

NONLINEAR ELLIPTIC BOUNDARY VALUE PROBLEMS AND THE GENERALIZED TOPOLOGICAL DEGREE

BY FELIX E. BROWDER

Communicated March 9, 1970

Introduction. It is our purpose in the present note to present a general existence theorem for noncoercive elliptic boundary value problems for operators of the form:

$$(1) \quad A(u) = \sum_{|\alpha| \leq m} (-1)^{|\alpha|} D^\alpha A_\alpha(x, u, \dots, D^m u),$$

on closed subspaces V of the Sobolev space $W^{m,p}(G)$, G an open subset of R^n , $n \geq 1$. This existence theorem is based upon an extension of the theory of the generalized topological degree for A -proper mappings of Banach spaces introduced in Browder-Petryshyn [8], [9], and, in particular, on an extension of the Borsuk-Ulam theorem to pseudomonotone mappings T from a reflexive separable Banach space V to its conjugate space V^* .

To make a precise statement of our general existence theorem possible, we introduce the following notation: For a given $m \geq 1$, we let ξ be the m -jet of a function u from R^n to R^s for some given $s \geq 1$, i.e. $\xi = \{\xi_\alpha : |\alpha| \leq m\}$, and set

$$\zeta = \{\zeta_\alpha : |\alpha| = m\}, \quad \eta = \{\eta_\beta : |\beta| \leq m-1\},$$

where each ξ_α , ζ_α , and η_β is an element of R^s . The set of all ξ of the above form is an Euclidean space R^{rm} , and correspondingly, $\zeta \in R^{r'm}$, $\eta \in R^{r'm-1}$.

For each α , A_α is assumed to be a function from $G \times R^{rm}$ to R^s satisfying the following conditions:

Assumptions on $A(u)$: (1) $A_\alpha(x, \xi)$ is measurable in x for fixed ξ and continuous in ξ for fixed x . For a given p with $1 < p < \infty$, there exists a constant c such that

$$|A_\alpha(x, \xi)| \leq c \left(1 + \sum_{|\beta| \leq m} |\xi_\beta|^{p_{\alpha\beta}} \right)$$

with $p_{\alpha\beta} \leq (p-1)$ for $|\alpha| = |\beta| = m$, and

AMS 1969 subject classifications. Primary 3547, 3536, 4780, 4785; Secondary 5536.

Key words and phrases. Nonlinear elliptic boundary value problems, generalized topological degree, Sobolev space, coercive, pseudomonotone, Borsuk-Ulam theorems, limit of A -proper mappings.

$$p_{\alpha\beta} < \frac{np + p(m - |\alpha|) - n}{n - p(m - |\beta|)}, \quad \text{if } m - \frac{n}{p} \leq |\alpha| \leq m,$$

$$m - \frac{n}{p} \leq |\beta| \leq m,$$

$$|\beta| + |\alpha| < 2m,$$

$$p_{\alpha\beta} \leq \frac{np}{n - p(m - |\beta|)}, \quad \text{if } |\alpha| < m - \frac{n}{p},$$

$$m - \frac{n}{p} \leq |\beta| \leq m.$$

(2) If $\xi = (\zeta, \eta)$, then for each x in G , η in R^{r-1} , ζ and ζ' in R^r with $\zeta \neq \zeta'$,

$$\sum_{|\alpha|=m} \langle A_\alpha(x, \zeta, \eta) - A_\alpha(x, \zeta', \eta), \zeta_\alpha - \zeta'_\alpha \rangle > 0,$$

(where $\langle \cdot, \cdot \rangle$ denotes the inner product in R^s).

(3) For each γ and γ' in R^r ,

$$\sum_{|\alpha|=m} \langle A_\alpha(x, \zeta, \eta) - \gamma_\alpha, \zeta_\alpha - \gamma'_\alpha \rangle \rightarrow \infty \quad (|\zeta| \rightarrow \infty),$$

uniformly for bounded η .

