right)^{2}$. Here we used that $r_{3 \Delta_{1}}(y)=y^{\prime}$, and $r_{n \Delta_{1}}\left(y^{\prime}\right) \in B P^{*}(B T) /\left(I_{\infty}^{2}\right)$ since it is primitive. Similar arguments work for the element $y^{2} y^{\prime}$, and we can get the formula for $y\left(y^{\prime}\right)^{2}$.

Corollary 10.5. The torsion index $t\left(E_{8}\right)_{(3)}=3^{2}$.
Proof. The fundamental class $f$ (localized at 3 ) is given by $f=y_{\text {top }} t=y^{2}\left(y^{\prime}\right)^{2} t$ for $t=t_{\text {top }} \in S(t)$. Since $b_{2} b_{8}=(3 y)\left(3 y\left(y^{\prime}\right)^{2}\right)=3^{2} y_{\text {top }} \in S(t)$, we see $t\left(E_{8}\right)_{(3)}=3$ or $3^{2}$.

Suppose $t\left(E_{8}\right)_{(3)}=3$, namely, $3 y^{2}\left(y^{\prime}\right)^{2}=b^{\prime} \in S(t)$. From Lemma 3.1, this implies that there is $x \in H^{*}(G ; \mathbb{Z} / 3)$ such that $Q_{0}(x)=y^{2}\left(y^{\prime}\right)^{2}$ and $d_{r}(x)=b^{\prime}$. But such $x$ does not exist from Theorem 10.2.

Recall that $A_{N}=\mathbb{Z} / 3\left\{b_{i_{1}} \cdots b_{i_{s}}| | b_{i_{1}}\left|+\cdots+\left|b_{i_{s}}\right| \leq N\right\}\right.$. From Lemma 5.4, we have the surjection $A_{M} \otimes S(t) /(b) \rightarrow C H^{*}(X) / 3$ for $M=\left|\left(y y^{\prime}\right)^{2}\right|=56$.

Theorem 10.6. Let $(G, p)=\left(E_{8}, 3\right)$ and $\mathbb{G}_{k}$ is a versal $G_{k}$-torsor. Then we have surjective maps

$$
A_{56} \rightarrow C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 3 \rightarrow \mathbb{Z} / 3\left\{1, b_{1}, \ldots, b_{8}, b_{1} b_{6}, b_{1} b_{8}, b_{2} b_{8}\right\},
$$

Proof. Since $t\left(E_{8}\right)_{(3)}=3^{2}$ and $X$ is a versal flag variety, we see $3\left(y y^{\prime}\right)^{2} f \notin \operatorname{res}_{\mathrm{CH}}$. It follows $3\left(y y^{\prime}\right)^{2} \notin \operatorname{res}_{\mathrm{CH}}$. Therefore $9\left(y y^{\prime}\right)^{2}, 3 v_{1}\left(y y^{\prime}\right)^{2}, 3 v_{2}\left(y y^{\prime}\right)^{2}$ are $B P^{*}$-module generators in $\operatorname{Res}_{\Omega}=\operatorname{Im}\left(\operatorname{res}_{\Omega}\right)$. Since the restriction $\operatorname{res}_{\Omega}$ is written as

$$
\left(b_{2} b_{8}\right) \mapsto 9\left(y y^{\prime}\right)^{2}, \quad\left(b_{1} b_{8}\right) \mapsto 3 v_{1}\left(y y^{\prime}\right)^{2}, \quad\left(b_{1} b_{6}\right) \mapsto 3 v_{2}\left(y y^{\prime}\right)^{2},
$$

we have the theorem.
Corollary 10.7. Let Tor $\subset C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right)$ be the module of torsion elements. Then we have the isomorphism

$$
\left(C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / \text { Tor }\right) \otimes \mathbb{Z} / 3 \cong \mathbb{Z} / 3\left\{1, b_{2}, \ldots, b_{8}, b_{2} b_{8}\right\}
$$

Proof. Let us write by $b_{i}=p y_{(i)}$ for $i \geq 2$. Let $y_{(i)} y_{(j)} \neq y^{2}\left(y^{\prime}\right)^{2}$. Then there is $k$ such that $y_{(i)} y_{(j)}=y_{(k)}$. Hence $b_{i} b_{j}=3 b_{k}$ in $C H^{*}(\bar{X})$. So $b_{i} b_{j}-3 b_{k}$ is a torsion element because $\operatorname{res}_{\mathrm{CH}} \otimes \mathbb{Q}$ is isomorphic.

