1. Introduction and Main Results

In the field of valued distribution, the fundamental inequality is an important tool. For example, it can be used to investigate the singular direction [1]. Using geometric theory, Tsuji firstly obtained the second fundamental theory in an angular domain and proved the existence of Borel direction [2]. The value distribution theory of meromorphic functions was extended to algebroidal functions last century [3]. In 1983, Lv and Gu proved an inequality of algebroidal function for an angular domain [4]. By the inequality, some results of singular direction are obtained; see [5, 6]. In [7], the authors obtained a more accurate inequality for angular domain. In this paper, we will use a new method to simplify and extend an inequality of Tsuji to algebroidal functions.

First, we recall some definitions from [3]. Suppose that $A_\nu(z), \ldots, A_0(z)$ are analytic functions with no common zeros in the complex plane. $\Psi(z, W)$ is a bivariate complex function and satisfies

$$\Psi(z, W) = A_\nu(z)W^\nu + A_{\nu-1}(z)W^{\nu-1} + \cdots + A_0(z) = 0. \quad (1.1)$$

For all $z$ in the complex plane, the equation $\Psi(z, W) = 0$ has $\nu$ complex roots $w_1(z), w_2(z), \ldots, w_\nu(z)$. Then, (1.1) defines a $\nu$-valued algebroidal function $W(z)$; see [3, 8]. If $A_\nu(z) = 1$, then $W(z)$ is called $\nu$-valued integral algebroidal function. If $\Psi(z, W)$ is irreducible,
correspondingly \( W(z) \) is called \( v \)-valued irreducible algebroidal function (note that \( W(z) \) is a meromorphic function, if \( v = 1 \)). Now we suppose that \( W(z) \) is an irreducible algebroidal function defined by (1.1).

If \( A_v(z_0) \neq 0 \), and the \( k \)-degree equation \( \Psi(z_0, W) = 0 \) and its partial derivative \( (\partial \Psi/\partial W)(z_0, W) = 0 \) have no common roots (i.e., \( z_0 \) is not a multiple root of \( \Psi(z_0, W) = 0 \)), then \( z_0 \) is said to be a regular point. The set of all regular points is called the regular set, denoted by \( T_W \). Its complementary set \( S_W := \{ z \mid |z| < \infty \} - T_W \) is called the critical set. Obviously, \( S_w \) includes all branch points of \( W \) (see [3]).

The domain of a \( v \)-valued irreducible algebroidal function \( W \) is a connected Riemann surface [8], and its single-valued domain is denoted by \( \tilde{R}_c \). A point in \( \tilde{R}_c \) is \( \tilde{z} \) and sets lying over \( |z| < r \) and \( \{ \phi_1 < \arg z < \phi_2 \} \ (\phi_1 < \phi_2) \) are \( \tilde{\Omega} < r \) and \( \tilde{\Omega}(\phi_1, \phi_2) \). Let \( n(r, W = a) \) and \( n(\Omega(\phi_1, \phi_2), r, W = a) \) be the number of zeros, counted according to their multiplicities, of \( W = a \) in \( \{ \tilde{\Omega} < r \} \) and \( \{ \tilde{\Omega} < r \} \cap \tilde{\Omega}(\phi_1, \phi_2) \), respectively. Let \( \tilde{n}(r, W = a) \) be the number of distinct zeros in \( \{ \tilde{\Omega} < r \} \), and let \( n(r, \tilde{R}_c) \) be the number of branch points in \( \{ \tilde{\Omega} < r \} \). Similarly, we can define \( \tilde{n}(\Omega(\phi_1, \phi_2), r, W = a) \) and \( n(\Omega(\phi_1, \phi_2), r, \tilde{R}_c) \).

Let

\[
S(r, W) = \frac{1}{\pi} \int_{|z|=r} \left( \frac{|W'(z)|}{1 + |W(z)|^2} \right)^2 dW, \quad z = re^{i\theta},
\]

\[
S(\Omega(\phi_1, \phi_2), r, W) = \frac{1}{\pi} \int_{|z|=r \cap \tilde{\Omega}(\phi_1, \phi_2)} \left( \frac{|W'(z)|}{1 + |W(z)|^2} \right)^2 dW,
\]

\[
T(r, W) = \frac{1}{\nu} \int_{0}^{r} \frac{S(t, W)}{t} dt,
\]

\[
T(\Omega(\phi_1, \phi_2), r, W) = \frac{1}{\nu} \int_{0}^{r} \frac{S(\Omega(\phi_1, \phi_2), t, W)}{t} dt,
\]

\[
N(r, W = a) = \frac{1}{\nu} \int_{0}^{r} \frac{n(t, W = a) - n(0, W = a)}{t} dt + \frac{n(0, W = a)}{\nu} \ln r,
\]

\[
N(r, \tilde{R}_c) = \frac{1}{\nu} \int_{0}^{r} \frac{n(t, \tilde{R}_c) - n(0, \tilde{R}_c)}{t} dt + \frac{n(0, \tilde{R}_c)}{\nu} \ln r,
\]

\[
m(r, W) = \frac{1}{2\pi\nu} \sum_{k=1}^{\nu} \int_{0}^{2\pi} 1 + m_k \left( re^{i\theta} \right) |d\theta|.
\]

Similarly, we can define \( N(\Omega(\phi_1, \phi_2), r, W = a) \), \( \tilde{N}(\Omega(\phi_1, \phi_2), r, W = a) \) and \( N(\Omega(\phi_1, \phi_2), r, \tilde{R}_c) \). From [3], we know that \( T(r, \omega) = N(r, W = \infty) + m(r, W) + O(1) \) and \( N(r, \tilde{R}_c) \leq 2(\nu - 1)T(r, W) + O(1) \).