Let $W^{m,p}(G)$ be the Sobolev space of s -vector functions u such that u and all its derivatives $D^\alpha u$ for $|\alpha| \leq m$ lie in $L^p(G)$ where p is the exponent involved in the inequalities of Assumption (1). Then for any u and v in $W^{m,p}(G)$, we may define the generalized Dirichlet form corresponding to the representation (1) by:

$$(2) \quad a(u, v) = \sum_{|\alpha| \leq m} (A_\alpha(\xi(u)), D^\alpha v),$$

where

$$\xi(u) = \{D^\alpha u : |\alpha| \leq m\}, \quad A_\alpha(\xi(u))(x) = A_\alpha(x, \xi(u)(x)),$$

$$(w, v) = \int_G \langle w(x), u(x) \rangle dx, \quad (\text{integration with respect to Lebesgue } n\text{-measure}).$$

THEOREM 1. Let G be an open subset of R^n with G bounded and the Sobolev Imbedding Theorem valid on G (i.e. G satisfies mild smoothness conditions on its boundary). Let $A(u)$ be a quasilinear elliptic operator of order $2m$ on G of the form

$$(1) \quad A(u) = \sum_{|\alpha| \leq m} (-1)^{|\alpha|} D^\alpha A_\alpha(\xi(u)),$$

where the coefficient functions A_α satisfy Assumptions (1), (2), and (3) above. Suppose that $A(u)$ is odd in u , i.e. $A_\alpha(x, -\xi) = -A_\alpha(x, \xi)$ for each α and all x in G , ξ in R^m . For each w in V^* , the dual space of a closed subspace V of $W^{m,p}(G)$, consider the problem of finding u in V such that $a(u, v) = (w, v)$ for all v in V . Suppose that there exists a continuous function $\phi: R^+ \rightarrow R^+$ such that for each solution u of this problem for any w in V^* ,

$$(3) \quad \|u\|_V = \|u\|_{W^{m,p}(G)} \leq \phi(\|w\|_{V^*}).$$

Then for each w in V^* , there exists at least one solution u in V of the problem: $a(u, v) = (w, v)$ for all v in V .

We have used the notation (w, v) in Theorem 1 to denote the pairing between w in V^* and u in V .

THEOREM 2. Let G be a bounded, smoothly bounded open set in R^n (as in Theorem 1), and consider a one-parameter family of operators $A_t(u)$, $t \in [0, 1]$, where for each t ,

$$(4) \quad A_t(u) = \sum_{|\alpha| \leq m} (-1)^{|\alpha|} D^\alpha A_\alpha(\xi(u); t)$$

and the coefficient functions are continuous in t , uniformly for bounded ξ and all x outside a null set in G . For each t , we take the generalized Dirichlet form

$$(5) \quad a_t(u, v) = \sum_{|\alpha| \leq m} (A_\alpha(\xi(u); t), D^\alpha v),$$

where we assume that $A_t(u)$ satisfies Assumptions (1), (2), (3) for each t in $[0, 1]$. Suppose that $A_1(u)$ is odd, and that there exists a continuous function $\phi: R^+ \rightarrow R^+$ such that if $a_t(u, v) = (w, v)$ for some w in V^* , u in V , t in $[0, 1]$ and all v in V , then $\|u\|_V \leq \phi(\|w\|_{V^*})$.

Then the problem: $a_0(u, v) = (w, v)$ for all v in V ; has a solution u in V for each w in V^* .

Theorem 2 includes Theorem 1 as the special case in which $A_t(u) = A(u)$ for all t in $[0, 1]$. It also includes the standard existence theorem for $A(u)$ in which the Dirichlet form $a(u, v)$ is assumed to be coercive, i.e.

(6) There exists $c: R^+ \rightarrow R^+$ with $c(r) \rightarrow \infty$ as $r \rightarrow \infty$ such that $a(u, u) \geq c(\|u\|_V) \|u\|_V$.