We recall that there is an embedding $F_{4} \subset E_{8}$. Let $K / k$ be a field extension of degree $3 a$ with $(3, a)=1$ such that the flag variety $\left.X\right|_{K}=\left.\left(\mathbb{G}_{k} / T_{k}\right)\right|_{K}$ is still twisted but $\left.X\right|_{K^{\prime}}$ is split for an extension $K^{\prime} / K$ of degree $3 a^{\prime}$ with $\left(3, a^{\prime}\right)=1$. Note $P^{3} y=y^{\prime}$ and if $y \in \operatorname{res}_{\mathrm{K}}^{\overline{\mathrm{K}}}$, then so is $y^{\prime}$. Since $\left.X\right|_{K}$ is twisted, we see $y^{\prime} \in \operatorname{res}_{\mathrm{K}}^{\overline{\mathrm{K}}}$ but $y$ is not. Hence the $J$-invariants are

$$
J\left(\mathbb{G}_{K}\right)=(1,0) \quad \text { but } \quad J\left(\mathbb{G}_{k}\right)=(1,1) .
$$

(See also 4.1.3 in $\left[\mathbf{P e - S e - Z a ] , ~}[\mathbf{S e}]\right.$ for $E_{8}, 1 \geq j_{1} \geq j_{2}$ ).
We know that the generalized Rost motive for $F_{4}$ and $p=3$ is just the original Rost motive $R_{2}$. Hence the natural map $i: F_{4} \rightarrow E_{8}$ induces the isomorphism of Chow groups over $\bar{K}$ of $R_{2}$ and $R\left(\mathbb{G}_{K}\right)$. By Vishik-Zainoulline ( $\left.[\mathbf{V i - Z a}]\right)$, we have the isomorphism

$$
C H^{*}\left(R_{2}\right) / 3 \cong C H^{*}\left(R\left(\mathbb{G}_{K}\right)\right) / 3
$$

Proposition 10.8. Let us write the restriction map $\operatorname{res}_{k}^{K}$

$$
C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 3 \rightarrow C H^{*}\left(\left.R\left(\mathbb{G}_{k}\right)\right|_{K}\right) / 3 \cong C H^{*}\left(R_{2}\right) \otimes \mathbb{Z} / 3\left[y^{\prime}\right] /\left(\left(y^{\prime}\right)^{3}\right)
$$

Then we have $\operatorname{Im}\left(\operatorname{res}_{k}^{K}\right) \cong \mathbb{Z} / 3\left\{1, b_{1}, b_{2}, b_{3}, b_{5}, b_{6}, b_{8}\right\}$.
Proof. This proposition is proved by considering the restriction on $\Omega^{*}(\bar{X})$. For example, $b_{8}=3 y\left(y^{\prime}\right)^{2} \neq 0$ in $C H^{*}\left(\left.X\right|_{K}\right) / 3$, but $b_{2} b_{8}=3 \cdot(3 y)\left(y^{\prime}\right)^{2}=0$. In particular, we use the fact that $b_{4}=3 y^{\prime}, b_{7}=3\left(y^{\prime}\right)^{2}$ are in $\operatorname{Ker}\left(\operatorname{res}_{\mathrm{k}}^{\mathrm{K}}\right)$.

## 11. The case $G=E_{8}$ and $p=2$.

In this section, we consider the case $(G, p)=\left(E_{8}, 2\right)$. The mod (2) cohomology $H^{*}\left(E_{8} ; \mathbb{Z} / 2\right)$ is given $[\mathbf{M i}-\mathbf{T o d}]$ as

$$
\mathbb{Z} / 2\left[z_{3}, z_{5}, z_{9}, x_{15}\right] /\left(z_{3}^{16}, z_{5}^{8}, z_{9}^{4}, z_{15}^{4}\right) \otimes \Lambda\left(z_{17}, z_{23}, z_{27}, z_{29}\right)
$$

Here we consider a graded algebra $\operatorname{gr} H^{*}\left(E_{8} ; Z / 2\right)$ identifying $y_{2 i}=z_{i}^{2}$ for $i=3,5,9,15$.
Theorem 11.1. The cohomology $\operatorname{gr} H^{*}\left(E_{8} ; \mathbb{Z} / 2\right)$ is given

$$
\mathbb{Z} / 2\left[y_{6}, y_{10}, y_{18}, y_{30}\right] /\left(y_{6}^{8}, y_{10}^{4}, y_{18}^{2}, y_{30}^{2}\right) \otimes \Lambda\left(z_{3}, z_{5}, z_{9}, z_{15}, z_{17}, z_{23}, z_{27}, z_{29}\right) .
$$

Let us write $y_{1}=y_{6}, \ldots, y_{4}=y_{30}$ and $x_{1}=z_{3}, x_{2}=z_{5}, \ldots, x_{8}=z_{29}$. For ease of argument, let $x_{4}=z_{17}$ and $x_{5}=z_{15}$. Hence we can write

$$
g r H^{*}\left(E_{8} ; \mathbb{Z} / 2\right) \cong \mathbb{Z} / 2\left[y_{1}, y_{2}, y_{3}, y_{4}\right] /\left(y_{1}^{8}, y_{2}^{4}, y_{3}^{2}, y_{4}^{2}\right) \otimes \Lambda\left(x_{1}, \ldots, x_{8}\right)
$$