In this paper, we will prove the main theorem.

**Theorem 1.1.** Let \( W(z) \) be a \( v \)-valued algebroidal function in region \( \Omega(\phi_1, \phi_2) \) \( \Delta \) \( \{ |z| \mid \phi_1 < \arg z < \phi_2 \} \) \( (\phi_1 < \phi_2) \). \( a_1, a_2, \ldots, a_q \) \( (q \geq 3) \) are \( q \) different complex numbers on the sphere with
radius $\delta \in (0,1/2)$. For $\phi, \epsilon, \epsilon_0$ ($0 < \epsilon < \epsilon_0 < \phi < \phi - \epsilon < \phi + \epsilon < \phi + \epsilon_0 < \phi + \epsilon < \phi_2$), and $R > R^* > 2$, we have

$$(q - 2)S(\Omega(\phi - \epsilon_0, \phi + \epsilon_0), R^*, W)$$

$$\leq n(\Omega(\phi - \epsilon, \phi + \epsilon), R, \tilde{R}_\epsilon) + \sum_{j=1}^{q} n(\Omega(\phi - \epsilon, \phi + \epsilon), R, W = a_j)$$

$$+ \frac{2^{56}v_24^2 \ln R}{\delta^{38}(\epsilon - \epsilon_0)(\ln R - \ln R^*)} + (q - 2)S\left(\Omega\left(\phi - \epsilon_0, \phi + \epsilon_0, \frac{1}{R^*}, W\right)\right).$$

By the inequality in Theorem 1.2, we will immediately have the following.

**Theorem 1.2.** For a meromorphic function $W$ (a 1-valued algebroidal function with no branch points) defined by (1.1) satisfying

$$\lim_{R \to \infty} \frac{T(r, W)}{\ln^2 R} = \infty,$$

it has at least one Nevanlinna direction, that is, there exists $\arg z = \phi_0$, such that $\sum_{a \in C \cup \{\infty\}} \delta(a, \phi_0) \leq 2$ holds for any finitely many deficient value $a$, where

$$\delta(a, \phi_0) = 1 - \lim_{\epsilon \to 0} \lim_{R \to \infty} \frac{N(\Omega(a - \epsilon, \phi_0 + \epsilon), R, W = a)}{T(\Omega(a - \epsilon, \phi_0 + \epsilon), R, W)} > 0.$$  \hspace{1cm} (1.5)

2. Some Lemmas

First, it is easy to prove the following.

**Lemma 2.1.** Suppose that $a, b > 0$, then there exists $p, q > 0$, such that

$$p + iq = \sqrt[1]{\frac{1}{a - bi}},$$

where

$$p = \sqrt[1]{\frac{\sqrt{a^2 + b^2} + a}{2(a^2 + b^2)}}, \quad q = \sqrt[1]{\frac{\sqrt{a^2 + b^2} - a}{2(a^2 + b^2)}}.$$  \hspace{1cm} (2.2)

**Lemma 2.2.** Suppose that $A(z) = \int_{0}^{z}(dt/\sqrt{1(t^2)})$ and $B(z) = ((1 - z)/(1 + z))i$, then

1. the mapping $G_1 = A \circ B(z)$ maps the unit disc $U$ to the square $Q \triangleq \{z = x + iy \mid 0 < x < 2h, 0 < y < 2h\}$, where $h$ is constant;
2. $G_1$ maps $\{|z| < r\}$, where $0 < r < 1$, into a symmetrical convex region in $Q$;
(3) \( h \) in Lemma 2.2 satisfies

\[
h = \int_{\sqrt{2} - 1}^{1} \frac{dt}{\sqrt{t^2 - t^2}} = \int_{0}^{\sqrt{2} - 1} \frac{dt}{\sqrt{1 - t^2}} > 1.
\]  

(2.3)

Proof. Obviously, (1) holds. By the definition of \( B(z) \), we have \( B(1) = 0, B(-1) = \infty, B(i) = 1, B(-i) = -1 \).

In order to compute \( h \), first we prove that \( G_1 \) maps \( d(0), d(\pi/2), d(\pi/4), d(-\pi/4) \) to four symmetry axes of \( Q \), where \( d(\theta) = \{re^{i\theta}; -1 < r < 1\} \). Let \( z = re^{i\theta} \) (\( \theta \) is fixed), \( r \in (-1, 1) \),

\[
G_1(z) = A \circ B(z) = \int_{0}^{\theta} \frac{dt}{\sqrt{1 - t^2}}
\]

\[
= - (1 + i) \int_{1}^{r} \frac{e^{i\theta}dr}{\sqrt{1 - r^4e^{i4\theta}}}. \tag{2.4}
\]

Hence, when \( \theta = 0, \pi/4, \pi/2, -\pi/4 \), \( \text{arg} \ G_1(re^{i\theta}) = \pi/4, \pi/2, -\pi/4, 0 \), respectively, see Figure 1.