Indeed, if $A(u)$ is coercive, and if we set $A_t(u) = A(u) - tA(-u)$ for t in $[0, 1]$, then $A_0(u) = A(u)$, $A_1(u)$ is odd, the Assumptions (1), (2), and (3) hold for every $A_t(u)$, while since $a_t(u, u) = a(u, u) - ta(-u, u) = a(u, u) + ta(-u, -u)$, it follows that

$$a_t(u, u) \geq (1 + t)c(\|u\|_V)\|u\|_V \geq c(\|u\|_V)\|u\|_V$$

provided that $\|u\|_V > R$, where $c(r) > 0$ for $r > R$. Suppose that for some u in V , w in V^* and t in $[0, 1]$, we have

$$a_t(u, v) = (w, v) \quad (v \in V).$$

Then:

$$c(\|u\|_V)\|u\|_V \leq a_t(u, u) = (w, u) \leq \|w\|_{V^*}\|u\|_V,$$

and as a consequence $c(\|u\|_V) \leq \|w\|_{V^*}$ if $u \neq 0$. If we set $\phi(s) = \sup\{r : c(r) \leq s\}$, it follows that $\|u\|_V \leq \phi(\|w\|_{V^*})$ and by Theorem 2, the equation $a(u, v) = (w, v)$ ($v \in V$), has a solution u in V for each w in V^* .

Existence theorems for elliptic boundary problems of this type were first obtained by Viřik [15] using compactness arguments and a priori estimates on $(m + 1)$ st derivatives. Monotonicity arguments were first applied to these problems in Browder [2], [3], using the basic existence theorem for monotone maps from a reflexive Banach space V to V^* proved independently by Browder [2] and Minty [12]. The existence theorem in the coercive case was extended to elliptic operators $A(u)$ satisfying Assumptions (1), (2), and (3) by Leray-Lions [11]. Borsuk-Ulam theorems for monotone and semimonotone operators in infinite dimensional Banach spaces were first derived by Browder [4], [5], and were first applied to odd, homogeneous, elliptic operators satisfying strong monotonicity conditions by Pohořaev [14]. Theorem 1 was first obtained under a stronger hypothesis (3)' rather than (3) in Browder [6], together with Assumptions (1) and (2) on $A(u)$. This is as follows:

(3)' *There exist continuous functions $k(\eta)$, $k_0(\eta) > 0$ such that*

$$\sum_{|\alpha| \leq m} \langle A_\alpha(x, \zeta, \eta)\zeta_\alpha \rangle \geq k_0(\eta) |\zeta|^p - k(\eta),$$

for all x in G , ζ in R^m , η in R^{n-1} .

1. Proofs of Theorems 1 and 2 rest upon general results concerning two classes of nonlinear mappings of monotone type from a reflexive Banach space V to its conjugate space V^* .

DEFINITION 1. *Let V be a Banach space, V^* its conjugate space, T a mapping from V to V^* , Then:*

(a) *T is said to be pseudomonotone if for any sequence $\{u_j\}$ in V with u_j converging weakly to u in V such that $\limsup (Tu_j, u_j - u) \leq 0$, it follows that for any v in V , $\liminf (Tu_j, u_j - v) \geq (Tu, u - v)$.*

(b) *T is said to satisfy condition $(S)_+$ if for any sequence u_j in V with*

$\{u_j\}$ converging weakly to u in V for which $\lim(Tu_j, u_j - u) \leq 0$, it follows that u_j converges strongly to u in V .

PROPOSITION 1. *Suppose that A satisfies Assumption (1). Then there exists a continuous bounded mapping T of V into V^* for a given closed subspace V of $W^{m,p}(G)$ such that for all u and v of V , $(Tu, v) = a(u, v)$. If $A(u)$ satisfies Assumptions (2) and (3), T is pseudomonotone. If $A(u)$ satisfies Assumptions (2) and (3)', then T satisfies condition (S)₊.*

The proof of Proposition 1 is given in §1 of [7], and Appendix to §1. Pseudomonotonicity was first defined by Brézis in [1] (though our definition differs slightly from his in considering only sequences rather than filters). The condition (S)₊ was first defined in connection with the study of nonlinear eigenvalue problems in Browder [6] and is studied in detail in Browder [7], [8].