Lemma 11.2. The cohomology operations acts as

$$
\begin{aligned}
& x_{1}=z_{3} \xrightarrow{S q^{2}} x_{2}=z_{5} \xrightarrow{S q^{4}} x_{3}=z_{9} \xrightarrow{S q^{8}} x_{4}=z_{17} \\
& x_{5}=z_{15} \xrightarrow{S q^{8}} x_{6}=z_{23} \xrightarrow{S q^{4}} x_{7}=z_{27} \xrightarrow{S q^{2}} x_{8}=z_{29} \\
& x_{5}=z_{15} \xrightarrow{S q^{2}} x_{4}=z_{17} .
\end{aligned}
$$

The Bockstein acts $S q^{1}\left(x_{i+1}\right)=y_{i}$ for $1 \leq i \leq 3, S q^{1}\left(x_{8}\right)=y_{4}$ and

$$
S q^{1}: x_{5}=z_{15} \mapsto y_{1} y_{2}, \quad x_{6}=z_{23} \mapsto y_{1} y_{3}+y_{1}^{4}, \quad x_{7}=z_{27} \mapsto y_{2} y_{3} .
$$

Then we see from Lemma 3.4
Corollary 11.3. In $B P^{*}(X) / I_{\infty}^{2}$, we can take $y_{1}$ such that for $r_{2 \Delta_{1}}\left(y_{1}\right)=y_{2}$ and $r_{4 \Delta_{1}}\left(y_{2}\right)=y_{3}$, we have for $b_{1} \in B P^{*}(B T)$

$$
v_{1} y_{1}+v_{2} y_{2}+v_{3} y_{3}=b_{1}
$$

From Lemma 3.1 and the $S q^{1}$ action in Lemma 11.2, it is immediate that
Lemma 11.4. Let $(G, p)=\left(E_{8}, 2\right)$ and $X=\mathbb{G}_{k} / T_{k}$. In $H^{*}(X) /(4)$, there are
$b_{i} \in S(t)$ such that

$$
b_{i}= \begin{cases}2 y(1)(\text { resp. } 2 y(2), 2 y(3)) & \text { if } k=2(\text { resp. } k=3,4) \\ 2 y(1,2)(\text { resp. } 2 y(1,3), 2 y(2,3)) & \text { if } k=5(\text { resp. } k=6,7) \\ 2 y(4) & \text { if } k=8,\end{cases}
$$

where $\pi^{*} y(i)=y_{i}, \pi^{*} y(i, j)=y_{i} y_{j}$ for the map $\pi: G \rightarrow G / T$.
We will study $b_{i}$ by using the Quillen operation $r_{\alpha}$. In particular recall $\rho r_{\alpha}(x)=$ $\chi P^{\alpha}(\rho(x))$ for $\rho: B P^{*}(X) \rightarrow H^{*}(X ; \mathbb{Z} / 2)$. The anti-automorphism $\chi$ is defined by

$$
\chi\left(S q^{0}\right)=S q^{0}, \quad \sum_{i} S q^{i} \chi\left(S q^{n-i}\right)=0 \quad \text { for } n>0
$$

For example, $\left(\right.$ when $\left.S q^{1}=0\right) \chi\left(P^{i}\right)=P^{i}$ for $i=1,2$ and $\chi\left(P^{3}\right)=P^{2} P^{1},\left(P^{3}=P^{1} P^{2}\right)$, and $\chi\left(P^{4}\right)=P^{4}+P^{2} P^{2}$.

Lemma 11.5. In $B P^{*}(X) / I_{\infty}^{2}$, we have

$$
b_{i}= \begin{cases}2 y_{1}+v_{2}\left(y_{1}^{2}\right)+v_{3}\left(y_{2}^{2}\right) & \text { if } i=2 \\ 2 y_{2}+v_{1}\left(y_{1}^{2}\right)+v_{3}\left(y_{1}^{4}\right) & \text { if } i=3 \\ 2 y_{3}+v_{1}\left(y_{2}^{2}\right) & \text { if } i=4 .\end{cases}
$$

Proof. Applying the operation $r_{\Delta_{1}}$ to the equation $v_{1} y_{1}+v_{2} y_{2}+v_{3} y_{3}=b_{1}$, we get

$$
2 y_{1}+v_{1} r_{\Delta_{1}}\left(y_{1}\right)+v_{2} r_{\Delta_{1}}\left(y_{2}\right)+v_{3} r_{\Delta_{1}}\left(y_{3}\right)=r_{\Delta_{1}}\left(b_{1}\right) .
$$

