We introduce three new two-parameter generalizations of Fibonacci numbers. These generalizations are closely related to $k$-distance Fibonacci numbers introduced recently. We give combinatorial and graph interpretations of distance $(r, k)$-Fibonacci numbers. We also study some properties of these numbers.

## 1. Introduction

In general we use the standard terminology of the combinatorics and graph theory; see [1]. The well-known Fibonacci sequence $\left\{F_{n}\right\}$ is defined by the recurrence $F_{n}=F_{n-1}+F_{n-2}$ for $n \geq 2$ with $F_{0}=F_{1}=1$. The Fibonacci numbers have been generalized in many ways, some by preserving the initial conditions and others by preserving the recurrence relation. For example, in [2] $k$-Fibonacci numbers were introduced and defined recurrently for any integer $k \geq 1$ by $F(k, n)=$ $k F(k, n-1)+F(k, n-2)$ for $n \geq 2$ with $F(k, 0)=0$, $F(k, 1)=1$. In [3] the following generalization of the Fibonacci numbers was defined: $x_{n}=2^{r} x_{n-1}+x_{n-2}$ for an integer $r \geq 0$ such that $4^{r-1}+1 \neq 0$ and $n \geq 2$ with $x_{0}=0$ and $x_{1}=1$. Other interesting generalizations of Fibonacci numbers are presented in $[4,5]$. In the literature there are different kinds of distance generalizations of $F_{n}$. They have many graph interpretations closely related to the concept of $k$-independent sets. We recall some of such generalizations:
(1) Reference [6]. Consider $F(k, n)=F(k, n-1)+F(k, n-$ $k)$ for $n \geq k+1$ with $F(k, n)=n+1$ for $n \leq k$.
(2) References $[4,7,8]$. Consider Fibonacci $p$-numbers $F_{p}(n)=F_{p}(n-1)+F_{p}(n-p-1)$ for any given $p(p=$
$1,2,3, \ldots)$ and $n>p+1$ with $F_{p}(0)=0$ and $F_{p}(n)=1$ for $1 \leq n \leq p+1$.
(3) Reference [9]. Consider $F d^{(1)}(k, n)=F d^{(1)}(k, n-k+$ $1)+F d^{(1)}(k, n-k)$ for $n \geq k$ with $F d^{(1)}(k, n)=1$ for $n \leq k-1$.
(4) Reference [9]. Consider $F d^{(2)}(k, n)=F d^{(2)}(k, n-k+$ $1)+F d^{(2)}(k, n-k)$ for $n \geq k$ with $F d^{(2)}(k, n)=0$ for $n=0, \ldots, k-2, \operatorname{Fd}^{(2)}(k, k-1)=1, \operatorname{Fd}^{(2)}(1,1)=1$, $F d^{(2)}(2,2)=2$, for $k \geq 3 F d^{(2)}(k, k)=1$.
(5) Reference [9]. Consider $F d^{(3)}(k, n)=F d^{(3)}(k, n-k+$ $1)+F d^{(3)}(k, n-k)$ for $n \geq 2 k-1$ with $F d^{(3)}(k, n)=1$ for $n=0, \ldots, k-1, F d^{(3)}(2,2)=2$, for $k \geq 3 F d^{(3)}(k, k)=$ $F d^{(3)}(k, 2 k-2)=3$, for $k+1 \leq n \leq 2 k-1 F d^{(3)}(k, n)=$ 4.
(6) Reference [10]. Consider $F_{2}^{(1)}(k, n)=F_{2}^{(1)}(k, n-2)+$ $F_{2}^{(1)}(k, n-k)$ for $n \geq k+1$ with

$$
F_{2}^{(1)}(k, n)= \begin{cases}1 & \text { if } n \leq k-1 \text { or } n=k=1  \tag{1}\\ 2 & \text { if } n=k \geq 2\end{cases}
$$

Table 1: Distance $(r, k)$-Fibonacci numbers $F_{r}^{(\mathrm{I})}(k, n)$ of the first kind.

