In this paper we shall consider on compact Riemann surfaces the class of quadratic differentials with finite norm and closed trajectories and state some theorems, the detailed proofs of which will be given in another paper ([5]) together with related results.

1. Let \( R \) be a compact Riemann surface of genus \( g (>0) \), we write

\[
\begin{align*}
\tilde{A}_1 &= \tilde{A}_1(R) = \{ \theta : \theta \text{ is a holomorphic abelian differential on } R \}. \\
\tilde{A}_2 &= \tilde{A}_2(R) = \{ \theta : \theta \text{ is a holomorphic quadratic differential on } R \}. \\
A_2D &= A_2D(R) = \{ \phi : \phi \text{ is a meromorphic quadratic differential on } R \}
\end{align*}
\]

such that \(||\phi|| = \int_R |\phi| < +\infty\).

\( CA_2D = CA_2D(R) = \{ \phi \in A_2D \text{ with closed trajectories.} \} \)

\( C\tilde{A}_1 = C\tilde{A}_1(R) = \{ \theta \in \tilde{A}_1 : \theta \in CA_2D \} \)

\( C\tilde{A}_2 = C\tilde{A}_2(R) = CA_2D \cap \tilde{A}_2. \)

Then we can prove the following

Proposition 1 (cf. [1]). Let \( \gamma \) be an arbitrary 1-cycle on \( R \). Then the holomorphic reproducing differential \( \delta \) for \( \gamma \) belongs to \( C\tilde{A}_1 \).

And using this proposition, we have

Proposition 2. The set \( C\tilde{A}_1 \) is dense in \( \tilde{A}_1 \) with respect to the Dirichlet norm.

Thus making two (or four if necessary) sheeted covering surface \( R' \) of \( R \), and considering the class of odd holomorphic reproducing differentials on \( R' \), we can prove the following Strebel's conjecture ([3]).

Theorem 1. The set \( CA_2D \) is dense in \( A_2D \) with respect to the \( ||| \cdot ||| \)-norm. Moreover if \( \phi \in A_2D \) has poles at \( \{ P_i \}_{i=1}^{r} \), then \( \phi \) can be approximated by the elements of \( CA_2D \) with poles at \( \{ P_i \}_{i=1}^{r} \).

The last assertion follows from the fact that the norm convergence is equivalent to the locally uniform convergence.

2. The set of holomorphic reproducing differentials is dense in \( \tilde{A}_1 \). But an element of \( C\tilde{A}_1 \) is not always proportional to some holomorphic reproducing differential in the case that \( g \geq 2 \). This follows from the following
Theorem 2. There exists an admissible curve system \{γ_i\} such that \(D(γ_i) = \{θ ∈ A_1 : θ = \sum_{j=1}^{g} c_j A_j, \text{for real } c_j, \}\) contains a real \(g\)-dimensional manifold, which is contained in

\[P(A_j) = \{θ ∈ A_1 : θ = \sum_{j=1}^{g} c_j A_j, \text{for real } c_j, \}\]

for suitable normal homology base \(\{A_j, B_j\}_{j=1}^{g}\) on \(R\).

Here we remark that for every admissible curve system \(\{γ_i\}\) on \(R\) the set \(D(γ_i)\) is contained in a real \(g\)-dimensional manifold.

3. Let \(T_0\) be the Teichmüller space of compact Riemann surfaces of genus \(g (\equiv 0)\), \(R_0\) and \(R\) be points of \(T_0\), and \(B_{R_0}(R)\) and \(D_{R_0}(R)\) be the Beltrami coefficient and the maximal dilatation of the Teichmüller mapping from \(R_0\) to \(R\), respectively. It is well known that there exist a \(φ ∈ A_1(R_0)\) and \(k (1 > k ≥ 0)\) such that

\[
B_{R_0}(R) = \frac{k}{|φ|}, \quad D_{R_0}(R) = K = \frac{1 + k}{1 - k} (≥ 1).
\]

Now let \(C_R(φ)\) be the Strebel’s contraction of \(φ ∈ A_1(R_0)\) from \(R_0\) to \(R\) (cf. [4]). Then we can characterize \(B_{R_0}(R)\) by this contractions.

Theorem 3. It holds that

\[
D_{R_0}(R) = \sup_{φ ∈ A_1(R_0)} C_R(φ), \quad \frac{1}{D_{R_0}(R)} = \inf_{φ ∈ A_1(R_0)} C_R(φ).
\]

Theorem 4. Let \(B_{R_0}(R) = k/|φ|\) and \(|||φ||| = 1\). If a sequence \(φ_n\) in \(C_1(R_0)\) with \(|||φ_n||| = 1\) satisfies the condition that \(\lim_{n→∞} C_R(φ_n) = 1\) with

\[K = \frac{1 + k}{1 - k}, \text{then } φ_n \text{ converges to } φ \text{ with respect to the } ||||-\text{norm.}\]

As a corollary, if \(C_R(φ) ≥ 1\) for every \(φ ∈ A_1(R_0)\), then \(R\) is conformally equivalent to \(R_0\).