Then, we compute \( h \). Since \( z = 0 \) is the only intersection point of the lines \( d(0) \) and \( d(\pi/4) \). The center of the square \( Q \), \( h + hi \), is that of the curves \( G_1(d(0)) \) and \( G_1(d(\pi/4)) \). Then, \( G_1 \) conforms 0 onto \( h + hi \).

Hence,

\[
h = G_1(e^{i\pi/4}) = A(\sqrt{2} - 1) = \int_{0}^{\sqrt{2} - 1} \frac{dt}{\sqrt{1 - t^2}}
\]

\[
= \int_{\sqrt{2} - 1}^{1} \frac{dt}{\sqrt{1 - t^2}} \tag{2.5}
\]

\[
> \int_{\sqrt{2} - 1}^{1} \frac{dt}{\sqrt{t}} > 1.
\]

(2) At last we prove that \( G_1(|z| < r) \) is a convex region, see Figure 1.
For a fixed \( r \in (0, 1) \), by (2.4),

\[
G_1(re^{i\theta}) = \int_{1}^{r} \frac{-(1 + i)dz}{\sqrt{1 - z^2}}
\]

\[
= (1 + i) \int_{1}^{r} \frac{dr}{\sqrt{1 - r^4}} + \int_{0}^{\theta} \frac{(1 - i)d\theta}{\sqrt{(r^2 - r^4) \cos 2\theta - i(r^2 + r^4) \sin 2\theta}}
\]

Set \( G_1(re^{i\theta}) = x(\theta) + iy(\theta) \). When \( \theta \in (0, \pi/4) \), \( \cos 2\theta, \sin 2\theta > 0 \), by Lemma 2.1,

\[
\frac{\partial G_1}{\partial \theta} = \frac{1 - i}{\sqrt{(r^2 - r^4) \cos 2\theta - i(r^2 + r^4) \sin 2\theta}} = (1 - i)(p + iq)
\]

\[
= (p + q) - (p - q)i \triangleq x' + y'i,
\]

where \( p > q > 0 \).

\[
\frac{\partial^2 G_1}{\partial \theta^2} = \frac{(1 - i)[(r^2 - r^4) \sin 2\theta + i(r^{-2} + r^2) \cos 2\theta]}{(r^2 - r^4) \cos 2\theta - i(r^2 + r^4) \sin 2\theta} = (1 - i)(p + iq)[(r^2 - r^4) \sin 2\theta + i(r^2 + r^4) \cos 2\theta]
\]

\[
(2.7)
\]

\[
= (1 - i)(p + iq)[(r^2 - r^4) \sin 2\theta + i(r^2 + r^4) \cos 2\theta] = (p - q)(r^{-4} - r^4) - 2(p + q) \sin 4\theta
\]

\[
= \frac{(p - q)(r^{-4} - r^4) - 2(p + q) \sin 4\theta}{(r^2 - r^4)^2 \cos^2 2\theta + (r^2 + r^4)^2 \sin^2 2\theta}
\]

\[
+ i \frac{2(p - q) \sin 4\theta + (p + q)(r^4 - r^{-4})}{(r^2 - r^4)^2 \cos 2\theta + (r^2 + r^4)^2 \sin 2\theta} = x'' + y''i.
\]

Hence,

\[
\frac{dy}{dx} = \frac{y'}{x'} = -\frac{p - q}{p + q',}
\]

\[
\frac{d^2y}{dx^2} = \frac{y''x' - y'x''}{x^2} = \frac{2(r^4 - r^{-4})(p^2 + q^2)}{x^2[(r^2 - r^4) \cos 2\theta + (r^2 + r^4)^2 \sin 2\theta]} > 0.
\]

Therefore, the image of \( L(r) = \{re^{i\theta} : 0 < \theta < \pi/4 \} \) is a descending convex curve. By the symmetry of square, \( G_1(||z|| = r) \) is a smooth curve, and \( G_1(||z|| < r < 1) \) is a convex symmetric figure in the square \( Q \).

Then, we obtain Lemma 2.2. \( \square \)
Lemma 2.3. Suppose that mappings

\[ C(z) \triangleq h + i(z - h) \quad \text{(where } h \text{ is defined in Lemma 2.2)}, \]

\[ D(z, \bar{z}) \triangleq \frac{x \ln R}{h} + i \frac{y \varepsilon}{h} = \frac{\log R + \varepsilon}{2h} z + \frac{\log R - \varepsilon}{2h} \bar{z}, \]

\[ H(z) \triangleq e^z, \]

\[ G_2(z) \triangleq C^{-1} \circ D^{-1} \circ H^{-1}(z). \]

Then, the mapping \( G_2 \) maps the region \( E \triangledown \{1/R < |z| < R\} \cap \{|\arg z| \leq \varepsilon\} \) into the square \( Q \), and \( G_2^{-1} \circ G_1 \) maps \( E^* \triangledown \{1/R^* < |z| < R^*\} \cap \{|\arg z| \leq \varepsilon^*\} \), \( R^* \in (2, R), \varepsilon^* \in (0, \varepsilon) \), and

\[ 0 < 1 - r < \min \left\{ \frac{(\varepsilon - \varepsilon^*)^2}{2\pi \varepsilon^2}, \frac{(\varepsilon - \varepsilon^*)(\ln R - \ln R^*)}{4\pi \varepsilon \ln R} \right\}. \]  

Proof. The conclusion is equivalent to \( G_2(E^*) \subset G_1(\{|z| < r\}) \). We prove the lemma by two cases.