Recall that $P^{1}\left(y_{i}\right)$ are primitive in $H^{*}(G / T ; \mathbb{Z} / 2)$. In fact, by Kono-Ishitoya, we know (Theorem 5.9 in [Ko-Is2])

$$
P^{1}\left(y_{1}\right) \in S(t), \quad P^{1}\left(y_{2}\right)=y_{1}^{2}, \quad P^{1}\left(y_{3}\right)=y_{2}^{2} .
$$

Thus we have $2 y_{1}+v_{2}\left(y_{1}^{2}\right)+v_{3}\left(y_{2}^{2}\right)=b_{2}$. (Note also $Q_{2}\left(x_{2}\right)=y_{1}^{2}, Q_{3}\left(x_{2}\right)=y_{2}^{2}$.)
Applying $r_{2 \Delta_{1}}$ to this formula, we have

$$
\begin{aligned}
b_{3} & =2 y_{2}+v_{1}\left(y_{1}^{2}\right)+v_{2}\left(r_{\Delta_{1}}\left(y_{1}\right)^{2}\right)+v_{3}\left(r_{\Delta_{1}}\left(y_{2}\right)^{2}\right) \\
& =2 y_{2}+v_{1}\left(y_{1}^{2}\right)+v_{3}\left(y_{1}^{4}\right) .
\end{aligned}
$$

Applying $r_{4 \Delta_{1}}$, we have $b_{4}=2 y_{3}+v_{1} y_{2}^{2}$ where we used $P^{2}\left(y_{1}\right)=y_{2}$.
From Lemma 3.1, we see that

$$
b_{5}=2 y(1,2)=2\left(y_{1} y_{2}+\lambda y_{1}^{2} b^{\prime}\right)
$$

where $\lambda \in \mathbb{Z} / 2, b, b^{\prime} \in S(t)$. However, stronger results are known by Nakagawa $[\mathrm{Na}]$ and Totaro [To1].

Lemma 11.6 ( $[\mathbf{N a}]$, [To1]). In $H^{*}(G / T) / 4$, we see $2 y_{1} y_{2} \in S(t)$. Indeed, in the notation in $[\mathbf{T o 1}] d_{8}=1 / 9 d_{4}^{2}-2 / 3 g_{3} g_{5}$ where $g_{3}=y_{1}, g_{5}=y_{2}$ and $d_{i} \in S(t)$.

Lemma 11.7. In $B P^{*}(G / T) /\left(I_{\infty}^{2}\right)$, we have, for some $b^{\prime}, b^{\prime \prime} \in S(t)$

$$
b_{5}=2 y_{1} y_{2}+v_{1}\left(y_{3}\right)+v_{2}\left(y_{2} b^{\prime}+y_{2}^{2} b^{\prime \prime}\right)+v_{3}\left(y_{4}\right) .
$$

Proof. From the preceding lemma, we can write in $B P^{*}(G / T) /\left(v_{3}, I_{\infty}^{2}\right)$,

$$
b_{5}=2 y_{1} y_{2}+v_{1}\left(a_{1}\right)+v_{2}\left(a_{2}\right)+v_{3}\left(a_{3}\right) .
$$

We may assume that $a_{1}$ does not contain $y_{1}$ by using the relation $b_{1}=v_{1} y_{1}+\cdots$. Note that in $k(i)^{*}(G / T) / I_{\infty}^{2}$, each $v_{i} a_{i}$ is primitive. Since $y_{2}$ is not in $Q_{1}$-image in $H^{*}(G ; \mathbb{Z} / 2)$, we see $y_{2}$ is $v_{1}$-torsion free in $k(1)^{*}(G)$. So if $a_{1}$ contains $y_{2}$, then $v_{1} a_{1}$ is not primitive in $k(1)^{*}(G)$, which is a contradiction. (E.g., if $a_{1}=y_{2} y$, then $\mu^{*}\left(v_{1} a_{1}\right)=v_{1} y_{2} \otimes y+\cdots$.) So $a_{1}$ contains only $y_{3}$, indeed $Q_{1} x_{5}=y_{3}$ implies $a_{1}=y_{3}$.

For $a_{2}$, we know that $y_{1}, y_{3}$ are not $v_{2}$-torsion. Therefore $a_{2}$ only contains $y_{2}$, that is,

$$
a_{2}=y_{2} b^{\prime}+y_{2}^{2} b^{\prime \prime} \quad \bmod \left(y_{2}^{2}\right) \text { for } b^{\prime}, b^{\prime \prime} \in S(t) .
$$

By the primitivity in $k(3)^{*}(G / T)$, the element $a_{3}$ only contains $y_{3}, y_{4}$. We know $Q_{3}\left(x_{5}\right)=$ $y_{4}$. If $a_{3}=v_{1}\left(y_{4}+y_{3} b^{\prime \prime}\right)$, then let new $y_{4}$ be the element $y_{4}+y_{3} b^{\prime \prime}$. Thus we have the result.

