INSTRUCTIONS TO AUTHORS

A. General

Manuscripts should be submitted in duplicate. They should preferably be written in English; papers in French or German are also accepted.

Manuscripts must be in their **final form**, typed on one side of each sheet only, with double spacing and wide margins. Formulae should be typewritten whenever possible. Mimeographed copies are not acceptable unless clearly legible.

Please include a "Note for the Printer" explaining markings used. See suggestion overleaf.

To speed up publication, authors will receive **only one set of proofs:** provisionally numbered page proofs. Authors are requested to **correct typographical errors only;** they will be charged for corrections involving changes, additions or deletions to the original manuscript.

Diagrams should be submitted on separate sheets, not included in the text. They should be drawn in Indian ink in clean uniform lines, the whole about twice the size of the finished illustration. Inscriptions should allow for the figure 1, for example, to be about 2 mm high in the final version (i.e. 4 mm for reduction $\times \frac{1}{2}$). The author should mark in the margin of the manuscript where diagrams may be inserted.

Footnotes, other than those which refer to the title heading, should be numbered consecutively and placed at the foot of the page to which they refer (not at the end of the article).

Please give on the first page of the manuscript a **running head** (condensed title), which should not exceed 70 letters including spaces.

References to the literature should be listed at the end of the manuscript. The following information should be provided for **journal articles:** names and initials of all authors, name of the journal, volume, first and last page numbers and year of publication. References to **books** should include name(s) of author(s), full title, edition, place of publication, publisher and year of publication.

Examples

Bombieri, E., Giusti, E.: Inventiones math. 15, 24–46 (1971)

B. Marking

1. Text

The words "Theorem", "Lemma", "Corollary", "Proposition" etc. are normally printed in boldface, followed by the formulation in italics (to be underlined in the manuscript).

The words "Proof", "Remark", "Definition", "Note" etc. are printed in italics with the formulation in ordinary typeface.

Words or sentences to be set in italics should be marked by single underlining.

Letters in formulae are normally printed in italics, figures in ordinary typeface.

It will help the printer if in doubtful cases the position of indices and exponents is marked thus: $b \uparrow$, $a \lor$. Spacing of indices and exponents must be specially indicated $(A_{m,n}^{m,m})$ otherwise they will be set (A_{mn}^{nm}) .

Underlining for special alphabets and typefaces should be done according to the following code:

single underlining:

small letter capital letter

double underlining: brown:

boldface headings, boldface letters in formulae

vellow:

upright

(abbreviations e.g. Re, Im, log, sin, ord, id, lim, sup, etc.)

red: Greek Gothic blue: green: Script

violet:

the numeral 1, and zero (to distinguish them from the small letter l

and the capital letter O)

The following are frequently confused:

$$\cup$$
, \mathbf{U} , $()$, U ; \circ , o , O , 0 ; \times , x , X , κ ; \vee , v , v ; θ , Θ , ϕ , φ , Φ , \emptyset ; ψ , Ψ ; ε , ε ;

the symbol a and the indefinite article a;

also the handwritten Roman letters:

$$c, C; e, l; l, J; k, K; o, O; p, P; s, S; ``u, U; v, V; w, W; x, X; z, Z;$$

Please take care to distinguish them in some way.

Numerical Simulation of Fluid Motion

Proceedings of the International Conference on Numerical Simulation of Fluid Dynamic Systems, Monash University, Melbourne, 1976.

edited by **JOHN NOYE**, Associate Dean, Faculty of Mathematical Sciences, The University of Adelaide, South Australia.

1978 x + 580 pages Price: US \$65.25/Dfl. 150.00 ISBN 0-444-05035-x

In this proceedings volume, mathematicians describe finite differences, finite element, spectral and other numerical methods for solving partial differential equations. There also appear articles in which engineers, physicists, oceanographers and meteorologists report on their experiences in applying these methods to solve fluid flow problems. A number of articles contains comparisons of techniques, thereby permitting the scientist who wishes to solve a particular problem to make a choice of the most appropriate method to use.

The complete coverage provided in this book makes it invaluable for use in high-level undergraduate and postgraduate courses in mathematics, computing science and engineering.

LIST OF PAPERS: Preface. PART 1: Numerical Methods. An Introduction to Finite Difference Techniques (B. J. Noye). The Galerkin Method: An Introduction (C, A. J. Fletcher). On the Application of the Finite Element Method to Problems in Fluid Flow (G. P. Steven). Hybrid Finite Element Methods (G. Fix). The Marker and Cell Technique (L. W. B. Browne). A Direct Macroscopic Relativistic Approach to the Numerical Simulation of

Dynamic Systems (A. G. Barnett). Comparison Between Methods - A Review (R. A. Pearson). PART 2: Applications. Finite Difference Techniques Applied to the Simulation of Tides and Currents in Gulfs (B. J. Nove, K. C. S. Tronson). A Tidal Model of Corio Bay, Victoria (A. K. Easton). Sensitivity Analysis of a Tropical Cyclone Surge Model (B. A. Harper, R. J. Sobey, K. P. Stark). Tidal and Thermal Propagation in a Tidal Estuary (M. D. Teubner, B. J. Noye). A Practical Application of a Network Model (W. R. B. Morrison, P. Arnot Smith). Finite Difference Schemes for the Solution of Linearised Wind Effect Equations (B. J. Noye). Comparison of Some Finite Difference and Analytical Methods of Solving Tidal Propagation Equations (B. Webber, M. M. Rienecker, M. D. Teubner, B. J. Noye). Boundary Conditions for the Navier-Stokes Equations (M. M. Gupta). Natural Convection in a Closed Cavity - A Numerical Experiment (J. C. Patterson). Dependence of Numerical Results on Truncation Errors (R. A. Pearson, P. G. Williams). Some Effects of the Line Dynamics on a Hydraulic System (B. W. Barnard). The Transmission of Sound in Nonuniform Ducts Using a Modified Galerkin Method (W. Eversman). Application of an Improved Method of Integral Relations to the Supersonic Boundary Layer Flow About Cones at Large Angles of Attack (C. A. J. Fletcher). Finite Element Solution for a Fluid Subject to Thermal and Buoyancy Effects (G. P. Steven). Objective Analysis of Geophysical Field Data (W. Wallington). Workshop Participants.