Case I. When

\[ \frac{\varepsilon^*}{\varepsilon} \geq \frac{\ln R^*}{\ln R}, \]  

then

\[ 0 \leq \text{arg} \ G_2 \left( h - \frac{he^*}{\varepsilon + i(h - h \ln R^*/\ln R)} \right) = \text{arg} \left[ h \left( \frac{e - e^*}{\varepsilon} + i \frac{\ln R - \ln R^*}{\ln R} \right) \right] \leq \frac{\pi}{4}. \]

\( G_1(\{|z| < r < 1\}) \) is a convex symmetric figure if there exists a \( \theta_0 \in (0, \pi/4] \), such that

\[ \text{Re} \ G_1 \left( re^{i\theta} \right) < h \frac{e - e^*}{\varepsilon}, \]

\[ \text{Im} \ G_1 \left( re^{i\theta} \right) < h \frac{\ln R - \ln R^*}{\ln R}, \]

then Lemma 2.3 holds, see Figure 2.

In fact, for any \( r \in (0, 1), \theta \in (0, \pi/4] \),

\[ G_1 \left( re^{i\theta} \right) = -\int_{1}^{r} \frac{(1 + i) dz}{\sqrt{1 - z^4}} = \int_{e^\theta}^{e^{i\theta}} \frac{(1 + i) dz}{\sqrt{1 - z^4}} + \int_{e^{i\theta}}^{re^\theta} \frac{(1 + i) dz}{\sqrt{1 - z^4}} \triangleq \alpha + \beta, \]  

\[ \text{Re} \ G_1 \left( re^{i\theta} \right) = \alpha, \quad \text{Im} \ G_1 \left( re^{i\theta} \right) = \beta. \]
\[
\alpha = \int_1^{e^{i\theta}} \frac{(1+i)dz}{\sqrt{1-z^4}} = \int_0^{\theta} \frac{-(1+i)e^{i\theta}i}{\sqrt{1-e^{4i\theta}}} \, d\theta
\]
\[
= \int_0^{\theta} \frac{d\theta}{\sin(2\theta)} < \frac{\sqrt{\pi}}{2} \int_0^{\theta} \frac{d\theta}{\sqrt{\theta}} = \sqrt{\pi\theta},
\]
\[
\beta = \int_{e^{i\theta}}^{\mathbf{r}} (1+i)dz \quad \frac{1}{\sqrt{1-r^4}}
\]
\[
= (1+i) \int_r^1 \frac{dr}{\sqrt{(1-r^4)\cos2\theta - i(1+r^4)\sin2\theta}}
\]
\[
\triangleq (1+i) \int_r^1 \frac{dr}{\sqrt{a-bi}},
\]
where
\[
a = \left(1-r^4\right)\cos2\theta < 1, \quad b = \left(1+r^4\right)\sin2\theta,
\]
\[
a^2 + b^2 = 1 + r^8 + 2r^4 \left(\sin^22\theta - \cos^22\theta\right)
\]
\[
= \left(1-r^4\right) + 4r^4\sin^22\theta
\]
\[
> 4r^4\sin2\theta.
\]
By Lemma 2.1, we have
\[
\beta = \int_r^1 (1+i)(p+iq)dr = \int_r^1 [(p-q) + (p+q)i] \, dr
\]
\[
\triangleq \xi + i\eta,
\]
Figure 2
where
\[
\xi = \int_r^1 (p - q) dr = \int_r^1 \frac{p^2 - q^2}{p + q} dr
\]
\[
< \int_r^1 \frac{p^2 + q^2}{p} dr
\]
\[
< \int_r^1 \frac{\sqrt{2} dr}{\sqrt{a^2 + b^2}}
\]
\[
< \int_r^1 \frac{dr}{r^2 \sqrt{2 \sin 2\theta}}
\]
\[
< \frac{1}{2} \frac{1 - r}{r \sqrt{2 \sin 2\theta}}
\]
\[
< \frac{1 - r}{2 r \sqrt{\pi} \theta'}
\]
\[
\eta = \int_r^1 (p + q) dr < 2 \int_r^1 p dr
\]
\[
< 2 \int_r^1 \frac{dr}{\sqrt{a^2 + b^2}}
\]
\[
< \frac{1 - r}{r \sqrt{2 \theta'}}.
\]

Let
\[
\theta_0 = \frac{(\varepsilon - \varepsilon^*)^2}{4 \pi \varepsilon^2} < \frac{\pi}{4}
\]
(2.20)

Combining (3.1) (note that by (3.1), we have \( r > \sqrt{2} / 2 \),

\[
\text{Re} \ G_1(\text{re}^{i\theta}) = \alpha + \xi < \sqrt{\pi \theta_0} \frac{1}{2r} \sqrt{\frac{\pi}{\theta_0}}
\]
\[
< \frac{h(\varepsilon - \varepsilon^*)}{\varepsilon},
\]
\[
\text{Im} \ G_1(\text{re}^{i\theta}) = \eta < \frac{1 - r}{r} \sqrt{\frac{\pi}{2\theta}}
\]
\[
< \frac{1 \ln R - \ln R^*}{2 \ln R}
\]
\[
< \frac{\ln R - \ln R^*}{\ln R}.
\]
(2.21)
Therefore, a vertex of $G_2(E^*)(h - e^*h/\varepsilon, h - h\ln R^* / \ln R) \in G_1(\{|z| < r\})$. By Lemma 2.2, $G_2(E^*) \subset G_1(\{|z| < r\})$.