Lemma 11.8. In $B P^{*}(G / T) /\left(I_{\infty}^{2}, v_{2}, v_{3}\right)$, we have

$$
b_{6}=2\left(y_{1} y_{3}+y_{1}^{4}+y_{1}^{2} b^{\prime \prime \prime}\right) \quad \text { for } \quad b^{\prime \prime \prime} \in S(t)
$$

Proof. We apply $r_{4 \Delta_{1}}$ on $b_{5}$. By Cartan formula, we see

$$
r_{4 \Delta_{1}}\left(y_{1} y_{2}\right)=\sum_{i} r_{i \Delta_{1}}\left(y_{1}\right) r_{(4-i) \Delta_{1}}\left(y_{2}\right)
$$

Here $r_{3 \Delta_{1}}=\chi\left(P^{3}\right)=P^{2} P^{1} \bmod (2)$. Hence we have with $\bmod (2)$

$$
\begin{gathered}
r_{3 \Delta_{1}}\left(y_{1}\right) r_{\Delta_{1}}\left(y_{2}\right)=P^{2} P^{1}\left(y_{1}\right) P^{1}\left(y_{2}\right)=b y_{1}^{2}, \\
r_{2 \Delta_{1}}\left(y_{1}\right) r_{2 \Delta_{1}}\left(y_{2}\right)=y_{2} b^{\prime \prime}, \text { and } 2 y_{2} b^{\prime \prime} \in S(t), \\
r_{\Delta_{1}}\left(y_{1}\right) r_{3 \Delta}\left(y_{2}\right)=b^{\prime \prime} b^{\prime \prime \prime} \in S(t), \text { and } y_{1} r_{4 \Delta_{1}}\left(y_{2}\right)=y_{1} y_{3} .
\end{gathered}
$$

Hence $r_{4 \Delta_{1}}\left(y_{1} y_{2}\right)=y_{1} y_{3}+b y_{1}^{2} \bmod \left(B P^{*} \otimes S(t)\right)$.
Next consider

$$
r_{4 \Delta_{1}}\left(v_{1} y_{3}\right)=2 r_{3 \Delta}\left(y_{3}\right)+v_{1}\left(r_{4 \Delta_{1}}\left(y_{3}\right)\right) .
$$

Here with mod (2) we see

$$
r_{3 \Delta}\left(y_{3}\right)=P^{2} P^{1}\left(y_{3}\right)=P^{2}\left(y_{2}^{2}\right)=y_{1}^{4} .
$$

We also see $r_{4 \Delta_{1}}\left(y_{3}\right)=P^{4} y_{3} \in S(t)$ from the primitivity in $H^{*}(G / T ; \mathbb{Z} / 2)$.
At last we can see

$$
r_{4 \Delta_{1}} v_{2}\left(b^{\prime} y_{2}+b^{\prime \prime} y_{2}^{2}\right)=v_{1} r_{2 \Delta_{1}}\left(b^{\prime} y_{2}+b^{\prime \prime} y_{2}^{2}\right)=0 \quad \bmod \left(v_{2}\right) .
$$

Because if it contains $v_{1} y_{2}$ or $v_{1} y_{2}^{2}$, then it is not primitive in $k(1)^{*}(G / T)$, and this is a contradiction. If it contains $v_{1} y_{1}$, then it is in $\operatorname{Ideal}\left(v_{2}\right)$ by the relation $b_{1}$. Thus we have the result $\left(\operatorname{with} \bmod \left(v_{2}, v_{3}\right)\right)$ of this lemma.

Similarly considering $r_{2 \Delta}\left(b_{6}\right)$ and $Q_{1} x_{7}=y_{4}$, we have
Lemma 11.9. In $B P^{*}(G / T) /\left(I_{\infty}^{2}, v_{2}, v_{3}\right)$, we have $b_{7}=2\left(y_{2} y_{3}+b y_{1}^{2}+b^{\prime} y_{2}^{2}\right)+v_{1} y_{4}$.
Remark. For the preceding two lemmas, Totaro gets stronger and explicit results with $\bmod \left(v_{1}, v_{2}, \ldots\right)$. Totaro (Lemma 4.4 in [To1]) shows in $H^{*}(G / T)_{(2)}$

$$
d_{6}^{2}-25 / 81 d_{4}^{3}+2\left(15 g_{9} g_{3}+1 / 3 g_{3}^{4}-5 / 3 g_{5} d_{7}-125 / 9 g_{5} g_{3} d_{4}\right)+2^{2}\left(-23 / 3 g_{3}^{2} d_{6}\right)=0
$$

where $g_{3}=y_{1}, g_{5}=y_{2}, g_{9}=y_{3}$ and $d_{i} \in S(t)$. This implies $2\left(y_{1} y_{3}+y_{1}^{4}\right) \in S(t)$. Therefore we can take $b^{\prime \prime \prime}=0$ in Lemma 11.8. Totaro also gives explicit formula $d_{7}, d_{8}$ in $H^{*}(G / T)$. In particular, in Lemma 4.4 in [To1], he shows $b=b^{\prime}=0$ in the above lemma.