(7) Reference [11]. Consider $F_{2}^{(2)}(k, n)=F_{2}^{(2)}(k, n-2)+$ $F_{2}^{(2)}(k, n-k)$ for $n \geq k+1$ with
$F_{2}^{(2)}(k, n)= \begin{cases}0 & \text { if } n \text { is odd and } n \leq k-1, \\ 1 & \text { if } n \text { is even and } n \leq k-1,\end{cases}$
$F_{2}^{(2)}(k, k)= \begin{cases}0 & \text { if } k=1, \\ 1 & \text { if } k \text { is odd and } k \geq 3, \\ 2 & \text { if } k \text { is even. }\end{cases}$
(8) Reference [11]. Consider $F_{2}^{(3)}(k, n)=F_{2}^{(3)}(k, n-2)+$ $F_{2}^{(3)}(k, n-k)$ for $n \geq k+1$ with

$$
\begin{align*}
& F_{2}^{(3)}(k, n)= \begin{cases}1 & \text { if } n \text { is even and } n \leq k-1, \\
2 & \text { if } n \text { is odd and } n \leq k-1,\end{cases}  \tag{3}\\
& F_{2}^{(3)}(k, k)= \begin{cases}3 & \text { if } k \text { is odd and } k \geq 3, \\
2 & \text { if } k \text { is even or } k=1 .\end{cases}
\end{align*}
$$

In this paper we introduce three new two-parameter generalizations of distance Fibonacci numbers. They are closely related with the numbers $F_{2}^{(j)}(k, n), j=1,2,3$, presented in $[10,11]$. We show their combinatorial and graph interpretations and we present some identities for them.

## 2. Distance ( $r, k$ )-Fibonacci Numbers

Let $k \geq 1, n \geq 0$, and $r \geq 1$ be integers. We define distance $(r, k)$-Fibonacci numbers of the first kind $F_{r}^{(\mathrm{I})}(k, n)$ by the recurrence relation

$$
\begin{equation*}
F_{r}^{(\mathrm{I})}(k, n)=r F_{r}^{(\mathrm{I})}(k, n-2)+r^{k-1} F_{r}^{(\mathrm{I})}(k, n-k) \tag{4}
\end{equation*}
$$

for $n \geq k+1$
with the following initial conditions:

$$
\begin{aligned}
F_{r}^{(\mathrm{I})}(k, 0) & =F_{r}^{(\mathrm{I})}(k, 1)=1, \\
F_{r}^{(\mathrm{I})}(k, n) & =r^{[n / 2]} \quad \text { for } n=2,3, \ldots, k-2, \\
F_{r}^{(\mathrm{I})}(k, k-1) & =r^{[(k-1) / 2]} \quad \text { for } k \geq 3, \\
F_{r}^{(\mathrm{I})}(k, k) & =r^{k-1}+r^{[k / 2]} \quad \text { for } k \geq 2 .
\end{aligned}
$$

For $r=1$ we get $F_{1}^{(\mathrm{I})}(k, n)=F_{2}^{(1)}(k, n)$. These numbers were introduced in [10].

If $r=1$ and $k=1$, then $F_{1}^{(\mathrm{I})}(1, n)$ gives the Fibonacci numbers $F_{n}$. For $r=1$ and $k=3$ the numbers $F_{1}^{(1)}(3, n)$ are the well-known Padovan numbers.

Table 1 includes the values of $F_{r}^{(\mathrm{I})}(k, n)$ for special values of $k$ and $n$.

Let $k \geq 1, n \geq 0$, and $r \geq 1$ be integers. We define the distance $(r, k)$-Fibonacci numbers of the second kind $F_{r}^{(\mathrm{II})}(k, n)$ by the following recurrence relation:

$$
\begin{equation*}
F_{r}^{(\mathrm{II})}(k, n)=r F_{r}^{(\mathrm{II})}(k, n-2)+r^{k-1} F_{r}^{(\mathrm{II})}(k, n-k) \tag{6}
\end{equation*}
$$

$$
\text { for } n \geq k+1
$$

with initial conditions

$$
\left.\left.\begin{array}{l}
F_{r}^{(\mathrm{II})}(k, n)= \begin{cases}r^{[n / 2]} & \text { for even } n, \\
0 & \text { for odd } n,\end{cases} \\
\text { for } n=0,1, \ldots, k-1
\end{array}\right\} \begin{array}{ll}
0 & \text { for } k=1,
\end{array}\right\} \begin{array}{ll}
F_{r}^{(\mathrm{II})}(k, k)= \begin{cases}r^{k-1} & \text { for odd } k, k \geq 3, \\
r^{k-1}+r^{k / 2} & \text { for even } k .\end{cases} \tag{7}
\end{array}
$$

For $r=1$ we have then $F_{1}^{(\mathrm{II})}(k, n)=F_{2}^{(2)}(k, n)$; see [10]. Moreover, for $r=1$ and $k=1, n \geq 2 F_{1}^{(\mathrm{II})}(k, n)=F_{n-2}$.