Case II. When

$$\frac{\varepsilon^*}{\varepsilon} \leq \frac{\ln R^*}{\ln R},$$

(2.22)

since $G_1(\{|z| < r < 1\})$ is a convex symmetric figure, we also have Lemma 2.3, see Figure 3. \(\square\)

For the convenience of readers, we prove the following lemma again, it can be found in [9].

**Lemma 2.4.** (1) Let $G(z) = G_2^{-1} \circ G_1(z)e^{i\phi}$, then

$$|G_z| + |G_{\overline{z}}| \leq \frac{\ln R}{\varepsilon} (|G_z| - |G_{\overline{z}}|).$$

(2.23)

(2) Put $s(x, y) = \text{Re} G$, $t(x, y) = \text{Im} G$, then

$$s_x^2 + s_y^2 + t_x^2 + t_y^2 \leq \frac{\ln R}{\varepsilon} (s_xt_y - s_yt_x).$$

(2.24)

**Proof.** (1) Since $f = H^{-1} \circ G_1(z)e^{i\phi}$ and $C^{-1}$ are holomorphic functions, then

$$\left| \frac{f_z}{z} \right| = |f_z| = \left| (C^{-1}) f_{\overline{z}} \right| = 0, \quad \left| \frac{f_{\overline{z}}}{\overline{z}} \right| = |f_z|.$$

(2.25)

For

$$D(z) = \frac{x \ln R}{h} + i \frac{y \varepsilon}{h}$$

(2.26)
then

\[ D^{-1}(f, \bar{f}) = \frac{xh}{\ln R} + i\frac{yh}{\epsilon} \]

\[ = \frac{h(f + \bar{f})}{2\ln R} + \frac{h(f - \bar{f})}{\epsilon}. \] (2.27)

Hence,

\[
\max\left\{ \left| D^{-1}_f \right| + \left| D^{-1}_f \right|, \left| D^{-1}_f \right| - \left| D^{-1}_f \right| \right\} = \frac{\ln R + \epsilon}{|\ln R + \epsilon| - |\ln R - \epsilon|} = \frac{\ln R}{\epsilon}. \] (2.28)

Thus,

\[
|G_z| + |G_\bar{z}| = \left| \left( C^{-1} \right)_{D^{-1}_f} D^{-1}_f f_z \right| + \left| \left( C^{-1} \right)_{D^{-1}_f} D^{-1}_f \bar{f}_z \right|
\leq \left| \left( C^{-1} \right)_{D^{-1}_f} f_z \right| \frac{\ln R}{\epsilon} \left( \left| D^{-1}_f \right| - \left| D^{-1}_f \right| \right)
= \frac{\ln R}{\epsilon} \left( \left| \left( C^{-1} \right)_{D^{-1}_f} f_z \right| - \left| \left( C^{-1} \right)_{D^{-1}_f} \bar{f}_z \right| \right). \] (2.29)

(2) By

\[ s_x = s_z + s_{\bar{z}}, \]
\[ s_y = s_z - is_{\bar{z}}, \] (2.30)

we have

\[ s_z = \frac{s_x - is_y}{1 - i}, \quad s_{\bar{z}} = \frac{s_y - is_x}{1 - i}. \] (2.31)

Similarly,

\[ t_z = \frac{t_x - it_y}{1 - i}, \quad t_{\bar{z}} = \frac{t_y - it_x}{1 - i}. \] (2.32)

Then,

\[ |G_z|^2 = \frac{1}{2} \left[ (t_y + s_x)^2 + (t_x - s_y)^2 \right], \] (2.33)
\[ |G_\bar{z}|^2 = \frac{1}{2} \left[ (t_x + s_y)^2 + (t_y - s_x)^2 \right]. \]
Therefore,
\[ s^2_x + s^2_y + t^2_x + t^2_y = |G_z|^2 + |G^2|^2 \]
\[ \leq (|G_z| + |G^2|)^2 \]
(by (2.23)) \[ \leq \frac{\ln R}{\varepsilon} \left(|G_z|^2 - |G^2|^2\right) \]
\[ \leq \frac{\ln R}{\varepsilon} (s_xt_y - s_yt_x). \]

**Lemma 2.5** (see [10]). Let \( F \) be a connected covering surface on \( F_0, F_0 \) is bounded by \( q \) different points with radius \( \delta \in (0, 1/2) \), then

\[ \max\{0, \rho(F)\} \geq (q - 2)S - 2^{25}\pi^{11}\delta^{-19}L, \]

where \( L \) is the length of \( F \) and \( \rho(F) \) is Euler characteristic of \( F, |F| \) is the area of \( F \) and

\[ S = \frac{|F|}{|F_0|}. \]

**Lemma 2.6** (see [10]). Let \( V \) be a sphere with radius \( 1/2, F_0 \) be bounded by \( q \) different points with radius \( \delta \in (0, 1/2) \) and \( F_r = W \circ G(F_0) \) then

\[ S = \frac{|F_r|}{|F_0|} = \frac{1}{\pi} \sum_{k=1}^{v} \int_{0}^{2\pi} \int_{0}^{r} \frac{|w_k'|^2 (s_xt_y - s_yt_x)r}{\left(1 + |w_k \circ G|^2\right)^2} \, dr \, d\theta, \]

where \( s(x, y) = \text{Re} \, G, t(x, y) = \text{Im} \, G. \)