At last, from $\beta\left(x_{8}\right)=y_{4}$, we note
Lemma 11.10. In $H^{*}(G / T) / 4$, we see $2 y_{4}=b_{8}$.
Now we study the torsion index. Recall

$$
y_{t o p}=\Pi_{i=1}^{4} y_{i}^{2_{i}-1}=y_{1}^{7} y_{2}^{3} y_{3} y_{4} \in P(y)
$$

and $t_{\text {top }}$ are top degree elements in $P(y)$ and $S(t) /(b)$ so that $f=y_{\text {top }} t_{\text {top }}$ for the fundamental class $f$ of $H^{*}(G / T)_{(2)}$.

Lemma 11.11 (Totaro [To1]). We have $t\left(E_{8}\right)_{(2)}=2^{6}$.
Proof. We consider the element

$$
\tilde{b}=b_{5}^{3} b_{6} b_{4} b_{8}=2^{6}\left(y_{1} y_{2}\right)^{3}\left(y_{1} y_{3}+y_{1}^{4}+y_{1}^{2} b^{\prime \prime}\right)\left(y_{3}\right)\left(y_{4}\right)
$$

Here using $y_{3}^{2}=b^{\prime} \in S(t) \bmod (2)$, we have

$$
\left(y_{1} y_{3}+y_{1}^{4}+y_{1}^{2} b^{\prime \prime}\right) y_{3}=y_{1}^{4} y_{3}+\left(y_{1} b^{\prime}+y_{1}^{2} b^{\prime \prime}\right) y_{3} .
$$

Hence we can write

$$
\tilde{b}=2^{6}\left(y_{t o p}+\sum y t\right) \quad \text { for } \quad|t|>0
$$

From Lemma 5.5, we see $t\left(E_{8}\right)_{(2)} \leq 2^{6}$.
Suppose $t\left(E_{8}\right)_{(2)} \leq 2^{5}$, that is, $2^{5} f=2^{5} y_{\text {top }} t_{\text {top }} \in S(t)$. Then $2^{5} f$ must be in the ideal $I=\left(b_{1}, \ldots, b_{8}\right)$, and we can write for $b_{i}=2 y_{(i)}$ (note $y_{(1)}=0$, and $y_{(i)}$ is not a
monomial, in general)

$$
\text { (*) } \quad 2^{5} f=\sum b_{i} t(i)=2 \sum y_{(i)} t(i) \quad \text { for } t(i) \in S(t) .
$$

Since $H^{*}(G / T)$ has no torsion, we have $2^{4} f=\sum y_{(i)} t(i)$.
Let us rewrite $s=\sum y_{(i)} t(i)=\sum_{I} y^{I} t(I)$ for a monomial $y^{I}=y_{1}^{i_{1}} \cdots y_{4}^{i_{4}} \in P(y)$ for $I=\left(i_{1}, \ldots, i_{4}\right)$, and $t(I) \in S(t)$. Then $s \in \operatorname{Ideal}(2)$ implies each $t(I) \in \operatorname{Ideal}\left(b_{1}, \ldots, b_{8}\right) \subset$ $S(t)$, since $H^{*}(G / T) / 2 \cong P(y) \otimes S(t) /(b)$. Continue this argument, and then we have, in $H^{*}(G / T)$,

$$
(* *) \quad f=\sum y^{I} t(I) .
$$

Consider this equation in $H^{*}(G / T) / 2$, and we see $f=\sum y^{I} t(I)$, that is $y^{I}=y_{t o p}$ and $t(I)=t_{\text {top }}$.

To get $(* *)$ from $(*)$, we change $b_{i}$ to $2 y_{(i)}$ at most five times.
Let us write by $\sharp_{y}(s)$ the number of $y_{i}$ 's in $s$, namely, the largest number of $\left(i_{1}+\right.$ $\cdots+i_{4}$ ) for monomials $y_{I}$ in $s=\sum y_{I} t(I)$. For example,

$$
\sharp_{y}\left(y_{t o p}\right)=\sharp_{y}\left(y_{1}^{7} y_{2}^{3} y_{3} y_{4}\right)=7+3+1+1=12 .
$$

On the other hand, we note that $\sharp_{y}\left(y_{(j)}\right)$ is 1 or 2 except for

$$
\sharp_{y}\left(y_{(6)}\right)=\sharp_{y}\left(\left(y_{1} y_{3}+y_{1}^{4}+y_{1}^{2} b\right)\right)=4 \text {. }
$$

We easily see that $y_{(6)}$ appears as $y_{(i)}$ just one time in the process $(*)$ to $(* *)$. We also see that $y_{(i)}=y_{(8)}$ just one time for the existence of $y_{4}$. Hence

$$
\sharp_{y}\left(y_{\left(i_{1}\right)} \cdots y_{\left(i_{5}\right)}\right) \leq 2 \times 3+4+1=11 .
$$

This is a contradiction. Thus $t\left(E_{8}\right)_{2} \geq 2^{6}$.
Lemma 11.12. Let $\left(i_{1}, \ldots, i_{k}\right) \subset(4,5,5,5,6,8)$. Then $\tilde{b}=b_{i_{1}} \cdots b_{i_{k}} \neq 0$ in $C H^{*}(X) / 2$ since $b_{5}^{3} b_{4} b_{6} b_{8} \neq 0$.