In Table 2 a few first words of the distance $(r, k)$-Fibonacci numbers of the second kind $F_{r}^{(\mathrm{III})}(k, n)$ for special values of $k$ and $n$ are presented.

Let $k \geq 1, n \geq 0$, and $r \geq 1$ be integers. We define distance $(r, k)$-Fibonacci numbers of the third kind $F_{r}^{(\text {III })}(k, n)$ by the following recurrence relation:

$$
\begin{equation*}
F_{r}^{(\mathrm{III})}(k, n)=r F_{r}^{(\mathrm{III})}(k, n-2)+r^{k-1} F_{r}^{(\mathrm{III})}(k, n-k) \tag{8}
\end{equation*}
$$

for $n \geq k+1$

Table 2: Distance $(r, k)$-Fibonacci numbers $F_{r}^{(I I)}(k, n)$ of the second kind.

| $k \backslash n$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 0 | $r$ | $r$ | $r^{2}+r$ | $2 r^{2}+r$ | $r^{3}+3 r^{2}+r$ | $3 r^{3}+4 r^{2}+r$ | $r^{4}+6 r^{3}+5 r^{2}+r$ |
| 2 | 1 | 0 | $2 r$ | 0 | $4 r^{2}$ | 0 | $8 r^{3}$ | 0 | $16 r^{4}$ |
| 3 | 1 | 0 | $r$ | $r^{2}$ | $r^{2}$ | $2 r^{3}$ | $r^{4}+r^{3}$ | $3 r^{4}$ | $3 r^{5}+r^{4}$ |
| 4 | 1 | 0 | $r$ | 0 | $r^{3}+r^{2}$ | 0 | $2 r^{4}+r^{3}$ | 0 | $r^{6}+3 r^{5}+r^{4}$ |
| 5 | 1 | 0 | $r$ | 0 | $r^{2}$ | $r^{4}$ | $r^{3}$ | $2 r^{5}$ | $r^{4}$ |
| 6 | 1 | 0 | $r$ | 0 | $r^{2}$ | 0 | $r^{5}+r^{3}$ | 0 | $2 r^{6}+r^{4}$ |
| 7 | 1 | 0 | $r$ | 0 | $r^{2}$ | 0 | $r^{3}$ | $r^{6}$ | $r^{4}$ |

with initial conditions

$$
\begin{align*}
& F_{r}^{(\mathrm{III})}(1,1)=2, \\
& F_{r}^{(\mathrm{III})}(k, n)= \begin{cases}r^{n / 2} & \text { for even } n, \\
2 r^{[n / 2]} & \text { for odd } n,\end{cases}  \tag{9}\\
& F_{r}^{\text {(III) }}(k, k)= \begin{cases}r^{k-1}+r^{k / 2} & \text { for even } k, \\
r^{k-1}+2 r^{[k / 2]} & \text { for odd } k \geq 3 .\end{cases}
\end{align*}
$$

For $r=1$ we get $F_{1}^{(\mathrm{III})}(k, n)=F_{2}^{(3)}(k, n)$. These numbers were introduced in [11]. For $r=1, k=1$, and $n \geq 0$ we have $F_{1}^{(\mathrm{III})}(1, n)=F_{n+1}$. Moreover, for $r=1, k=4$, and $n \geq 1 F_{1}^{(\text {III })}(4,2 n)=F_{n}$.

Table 3 includes a few initial words of distance $F_{r}^{(\text {III })}(k, n)$ for special values of $k$ and $n$.

By the definition of distance ( $r, k$ )-Fibonacci numbers of three kinds we get for $k \geq 1$ and $n \geq 0$ the following relations:

$$
\begin{align*}
F_{r}^{(\text {III })}(k, n) & =2 F_{r}^{\text {(I) }}(k, n) \quad \text { for even } k \text { and odd } n, \\
F_{r}^{(\mathrm{II})}(k, n) & =F_{r}^{\text {(II) }}(k, n)=F_{r}^{\text {(III })}(k, n) \tag{10}
\end{align*}
$$

for even $k$ and even $n$,

$$
F_{r}^{(\mathrm{II})}(k, n)=0 \quad \text { for even } k \text { and odd } n .
$$

## 3. Combinatorial and Graph Interpretations of Distance ( $r, k$ )-Fibonacci Numbers

In this section we present some combinatorial and graph interpretations of distance ( $r, k$ )-Fibonacci numbers. The classical Fibonacci numbers have many combinatorial interpretations. One of them is the interpretation related to set decomposition. We recall it. Let $X=\{1,2, \ldots, n\}, n \geq 1$, and $\mathscr{Y}^{\star}=\left\{Y_{t}^{\star}: t \in T\right\}$ be a family of disjoint subsets of $X$ such that
(1) $\left|Y_{t}^{\star}\right| \in\{1,2\}$,
(2) if $\left|Y_{t}^{\star}\right|=2$ then $Y_{t}^{\star}$ contains two consecutive integers,
(3) $X \backslash \bigcup_{t \in T} Y_{t}^{\star}=\emptyset$.