**Proof.** Suppose that \( w_k = u + iv \). Then

\[ |F_r| = \sum_{k=1}^{v} \int_{G(\|x\| \leq r)} \frac{1}{\left(1 + |w_k|^2\right)^2} \, du \, dv, \]

where

\[ du = (u_s s_x + u_t t_x) \, dx + (u_s s_y + u_t t_y) \, dy, \]
\[ dv = (v_s s_x + v_t t_x) \, dx + (v_s s_y + v_t t_y) \, dy. \]
Hence, by the Jacobian determinant, we have
\[
du dv = \left[ \left( u_x^2 + v_x^2 \right) (s_x t_y - s_y t_x) \right] dx dy,
\]
\[
|F_r| = \sum_{k=1}^v \iint_{|z| < cr} \frac{(u_x^2 + v_x^2)(s_x t_y - s_y t_x)}{\left( 1 + |w_k \circ G|^2 \right)^2} dx dy
\]
\begin{equation}
= \sum_{k=1}^v \int_0^r \int_0^{2\pi} \frac{|w_k'|^2 (s_x t_y - s_y t_x) r}{\left( 1 + |w_k \circ G|^2 \right)^2} dr d\theta.
\end{equation}

By $|F_0| = \pi$, we have Lemma 2.6.

\[\square\]

3. Proof of Theorem 1.1

Proof. Set $G(z) = G_0^{-1} \circ G_1(z)e^{i\phi}$. It conforms the unit disc $U = \{|z| < 1\}$ to the sector $E = \{1/R < |W| < R\} \cap \{||z - \phi| < \varepsilon\}$ and the interior of $E^* = \{|z| < r\}$ to $E^* = \{1/R^* < |W| < R^*\} \cap \{||z - \phi| < \varepsilon^*\}$, where $2 < R^* < R, 0 < \varepsilon^* < \varepsilon$, and

\[
0 < 1 - r < \min \left\{ \frac{(\varepsilon - \varepsilon^*)^2}{2\pi \varepsilon^2}, \frac{(\varepsilon - \varepsilon^*)(\ln R - \ln R^*)}{4\pi \varepsilon \ln R} \right\}.
\]

Hence $W \circ G$ conforms $\{|z| < r\}$ to the sphere $V$.

Put $\tilde{D}_r = \{|z| < r\}$. Then by M. Hurwite Formula, we have

\[
\rho \left( \tilde{D}_r \right) = n \left( r, \tilde{R}_z \right) - v.
\]

Put $D_r = \tilde{D}_r - \{z \mid \prod_{j=1}^q (w \circ G(z) - a_j) = 0\}$ and $F_r = W \circ G(F_0)$. Then

\[
\rho(F_r) = \rho(D_r) = n \left( r, \tilde{R}_z \right) - v + \sum_{j=1}^q \tilde{n}(r, W \circ G = a_j)
\]
\begin{equation}
\leq n \left( 1, \tilde{R}_z \right) - v + \sum_{j=1}^q \tilde{n}(1, W \circ G = a_j) \triangleq N.
\end{equation}

By Lemma 2.5, it follows that

\[
N \geq \rho(F_r) \geq (q - 2) S(r, W \circ G) - 2^{27} \pi^{11} \delta^{-19} L(r).
\]

Now we will prove

\[
L^2(r) \leq 2^4 v \pi r \frac{\ln R}{\varepsilon} \frac{dS(r, W \circ G)}{dr}.
\]
For any $r \in (0, 1)$, $k = 1, 2, \ldots, n$ and $\varepsilon > 0$, we have
\[
\left| \left| w_k \circ G\left(re^{i\theta}\right) \right| - \left| w_k \circ G' \right| \right| < \varepsilon, \tag{3.6}
\]
where $\theta_j = j\pi/n (j = 1, 2, \ldots, 2n)$, $\theta \in [\theta_{j-1}, \theta_j]$, $|w_k \circ G'| = \min(|w_k \circ G(re^{i\theta})|, \theta_{j-1} \leq \theta \leq \theta_j)$.

By (3.6), for any $\theta \in [\theta_{j-1}, \theta_j]$, we have
\[
\left| w_k \circ G\left(re^{i\theta}\right) \right|^2 \leq \left| w_k \circ G' \right|^2 + 2\varepsilon \left( \varepsilon + \left| w_k \circ G' \right| \right). \tag{3.7}
\]
Therefore
\[
\frac{1 + \left| w_k \circ G\left(re^{i\theta}\right) \right|^2}{1 + \left| w_k \circ G' \right|^2} \leq 1 + \frac{2\varepsilon^2}{1 + \left| w_k \circ G' \right|^2} + \frac{2\varepsilon}{1 + \left| w_k \circ G' \right|^2} \leq \sqrt{2}. \tag{3.8}
\]