Let $K$ be an extension of $k$ such that $X$ does not split over $K$ but splits over an extension over $K$ of degree $2 a,(2, a)=1$. Suppose that

$$
\text { (*) } \quad y_{1}, y_{2}, y_{3} \in \operatorname{Res}_{\mathrm{K}}, \quad \text { but } \quad y_{4} \notin \operatorname{Res}_{\mathrm{K}}
$$

where $\operatorname{Res}_{\mathrm{K}}=\operatorname{Im}\left(\right.$ res : $\left.C H^{*}\left(\left.X\right|_{K}\right) / 2 \rightarrow C H(\bar{X}) / 2\right)$. (Compare the above condition $(*)$ with the condition $(*)$ in Section 7.) That is, $J\left(\mathbb{G}_{K}\right)=(0,0,0,1)$ and such $K$ exists (see $[\mathbf{P e}-\mathrm{Se}-\mathrm{Za}],[\mathbf{S e}])$. Then we have the following theorem by arguments similar to those to get Theorem 7.12. (The motive $\left.R\left(\mathbb{G}_{k}\right)\right|_{K}$ in the theorem is an example of motives given in Lemma 8.4 in [Se].)

Theorem 11.13. There is an isomorphism

$$
C H^{*}\left(\left.R\left(\mathbb{G}_{k}\right)\right|_{K}\right) / 2 \cong \mathbb{Z} / 2\left[y_{1}, y_{2}, y_{3}\right] /\left(y_{1}^{8}, y_{2}^{4}, y_{3}^{2}\right) \otimes C H^{*}\left(R_{4}\right) / 2,
$$

where $C H^{*}\left(R_{4}\right) / 2 \cong \mathbb{Z} / 2\left\{1,2 y_{4}, v_{1} y_{4}, v_{2} y_{4}, v_{3} y_{4}\right\}$. We have

$$
\operatorname{Res}_{k}^{K}\left(C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2\right) \cong C H^{*}\left(R_{4}\right) / 2 \subset C H^{*}\left(\left.R\left(\mathbb{G}_{k}\right)\right|_{K}\right) / 2
$$

The restriction map is given as $b_{j} \mapsto v_{8-j} y_{4}$ if $5 \leq j \leq 8$, and $b_{j} \mapsto 0$ if $1 \leq j \leq 4$.

## 12. The exceptional group $E_{7}$ and $p=2$.

The $\bmod (2)$ cohomology of $E_{7}$ is given

$$
H^{*}\left(E_{7} ; \mathbb{Z} / 2\right) \cong H^{*}\left(E_{8} ; \mathbb{Z} / 2\right) /\left(z_{3}^{4}, z_{5}^{4}, z_{15}^{2}, z_{29}\right)
$$

We use the notations in the preceding sections.
Theorem 12.1. We have an isomorphism

$$
\operatorname{gr} H^{*}\left(E_{7} ; \mathbb{Z} / 2\right) \cong \mathbb{Z} / 2\left[y_{1}, y_{2}, y_{3}\right] /\left(y_{1}^{2}, y_{2}^{2}, y_{3}^{2}\right) \otimes \Lambda\left(x_{1}, \ldots, x_{7}\right)
$$

where $i^{*}\left(y_{j}\right)=y_{j}$ for $1 \leq j \leq 3$ and $i^{*}\left(x_{i}\right)=x_{i}$ for $1 \leq i \leq 7$ and $i^{*}\left(y_{4}\right)=i^{*}\left(x_{8}\right)=0$ for the natural embedding $i: E_{7} \subset E_{8}$.

Corollary 12.2. In $B P^{*}(X) / I_{\infty}^{2}$, we can take $y_{1}$ such that for $r_{2 \Delta_{1}}\left(y_{1}\right)=y_{2}$ and $r_{4 \Delta_{1}}\left(y_{2}\right)=y_{3}$, it holds $v_{1} y_{1}+v_{2} y_{2}+v_{3} y_{3}=b_{1}$ for $b_{1} \in B P^{*}(B T)$.