It is well known that the number of all families $\mathscr{Y}^{\star}$ is equal to the classical Fibonacci numbers $F_{n}$. We introduce analogous interpretation of distance $(r, k)$-Fibonacci numbers.

Let $r \geq 1$ and $X=\{1,2, \ldots, n\}, n \geq 2$, be the set of $n$ integers. Let $k \geq 3$. Assume that $\mathscr{R}_{n}$ is a multifamily of twoelement subsets of $X$ such that

$$
\begin{align*}
& \mathscr{R}_{n}=\{\underbrace{\{1,2\},\{1,2\}, \ldots,\{1,2\}}_{r \text {-times }}, \underbrace{\{2,3\}, \ldots,\{2,3\}}_{r \text {-times }}, \ldots,  \tag{11}\\
& \underbrace{\{n-1, n\}, \ldots,\{n-1, n\}}_{r \text {-times }}\} .
\end{align*}
$$

For fixed $t, 1 \leq t \leq n-k$ by $\mathscr{R}(k, t)$ we denote a subfamily of $\mathscr{R}_{n}$ such that $\mathscr{R}(k, t)=\{\{t+j, t+j+1\}: j=0,1, \ldots, k-$ $2, t=1,2, \ldots, n-k+1\}$. Analogously for fixed $t^{\prime}$ we define $\mathscr{R}\left(k, t^{\prime}\right)=\{\{t, t+1\}: t=1,2, \ldots, n-1\}$.

Let $\mathscr{R}_{t, t^{\prime}}^{(j)}, j=1,2,3$, be a subfamily of $\mathscr{R}_{n}$ such that $\mathscr{R}_{t, t^{\prime}}^{(j)}=$ $\mathscr{R}(k, t) \cup \mathscr{R}\left(k, t^{\prime}\right)$ and
(a) for each $R\left(k, t_{1}^{\prime}\right), R\left(k, t_{2}^{\prime}\right) \in \mathscr{R}\left(k, t^{\prime}\right), t_{1}^{\prime} \neq t_{2}^{\prime}$ holds $\mid t_{1}^{\prime}-$ $t_{2}^{\prime} \mid \geq 2$, for each $R\left(k, t_{1}\right), R\left(k, t_{2}\right) \in \mathscr{R}(k, t), t_{1} \neq t_{2}$, holds $\left|t_{1}-t_{2}\right| \geq k$,
(b) for each $R_{t} \in \mathscr{R}_{t, t^{\prime}}^{(j)}$ holds $\left|R_{t}\right| \in\{2, k\}$ for $t \in T$
and exactly one of the following conditions for $R_{t} \in \mathscr{R}_{t, t^{\prime}}^{(j)}$ and $j=$ I, II, III, respectively, is satisfied:
(c1) $X \backslash \bigcup_{t \in T} R_{t}=\emptyset$ or $X \backslash \bigcup_{t \in T} R_{t}=\{n\}$,
(c2) $X \backslash \bigcup_{t \in T} R_{t}=\emptyset$,
(c3) $\left|X \backslash \bigcup_{t \in T} R_{t}\right| \in\{0,1\}$ and if $p \in X \backslash \bigcup_{t \in T} R_{t}$ then either $p=1$ or $p=n$.

Assume that the condition (cl) is satisfied. Then the subfamily $\mathscr{R}_{t, t^{\prime}}^{(1)}$ we will call a decomposition with repetitions of the set $X$ with the rest at the end.

Assume that the condition (c2) is satisfied. Then the subfamily $\mathscr{R}_{t, t^{\prime}}^{(2)}$ we will call a perfect decomposition with repetitions of the set $X$.

Assume that the condition (c3) is satisfied. Then the subfamily $\mathscr{R}_{t, t^{\prime}}^{(3)}$ we will call a decomposition with repetitions of the set $X$ with the rest at the end or at the beginning.

Theorem 1. Let $k \geq 3, n \geq 2$, and $r \geq 1$ be integers. Then the number of all decompositions with repetitions of the set $X$ with the rest at the end is equal to the number $F_{r}^{(I)}(k, n)$.