THEOREM 3. *Let V be a reflexive separable Banach space, T a mapping of V into V^* which is pseudomonotone, bounded on bounded sets, and continuous from each finite dimensional subspace of V to the weak topology of V^* . Then:*

(a) *If T is an odd mapping outside of some ball around the origin and if $T^{-1}(B)$ is bounded for any bounded subset B of V^* , then $R(T)$, the range of T , is all of V^* .*

(b) *If $\{T_t\}$ is a family of bounded, pseudomonotone, finitely continuous mappings from V to V^* which is continuous in t uniformly on bounded subsets of V , with $T_0 = T$, T_1 odd outside some ball, and if there exists a function $\phi: R^+ \rightarrow R^+$ such that $T_t(u) = w$ implies that*

$$\|u\| \leq \phi(\|w\|) \quad (t \in [0, 1]),$$

then $R(T) = V^$.*

Theorem 3 and Proposition 1 together imply the validity of Theorems 1 and 2. Theorem 3 follows from an extension to the class of pseudomonotone mappings from V to V^* of the theory of the generalized degree defined for A -proper mappings of Banach spaces in Browder-Petryshyn [9], [10] and applied to mappings T from a reflexive V to V^* satisfying condition (S) in Chapter 17 of Browder [8]. The basic facts are summarized in the following theorem:

THEOREM 4. *Let V be a reflexive separable Banach space, V^* its conjugate space. Let T be a mapping from V to V^* which is finitely continuous from V to V^* (i.e. continuous from each finite dimensional subspace of V to the weak topology of V^*) and bounded (i.e. maps bounded subsets of V into bounded subsets of V^*). Then:*

(a) If T is pseudomonotone, there exists a sequence $\{T_j\}$ of finitely continuous, bounded mappings, each satisfying condition $(S)_+$, which converges to T uniformly on every bounded subset of V .

(b) If T satisfies condition $(S)_+$, then T is A -proper in the following sense [9], [10]: If B is a closed ball of V , $\{V_j\}$ an increasing sequence of finite dimensional subspaces of V whose union is dense in V , and if for each j , u_j is an element of $V_j \cap B$ such that for a given element w of V^* ,

$$\|\phi_j^* T u_j - \phi_j^* w\|_{V_j^*} \rightarrow 0 \quad (j \rightarrow \infty),$$

where ϕ_j is the injection map of V_j into V , ϕ_j^* the projection map of V^* onto V_j^* , then there exists an infinite subsequence $\{u_{j(k)}\}$ converging strongly to an element u of B such that $T(u) = w$.

The proof of Theorem 4 is given in Chapter 17 of Browder [8]. The second property tells us that the generalized degree theory of Browder-Petryshyn [10] applies to mappings T satisfying the condition $(S)_+$ (for the details of this application, see [8]). The corresponding generalized degree theory for pseudomonotone maps follows from the convexity of the class of T satisfying $(S)_+$ and the following theorem whose proof will be published elsewhere:

THEOREM 5. Let X and Y be Banach spaces, G a bounded open subset of X , and consider an oriented approximation scheme $\{(X_n, Y_n, P_n, Q_n)\}$ for mappings T of $\text{cl}(G)$ into Y in the sense of [10]. Let Z be a convex family of A -proper mappings from $\text{cl}(G)$ to Y with respect to the given approximation scheme. Let T be a mapping from $\text{cl}(G)$ to Y which is the uniform limit on $\text{cl}(G)$ of mappings T_j from the class Z . Then:

(a) For any sequence $\{T_j\}$ from Z converging to T , if w does not lie in $\text{cl}(T(\text{bdry}(G)))$, then $\text{Deg}(T_j, G, w)$ is the same for all j sufficiently large and does not depend upon the choice of $\{T_j\}$. We denote this limit as $\text{Deg}(T, G, w)$.

(b) $\text{Deg}(T, G, w)$ is invariant under homotopy and weakly additive in the sense of Theorem 1 of [10]. If $\text{Deg}(T, G, w) \neq \{0\}$ and if $T(\text{cl}(G))$ is closed in Y , then w lies in $T(\text{cl}(G))$.

(c) If T is odd in the sense of Theorem 1 of [10], then $\text{Deg}(T, G, 0)$ consists only of odd integers, and $\text{Deg}(T, G, 0) \neq \{0\}$.

ADDED IN PROOF. Results closely related to Theorem 5 have also been obtained by P. M. Fitzpatrick in connection with his Rutgers Ph.D. dissertation.