Put $w_k = u_k(s, t) + iv_k(s, t), G = s(r, \theta) + it(r, \theta)$. Hence
\[
L_k(r) = \lim_{n \to \infty} \sum_{j=1}^{2n} \frac{|w_k \circ G(re^{i\theta}) - w_k \circ G\left(re^{i\theta_{j-1}}\right)|}{\sqrt{1 + \left| w_k \circ G\left(re^{i\theta}\right) \right|^2}} \sqrt{1 + \left| w_k \circ G\left(re^{i\theta_{j-1}}\right) \right|^2}
\leq \lim_{n \to \infty} \sum_{j=1}^{2n} \left\{ \left[ \int_{\theta_{j-1}}^{\theta_j} \left( (u_k)_s s_\theta + (u_k)_r t_\theta \right) d\theta \right]^2 + \left[ \int_{\theta_{j-1}}^{\theta_j} \left( (v_k)_s s_\theta + (v_k)_r t_\theta \right) d\theta \right]^2 \right\}^{1/2}
\leq \sqrt{2} \lim_{n \to \infty} \sum_{j=1}^{2n} \int_{\theta_{j-1}}^{\theta_j} \frac{\left[ ((u_k)_s s_\theta + (u_k)_r t_\theta)^2 + ((v_k)_s s_\theta + (v_k)_r t_\theta)^2 \right]^{1/2}}{1 + \left| w_k \circ G' \right|^2} d\theta
\leq 2 \int_0^{2\pi} \frac{|w'_k| \left( s_\theta^2 + t_\theta^2 \right)^{1/2}}{1 + \left| w_k \circ G' \right|^2} d\theta.
\]

By
\[
s_\theta = -s_x r \sin \theta + s_y r \cos \theta, \tag{3.10}
\]
\[
t_\theta = -t_x r \sin \theta + t_y r \sin \theta,
\]
where
\[
x = -r \cos \theta, \tag{3.11}
\]
\[
y = r \sin \theta,
\]
we obtain
\[
s_0^2 + t_0^2 \leq 2r^2 \left(s_x^2 + s_y^2 + t_x^2 + t_y^2\right),
\]
\[
L^2(r) = \left(\sum_{k=1}^{v} L_k(r)\right)^2 \leq 8 \left[\sum_{k=1}^{v} \int_0^{2\pi} |w'_k| \left(s_x^2 + s_y^2 + t_x^2 + t_y^2\right)^{1/2} r \frac{d\theta}{1 + |w_k \circ G|^2}\right]^2
\]
(by (2.24)) \leq \frac{8 \ln R}{\varepsilon} \left[\sum_{k=1}^{v} \int_0^{2\pi} |w'_k| \left(s_x t_y - s_y t_x\right)^{1/2} r \frac{d\theta}{1 + |w_k \circ G|^2}\right]^2
\]
(Cauchy inequality) \leq \frac{8v}{\varepsilon} \sum_{k=1}^{v} \left[\int_0^{2\pi} \left|w'_k\right|^2 \left(s_x t_y - s_y t_x\right) r \frac{d\theta}{1 + |w_k \circ G|^2}\right] \left[\int_0^{2\pi} r d\theta\right] \leq \frac{16v\pi r}{\varepsilon} \sum_{k=1}^{v} \int_0^{2\pi} \left|w'_k\right|^2 \left(s_x t_y - s_y t_x\right) r \frac{d\theta}{1 + |w_k \circ G|^2}\]
(Schwarz inequality) \leq \frac{16v\pi r}{\varepsilon} \sum_{k=1}^{v} \left[\int_0^{2\pi} \left|w'_k\right|^2 \left(s_x t_y - s_y t_x\right) r \frac{d\theta}{1 + |w_k \circ G|^2}\right] \left[\int_0^{2\pi} r d\theta\right]
(by Lemma 2.6) \leq \frac{16v\pi r}{\varepsilon} \sum_{k=1}^{v} \int_0^{2\pi} \left|w'_k\right|^2 \left(s_x t_y - s_y t_x\right) r \frac{d\theta}{1 + |w_k \circ G|^2}\]
(1) If for all \(r' \in (r, 1)\)
\[
S(r, W \circ G) \geq \frac{N}{q - 2},
\]
then by (3.4)
\[
\left(S(r', W \circ G) - \frac{N}{q - 2}\right)^2 \leq \frac{2^{50}\pi^{22}}{(q - 2)^2 \delta^{38}} L(r')
\]
(by (3.5)) \leq \frac{2^{54}v\pi^{23}r' \ln R dS(r', W \circ G)}{(q - 2)^2 \delta^{38} \varepsilon} \left(S(r', W \circ G) - \frac{N}{(q - 2)}\right)^2.
\]
that is,
\[
dx' \leq \frac{2^{54}v\pi^{23} \ln R}{(q - 2)^2 \delta^{38} \varepsilon} \left(S(r', W \circ G) - N/(q - 2)\right)^2.
\]
Hence,

\[ 1 - r = \int_r^1 dr' \leq \frac{2^{23}v_\pi \ln R}{(q-2)^2 \delta^{38}\varepsilon} \int_r^1 \frac{dS'(r', W \circ G)}{(S'(r', W \circ G) - N/(q-2))^2} \]
\[ \leq \frac{2^{23}v_\pi \ln R}{(q-2)^2 \delta^{38}\varepsilon} \left( \frac{1}{S(r, W \circ G) - N/(q-2)} - \frac{1}{S(R, W \circ G) - N/(q-2)} \right) \]
\[ < \frac{2^{23}v_\pi \ln R}{\delta^{38}\varepsilon} \left( 1 - \frac{1}{S(r, W \circ G) - N} \right). \]

Therefore

\[ (q-2)S(r, W \circ G) \leq \frac{2^{23}v_\pi \ln R}{\delta^{38}\varepsilon(1-r)} + N \]
\[ \leq n(1, \tilde{R}_\varepsilon) + \sum_{j=1}^q n_j(1, W \circ G = a_j) + \frac{2^{23}v_\pi \ln R}{\delta^{38}\varepsilon(1-r)}. \]  

(3.17)

(2) If there is a \( r' \in (r, 1) \), such that

\[ (q-2)S(r', W \circ G) - N < 0, \]  

(3.18)

then

\[ (q-2)S(r, W \circ G) < (q-2)S(r', W \circ G) < N, \]  

(3.19)

Equation (3.17) holds.