Table 3: Distance $(r, k)$-Fibonacci numbers $F_{r}^{(I I I)}(k, n)$ of the third kind.

| $k \backslash n$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 2 | $r+2$ | $3 r+2$ | $r^{2}+5 r+2$ | $4 r^{2}+7 r+2$ | $r^{3}+9 r^{2}+9 r+2$ | $5 r^{3}+9 r^{2}+16 r+4$ | $r^{4}+14 r^{3}+18 r^{2}+18 r+4$ |
| 2 | 1 | 2 | $2 r$ | $4 r$ | $4 r^{2}$ | $8 r^{2}$ | $8 r^{3}$ | $16 r^{3}$ | $16 r^{4}$ |
| 3 | 1 | 2 | $r$ | $r^{2}+2 r$ | $3 r^{2}$ | $2 r^{3}+2 r^{2}$ | $r^{4}+5 r^{3}$ | $5 r^{4}+2 r^{3}$ | $3 r^{5}+7 r^{4}$ |
| 4 | 1 | 2 | $r$ | $2 r$ | $r^{3}+r^{2}$ | $2 r^{3}+2 r^{2}$ | $2 r^{4}+r^{3}$ | $4 r^{4}+2 r^{3}$ | $r^{2}+3 r^{5}+r^{4}$ |
| 5 | 1 | 2 | $r$ | $2 r$ | $r^{2}$ | $r^{4}+2 r^{2}$ | $2 r^{4}+r^{3}$ | $2 r^{5}+2 r^{3}$ | $4 r^{5}+r^{4}$ |
| 6 | 1 | 2 | $r$ | $2 r$ | $r^{2}$ | $2 r^{2}$ | $r^{5}+r^{3}$ | $2 r^{5}+2 r^{3}$ | $2 r^{6}+r^{4}$ |
| 7 | 1 | 2 | $r$ | $2 r$ | $r^{2}$ | $2 r^{2}$ | $r^{3}$ | $r^{6}+2 r^{3}$ | $2 r^{6}+2 r^{4}$ |

Proof (induction on $n$ ). Let $k \geq 3, n \geq 2$, and $r \geq 1$ be integers. Let $X=\{1,2, \ldots, n\}$. Denote by $d(n)$ the number of all decompositions with repetitions of $X$ with the rest at the end. Let $n=2$. Then it is easily seen that there are exactly $r$ decompositions of $X$. Thus we get $d(2)=r=F_{r}^{(\mathrm{I})}(k, 2)$. Let $n \geq 3$. Assume that equality $d(n)=F_{r}^{(\mathrm{I})}(k, n)$ holds for an arbitrary $n$. We will show that $d(n+1)=F_{r}^{(\mathrm{I})}(k, n+1)$.

Let $d^{2}(n+1)$ and $d^{k}(n+1)$ denote the number of all decompositions $R$ with repetitions of the set $X=\{1,2, \ldots, n+$ $1\}$ with the rest at the end such that $\{1,2\} \in R$ and $\{1,2, \ldots, k\} \in R$, respectively. It is easily seen that

$$
\begin{equation*}
d(n+1)=d^{2}(n+1)+d^{k}(n+1) \tag{12}
\end{equation*}
$$

Moreover, we get

$$
\begin{align*}
& d^{2}(n+1)=d^{k}(n-1) \\
& d^{k}(n+1)=d^{k}(n+1-k) \tag{13}
\end{align*}
$$

By the induction hypothesis and by recurrence (4) we obtain

$$
\begin{align*}
d(n+1) & =d(n-1)+d(n+1-k) \\
& =F_{r}^{(\mathrm{I})}(k, n-1)+F_{r}^{(\mathrm{I})}(k, n+1-k)  \tag{14}\\
& =F_{r}^{(\mathrm{I})}(k, n+1)
\end{align*}
$$

which ends the proof.
Analogously as Theorem 1 we can prove the following.
Theorem 2. Let $k \geq 3, n \geq 2$, and $r \geq 1$ be integers. Then the number of all perfect decompositions with repetitions of the set $X$ is equal to the number $F_{r}^{(I I)}(k, n)$.

Theorem 3. Let $k \geq 3, n \geq 2$, and $r \geq 1$ be integers. Then the number of all decompositions with repetitions of the set $X$ with the rest at the end or at the beginning is equal to the number $F_{r}^{(I I I)}(k, n)$.