From Lemma 3.1 and the $S q^{1}$ action in Lemma 11.2, it is immediate.
Lemma 12.3. Let $(G, p)=\left(E_{7}, 2\right)$. In $H^{*}(G / T) /(4)$, for all monomials $u \in$ $P(y) / 2$, except for $y_{\text {top }}=y_{1} y_{2} y_{3}$, the elements $2 u$ are written as elements in $H^{*}(B T)$. Namely, in $H^{*}(G / T) /(4)$, there are $b_{i} \in S(t)$ such that

$$
b_{k}= \begin{cases}2 y_{1}\left(\text { resp. } 2 y_{2}, 2 y_{3}\right) & \text { if } k=2(\text { resp. } k=3,4) \\ 2 y_{1} y_{2}\left(\text { resp. } 2 y_{1} y_{3}, 2 y_{2} y_{3}\right) & \text { if } k=5(\text { resp. } k=6,7) .\end{cases}
$$

From Lemma 11.5, it is immediate.
Lemma 12.4. In $B P^{*}(X) / I_{\infty}^{2}$, we have $2 y_{1}=b_{2}, 2 y_{2}=b_{3}, 2 y_{3}=b_{4}$.
Lemma 12.5. We have $t\left(E_{7}\right)_{(2)}=2^{2}$.
Proof. We get the result from $b_{2} b_{7}=\left(2 y_{1}\right)\left(2 y_{2} y_{3}\right)=2^{2} y_{\text {top }}$.
Corollary 12.6. There are surjective maps

$$
A_{34} \rightarrow C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) / 2 \rightarrow \mathbb{Z} / 2\left\{1, b_{1}, \ldots, b_{7}, b_{1} b_{5}, b_{1} b_{6}, b_{1} b_{7}, b_{2} b_{7}\right\} .
$$

Proof. Note that $\left|y_{1} y_{2} y_{3}\right|=34$. In $\Omega^{*}(\bar{X})$, we see

$$
b_{1} b_{5}=2 v_{3} y_{t o p}, \quad b_{1} b_{6}=2 v_{2} y_{t o p}, \quad b_{1} b_{7}=2 v_{1} y_{t o p} .
$$

These elements are $\Omega^{*}$-module generators in $\operatorname{Im}\left(\operatorname{res}_{k}^{\bar{k}}\left(\Omega^{*}(X) \rightarrow \Omega^{*}(\bar{X})\right)\right.$ because $2 y_{1} y_{2} y_{3} \notin \operatorname{Im}\left(\operatorname{res}_{k}^{\bar{k}}\right)$ from the fact $t\left(\mathbb{G}_{k}\right)=2^{2}$.

By the arguments similar to Corollary 10.7, we have
Corollary 12.7. Let Tor $\subset C H^{*}(R(\mathbb{G}))$ be the module of torsion elements. Then we have an isomorphism

$$
C H^{*}\left(R\left(\mathbb{G}_{k}\right)\right) /(2, \text { Tor }) \cong \mathbb{Z} / 2\left\{1, b_{2}, \ldots, b_{7}, b_{2} b_{7}\right\}
$$

Let us write $G^{\prime}=E_{8}$ and $G^{\prime \prime}=G_{2}$ so that $G^{\prime \prime} \subset G=E_{7} \subset G^{\prime}$. Take fields $k \subset K \subset K^{\prime}$ such that

$$
\begin{aligned}
& (* *) \quad y_{1}^{2}, y_{2}^{2}, y_{4} \in \operatorname{Res}_{\mathrm{K}}, \quad y_{1}, y_{2}, y_{3} \notin \operatorname{Res}_{\mathrm{K}} \\
& (* * *) \quad y_{1}^{2}, y_{2}, y_{3}, y_{4} \in \operatorname{Res}_{\mathrm{K}^{\prime}}, \quad y_{1} \notin \operatorname{Res}_{\mathrm{K}^{\prime}}
\end{aligned}
$$

Then the following proposition is almost immediate
Proposition 12.8. Suppose $(* *)$ and $(* * *)$. We have isomorphisms,

$$
C H^{*}\left(\left.R\left(\mathbb{G}_{k}^{\prime}\right)\right|_{K}\right) / 2 \cong \mathbb{Z} / 2\left[y_{1}^{2}, y_{2}^{2}, y_{4}\right] /\left(y_{1}^{8}, y_{2}^{4}, y_{4}^{2}\right) \otimes C H^{*}\left(R\left(\mathbb{G}_{K}\right)\right) / 2
$$

the restriction is given by $b_{i} \mapsto b_{i}$ for $1 \leq i \leq 7$ and $b_{8} \mapsto 0$, and

$$
C H^{*}\left(\left.R\left(\mathbb{G}_{K}\right)\right|_{K^{\prime}}\right) / 2 \cong \mathbb{Z} / 2\left[y_{2}, y_{3}\right] /\left(y_{2}^{2}, y_{3}^{2}\right) \otimes C H^{*}\left(R_{2}\right) / 2
$$

the restriction is given by $b_{i} \mapsto b_{i}$ for $i=1,2$, and $b_{i} \mapsto 0$ for $3 \leq i \leq 7$.