By (3.17) and Lemma 2.3, we have

\[ (q-2)S(\Omega(\phi - \varepsilon, \phi + \varepsilon, R^*, W)) - (q-2)S(\Omega(\phi - \varepsilon^*, \phi + \varepsilon^*, \frac{1}{R^*}, W)) \]
\[ \leq (q-2)S(r, W \circ G) \]
\[ \text{(by (3.1))} \leq n(\Omega(\phi - \varepsilon, \phi + \varepsilon), R, \tilde{R}_\varepsilon) + \sum_{j=1}^q n_j(\Omega(\phi - \varepsilon, \phi + \varepsilon), R, W = a_j) \]
\[ + \frac{2^{24}v_\pi \ln R}{\delta^{38}(\varepsilon - \varepsilon^*)(\ln R - \ln R^*)}. \]

(3.20)
4. Proof of Theorem 1.2

Proof. By the hypothesis of Theorem 1.2, there exists an increasing sequence $R_n$ ($R_n \to \infty$, when $n \to \infty$), such that

$$\lim_{n \to \infty} \frac{T(R_n, W)}{\ln^2 R_n} = +\infty.$$  \hfill (4.1)

Then, there exist some $\phi_0 \in [0, 2\pi]$, such that for arbitrary $\varepsilon \in (0, \phi_0)$,

$$\lim_{n \to \infty} \frac{T(R_n, \phi_0 - \varepsilon, \phi_0 + \varepsilon, W)}{\ln^2 R_n} = +\infty$$

holds. We claim that $\arg z = \phi_0$ is the Nevanlinna direction.

Otherwise, for a positive number $\varepsilon_0$, there exist some $a_1, a_2, \ldots, a_q$ ($q \geq 3$), such that

$$\sum_{j=1}^{q} \delta(a_j, \phi_0) > 2 + 3\varepsilon_0.$$  \hfill (4.3)

By the definition of $\delta(a_j, \phi_0)$, we have

$$\lim_{\varepsilon \to 0^+} \lim_{R \to \infty} \frac{\sum_{j=1}^{q} \text{N}((\Omega(\phi_0 - \varepsilon, \phi_0 + \varepsilon), R, W = a_j))}{T(\Omega(\phi_0 - \varepsilon, \phi_0 + \varepsilon), R, W)} < q - 2 - 3\varepsilon_0.$$  \hfill (4.4)

There exists $\varepsilon_1 > 0$, such that for any $\varepsilon \in (0, \varepsilon_1)$,

$$\lim_{R \to \infty} \frac{\sum_{j=1}^{q} \text{N}((\Omega(\phi_0 - \varepsilon, \phi_0 + \varepsilon), R, W = a_j))}{T(\Omega(\phi_0 - \varepsilon, \phi_0 + \varepsilon), R, W)} < q - 2 - 2\varepsilon_0.$$  \hfill (4.5)

Hence, for $\{R_n\}$ defined earlier, when $n$ is sufficiently large,

$$\sum_{j=1}^{q} \text{N}((\Omega(\phi_0 - \varepsilon, \phi_0 + \varepsilon), R_n, W = a_j)) < (q - 2 - \varepsilon_0) T(\Omega(\phi_0 - \varepsilon, \phi_0 + \varepsilon), R_n, W).$$  \hfill (4.6)
By Theorem 1.1, we have

\[(q - 2)S\left(\Omega\left(\phi - \frac{\varepsilon}{2}, \phi + \frac{\varepsilon}{2}\right), R, W\right) - (q - 2)S\left(\Omega\left(\phi - \frac{\varepsilon}{2}, \phi + \frac{\varepsilon}{2}, 1\right), W\right) \leq \sum_{j=1}^{a} n(\Omega(\phi - \varepsilon, \phi + \varepsilon), 2R, W = a_j) + \frac{2^{52} \pi^{24} \ln 2}{\delta^{38} \varepsilon \ln 2}.\]

Hence,

\[(q - 2)T\left(\Omega\left(\phi - \frac{\varepsilon}{2}, \phi + \frac{\varepsilon}{2}\right), R_n, W\right) \leq \sum_{j=1}^{a} N(\Omega(\phi - \varepsilon, \phi + \varepsilon), R_n, W = a_j) + \frac{2^{54} \pi^{24} \ln 2 \ln 2}{\delta^{38} (\varepsilon - \varepsilon^*) \ln 2} + O(1) < (q - 2 - \varepsilon_0 + O(1)) \ln^2 R_n.\]

Hence,

\[\lim_{n \to \infty} \frac{T(\Omega(\phi - \varepsilon/2, \phi + \varepsilon/2), R_n, W)}{\ln^2 R_n} < O(1),\]

which contradicts (4.2). Therefore, Theorem 1.2 holds. \(\square\)