Distance ( $r, k$ )-Fibonacci numbers of three kinds have a graph interpretation, too. It is connected with $k$-distance $H$ matchings in graphs. We recall the definition of a $k$-distance $H$-matching. Let $G$ and $H$ be any two graphs, let $k \geq 1$ be an integer, and a $k$-distance $H$-matching $M$ of $G$ is a subgraph of $G$ such that all connected components of $M$ are isomorphic
to $H$ and for each two components $H_{1}$ and $H_{2}$ from $M$ for each $x \in V\left(H_{1}\right)$ and $y \in V\left(H_{2}\right)$ holds $d_{G}(x, y) \geq k$. In case of $k=1$ and $H=K_{2}$ we obtain the definition of matching in classical sense. If $M$ covers the set $V(G)$ (i.e., $V(M)=V(G)$ ), then we say that $M$ is a perfect matching of $G$. For $k=2$ and $H=K_{1}$ the definition of $k$-distance $H$-matchings reduces to the definition of an independent set of a graph $G$. In the literature the generalization of H -matching of a graph G is considered, too. For a given collection $\mathscr{H}=H_{1}, H_{2}, \ldots, H_{n}$ of graphs a $\mathscr{H}$-matching $\mathscr{M}$ of $G$ is a family of subgraphs of $G$ such that each connected component of $\mathscr{M}$ is isomorphic to some $H_{i}, 1 \leq i \leq n$. Moreover, the empty set is a $\mathscr{H}$-matching of $G$, too. If $H_{i}=H$ for all $i=1,2, \ldots, n$, then we obtain the definition of $H$-matching.

Among $\mathscr{H}$-matchings we consider such $\mathscr{H}$-matchings, where $H_{i}, i=1,2, \ldots, n$, belong to the same class of graphs, namely, 2 -vertex or $k$-vertex paths ( $P_{2}$ and $P_{k}$, resp.), $k \geq 3$.

Consider a multipath $P_{n}^{r}$, where $n \geq 2, r \geq 1, V\left(P_{n}^{r}\right)=$ $\left\{x_{1}, x_{2}, \ldots, x_{n}\right\}$, and

$$
\begin{gather*}
E\left(P_{n}^{r}\right)=\{\underbrace{\left\{x_{1}, x_{2}\right\}, \ldots,\left\{x_{1}, x_{2}\right\}}_{r \text {-times }}, \\
\underbrace{\left\{x_{2}, x_{3}\right\}, \ldots,\left\{x_{2}, x_{3}\right\}, \ldots,}_{r \text {-times }} \tag{15}
\end{gather*}
$$

$$
\underbrace{\left\{x_{n-1}, x_{n}\right\}, \ldots,\left\{x_{n-1}, x_{n}\right\}}_{r \text {-times }}\} .
$$

Let $n \geq 2, k \geq 3$, and $r \geq 1$ be integers. In the graph terminology the number $F_{r}^{(\mathrm{I})}(k, n)$ is equal to the number of special $\left\{P_{2}, P_{k}\right\}$-matchings $M$ of the multipath $P_{n}^{r}$ such that at most one vertex, namely, $x_{n}$, does not belong to a $\left\{P_{2}, P_{k}\right\}$ matching of the graph $P_{n}^{r}$. We will call such matchings $M$ a quasi-perfect matching of $P_{n}^{r}$. The number $F_{r}^{(\mathrm{II})}(k, n)$ is equal to the number of such $\left\{P_{2}, P_{k}\right\}$-matchings of $P_{n}^{r}$ that both vertex $x_{1}$ and vertex $x_{n}$ belong to some $\left\{P_{2}, P_{k}\right\}$-matchings $M$ and $M^{\prime}$, respectively, of the graph $P_{n}^{r}$. In other words the number $F_{r}^{(\mathrm{II})}(k, n)$ is equal to all perfect $\left\{P_{2}, P_{k}\right\}$-matchings $M$ of the graph $P_{n}^{r}$.

The number $F_{r}^{(\text {III })}(k, n)$ is equal to the number of special $\left\{P_{k}, P_{2}\right\}$-matchings of the multipath $P_{n}^{r}$ such that at most one vertex either vertex $x_{1}$ or $x_{n}$ does not belong to a $\left\{P_{2}, P_{k}\right\}$ matching of the graph $P_{n}^{r}$.

Let $\sigma\left(P_{n}^{r}\right)$ be the number of all perfect $\left\{P_{2}, P_{k}\right\}$-matchings $M$ of the graph $P_{n}^{r}$.

Theorem 4. Let $r \geq 1, k \geq 3$, and $n \geq 2$ be integers. Then $\sigma\left(P_{n}^{r}\right)=F_{r}^{(I I)}(k, n)$.

Proof. Consider a multipath $P_{n}^{r}$ where vertices from $V\left(P_{n}^{r}\right)=$ $\left\{x_{1}, x_{2}, \ldots, x_{n}\right\}$ are numbered in the natural fashion. Let $\sigma_{k}(n)$ and $\sigma_{2}(n)$ be the number of perfect $\left\{P_{2}, P_{k}\right\}$-matchings $M$ of $P_{n}^{r}$ such that $x_{n}, x_{n-1} \in V(M)$ and $x_{n}, x_{n-1}, \ldots, x_{n-k} \in V(M)$, respectively. It is easily seen that $\sigma_{k}(n)+\sigma_{2}(n)=\sigma\left(P_{n}^{r}\right)$.

Let $M$ be an arbitrary perfect $\left\{P_{2}, P_{k}\right\}$-matching of $P_{n}^{r}, k \geq$ 3. Consider two cases:
(1) $\left\{x_{n-1}, x_{n}\right\} \in E\left(P_{k}\right)$, where $P_{k} \in M$.

Then we can choose the edge $\left\{x_{n-1}, x_{n}\right\}$ on $r$ ways. Moreover, $M=M^{\prime} \cup\left\{P_{k}\right\}$, where $M^{\prime}$ is an arbitrary $\left\{P_{2}, P_{k}\right\}$ matching of the graph $P_{n}^{r} \backslash\left\{x_{n}, x_{n-1}, \ldots, x_{n-k+1}\right\}$ which is isomorphic to the multipath $P_{n-k}^{r}$. Hence $\sigma_{k}(n)=r^{k-1} \sigma\left(P_{n-k}^{r}\right)$.
(2) $\left\{x_{n-1}, x_{n}\right\} \in E\left(P_{2}\right)$, where $P_{2} \in M$.

Proving analogously as in case (1) we obtain $\sigma_{2}(n)=$ $r \sigma\left(P_{n-2}^{r}\right)$.

Consequently

$$
\begin{equation*}
\sigma\left(P_{n}^{r}\right)=\sigma_{k}(n)+\sigma_{2}(n)=r^{k-1} \sigma\left(P_{n-k}^{r}\right)+r \sigma\left(P_{n-2}^{r}\right) . \tag{16}
\end{equation*}
$$

Claim

$$
\begin{equation*}
\sigma\left(P_{n}^{r}\right)=r^{k-1} F_{r}^{(\mathrm{II})}(k, n-k)+r F_{r}^{(\mathrm{II})}(k, n-2) . \tag{17}
\end{equation*}
$$

Proof. Assume now that the set $X=\{1,2, \ldots, n\}$ corresponds to $V\left(P_{n}^{r}\right)$ with the numbering in the natural fashion. Let $\mathscr{R}\left(t, t^{\prime}\right)=\left\{R_{t}: t \in T\right\} \cup\left\{R_{t}^{\prime}: t^{\prime} \in T\right\}$ be a multifamily of $X$ which gives a perfect decomposition of the set $X$. Then every $R_{t}$ and $R_{t^{\prime}}$ correspond to subgraph $P_{\left|R_{t}\right|}$ and $P_{\left|R_{t}^{\prime}\right|}$ for $t, t^{\prime} \in T$, respectively, of $P_{n}^{r}$. By Theorem 2 we get

$$
\begin{align*}
\sigma\left(P_{n}^{r}\right) & =\sigma_{k}(n)+\sigma_{2}(n) \\
& =r^{k-1} F_{r}^{(\mathrm{II})}(k, n-k)+r F_{r}^{(\mathrm{II})}(k, n-2) . \tag{18}
\end{align*}
$$

Moreover, by (6) we obtain $\sigma\left(P_{n}^{r}\right)=F_{r}^{(\mathrm{II})}(k, n)$, which ends the proof.

Analogously we can prove combinatorial interpretations of numbers $F_{r}^{(\mathrm{I})}(k, n)$ and $F_{r}^{(\mathrm{III})}(k, n)$.

## 4. Identities for Distance ( $r, k$ )-Fibonacci Numbers

In this section we give some identities and some relations between distance ( $r, k$ )-Fibonacci numbers of three types.

Theorem 5. For $k \geq 1, n \geq 2 k-2$, and $j=I, I I, I I I$,

$$
\begin{align*}
F_{r}^{(j)}(k, n)= & r F_{r}^{(j)}(k, n-2)+r^{k-2} F_{r}^{(j)}(k, n-k+2) \\
& -r^{2 k-3} F_{r}^{(j)}(k, n-2 k+2) . \tag{19}
\end{align*}
$$

Proof. We give the proof for distance ( $r, k$ )-Fibonacci numbers of the first kind. By the definition of numbers $F_{r}^{(\mathrm{I})}(k, n)$, we have

$$
\begin{align*}
& r F_{r}^{(\mathrm{I})}(k, n-2)+r^{k-2} F_{r}^{(\mathrm{I})}(k, n-k+2) \\
& \quad-r^{2 k-3} F_{r}^{(\mathrm{I})}(k, n-2 k+2)=r F_{r}^{(\mathrm{I})}(k, n-2) \\
& \quad+r^{k-2}\left(r F_{r}^{(\mathrm{I})}(k, n-k)+r^{k-1} F_{r}^{(\mathrm{I})}(k, n-2 k+2)\right)  \tag{20}\\
& \quad-r^{2 k-3} F_{r}^{(\mathrm{I})}(k, n-2 k+2)=r F_{r}^{(\mathrm{I})}(k, n-2) \\
& \quad+r^{k-1} F_{2}^{(\mathrm{I})}(k, n-k)=F_{r}^{(\mathrm{I})}(k, n)
\end{align*}
$$

which ends the proof.
Corollary 6. For $n \geq 2 F_{n}=(1 / 2)\left(F_{n-2}+F_{n+1}\right)$.
Proof. For $r=1, j=\mathrm{I}$, and $k=1$ by (19) we obtain

$$
\begin{equation*}
F_{1}^{(\mathrm{I})}(1, n)=F_{n}=F_{n-2}+F_{n+1}-F_{n} . \tag{21}
\end{equation*}
$$

Hence

$$
\begin{equation*}
F_{n}=\frac{1}{2}\left(F_{n-2}+F_{n+1}\right) . \tag{22}
\end{equation*}
$$

Theorem 7. For $r \geq 1, k \geq 2$, and $n \geq 1$,

$$
\begin{equation*}
F_{r}^{(I)}(k, n)=F_{r}^{(I I)}(k, n)+F_{r}^{(I I)}(k, n-1) . \tag{23}
\end{equation*}
$$

Proof (induction on $n$ ). For $n=1$ we have

$$
\begin{equation*}
F_{r}^{(\mathrm{I})}(k, 1)=1=F_{r}^{(\mathrm{II})}(k, 1)+F_{r}^{(\mathrm{II})}(k, 0) . \tag{24}
\end{equation*}
$$

Assume that equality (23) is true for an arbitrary $n$. We will prove it for $n+1$. By the recurrence (6) and by induction hypothesis we get

$$
\begin{align*}
F_{r}^{(\mathrm{I})} & (k, n+1) \\
= & r F_{r}^{(\mathrm{I})}(k, n-1)+r^{k-1} F_{r}^{(\mathrm{I})}(k, n+1-k) \\
= & r\left(F_{r}^{(\mathrm{II})}(k, n-1)+F_{r}^{\mathrm{II})}(k, n-2)\right) \\
& +r^{k-1}\left(F_{r}^{\mathrm{II})}(k, n+1-k)+F_{r}^{(\mathrm{II})}(k, n-k)\right)  \tag{25}\\
= & r F_{r}^{(\mathrm{II})}(k, n-1)+r^{k-1} F_{r}^{\mathrm{III})}(k, n+1-k) \\
& +r F_{r}^{(\mathrm{II})}(k, n-2)+r^{k-1} F_{2}^{(\mathrm{II})}(k, n-k) \\
= & F_{r}^{(\mathrm{II})}(k, n+1)+F_{r}^{\mathrm{II})}(k, n),
\end{align*}
$$

which ends the proof.
Analogously we can prove the following.
Theorem 8. For $r \geq 1, k \geq 3$, and $n \geq 0$,

$$
\begin{equation*}
2 F_{r}^{(I)}(k, n)=F_{r}^{(I I)}(k, n)+F_{r}^{(I I I)}(k, n) \tag{26}
\end{equation*}
$$

Theorem 9. For $r \geq 1, k \geq 2, n \geq 2 k$, and $j=I, I I, I I I$,

$$
\begin{align*}
F_{r}^{(j)}(k, n)= & r^{2} F_{r}^{(j)}(k, n-4)+2 r^{k} F_{r}^{(j)}(k, n-k-2) \\
& +r^{2 k-2} F_{r}^{(j)}(k, n-2 k) \tag{27}
\end{align*}
$$

## Conflict of Interests

The author declares that there is no conflict of interests regarding the publication of this paper.
