

A finite-dimensional Lie algebra arising from a Nichols algebra of diagonal type (rank 2)*

Nicolás Andruskiewitsch Iván Angiono
Fiorela Rossi Bertone

Abstract

Let \mathcal{B}_q be a finite-dimensional Nichols algebra of diagonal type corresponding to a matrix $q \in \mathbf{k}^{\theta \times \theta}$. Let \mathcal{L}_q be the Lusztig algebra associated to \mathcal{B}_q [AAR]. We present \mathcal{L}_q as an extension (as braided Hopf algebras) of \mathcal{B}_q by \mathfrak{Z}_q where \mathfrak{Z}_q is isomorphic to the universal enveloping algebra of a Lie algebra \mathfrak{n}_q . We compute the Lie algebra \mathfrak{n}_q when $\theta = 2$.

1 Introduction

1.1 Let \mathbf{k} be a field, algebraically closed and of characteristic zero. Let $\theta \in \mathbb{N}$, $\mathbb{I} = \mathbb{I}_\theta := \{1, 2, \dots, \theta\}$. Let $q = (q_{ij})_{i,j \in \mathbb{I}}$ be a matrix with entries in \mathbf{k}^\times , V a vector space with a basis $(x_i)_{i \in \mathbb{I}}$ and $c^q \in GL(V \otimes V)$ be given by

$$c^q(x_i \otimes x_j) = q_{ij} x_j \otimes x_i, \quad i, j \in \mathbb{I}.$$

Then $(c^q \otimes \text{id})(\text{id} \otimes c^q)(c^q \otimes \text{id}) = (\text{id} \otimes c^q)(c^q \otimes \text{id})(\text{id} \otimes c^q)$, i.e. (V, c^q) is a braided vector space and the corresponding Nichols algebra $\mathcal{B}_q := \mathcal{B}(V)$ is called of diagonal type. Recall that \mathcal{B}_q is the image of the unique map of braided Hopf algebras $\Omega : T(V) \rightarrow T^c(V)$ from the free associative algebra of V to the free associative coalgebra of V , such that $\Omega|_V = \text{id}_V$. For unexplained terminology and notation, we refer to [AS].

Remarkably, the explicit classification of all \mathfrak{q} such that $\dim \mathcal{B}_{\mathfrak{q}} < \infty$ is known [H2] (we recall the list when $\theta = 2$ in Table 1). Also, for every \mathfrak{q} in the list of [H2], the defining relations are described in [A2, A3].

1.2 Assume that $\dim \mathcal{B}_{\mathfrak{q}} < \infty$. Two infinite dimensional graded braided Hopf algebras $\tilde{\mathcal{B}}_{\mathfrak{q}}$ and $\mathcal{L}_{\mathfrak{q}}$ (the Lusztig algebra of V) were introduced and studied in [A3, A5], respectively [AAR]. Indeed, $\tilde{\mathcal{B}}_{\mathfrak{q}}$ is a pre-Nichols, and $\mathcal{L}_{\mathfrak{q}}$ a post-Nichols, algebra of V , meaning that $\tilde{\mathcal{B}}_{\mathfrak{q}}$ is intermediate between $T(V)$ and $\mathcal{B}_{\mathfrak{q}}$, while $\mathcal{L}_{\mathfrak{q}}$ is intermediate between $\mathcal{B}_{\mathfrak{q}}$ and $T^c(V)$. This is summarized in the following commutative diagram:

$$\begin{array}{ccccc}
 & & \Omega & & \\
 & \curvearrowright & & \curvearrowleft & \\
 T(V) & \xrightarrow{\quad} & \mathcal{B}_{\mathfrak{q}} & \xrightarrow{\quad} & T^c(V) \\
 & \searrow & \nearrow^{\pi} & \searrow & \nearrow \\
 & & \tilde{\mathcal{B}}_{\mathfrak{q}} & & \mathcal{L}_{\mathfrak{q}}
 \end{array}$$

The algebras $\tilde{\mathcal{B}}_{\mathfrak{q}}$ and $\mathcal{L}_{\mathfrak{q}}$ are generalizations of the positive parts of the De Concini-Kac-Proceti quantum group, respectively the Lusztig quantum divided powers algebra. The distinguished pre-Nichols algebra $\tilde{\mathcal{B}}_{\mathfrak{q}}$ is defined discarding some of the relations in [A3], while $\mathcal{L}_{\mathfrak{q}}$ is the graded dual of $\tilde{\mathcal{B}}_{\mathfrak{q}}$.

1.3 The following notions are discussed in Section 2. Let $\Delta_+^{\mathfrak{q}}$ be the generalized positive root system of $\mathcal{B}_{\mathfrak{q}}$ and let $\mathfrak{D}_{\mathfrak{q}} \subset \Delta_+^{\mathfrak{q}}$ be the set of Cartan roots of \mathfrak{q} . Let x_{β} be the root vector associated to $\beta \in \Delta_+^{\mathfrak{q}}$, let $N_{\beta} = \text{ord } q_{\beta\beta}$ and let $Z_{\mathfrak{q}}$ be the subalgebra of $\tilde{\mathcal{B}}_{\mathfrak{q}}$ generated by $x_{\beta}^{N_{\beta}}$, $\beta \in \mathfrak{D}_{\mathfrak{q}}$. By [A5, Theorems 4.10, 4.13], $Z_{\mathfrak{q}}$ is a braided normal Hopf subalgebra of $\tilde{\mathcal{B}}_{\mathfrak{q}}$ and $Z_{\mathfrak{q}} = {}^{\text{co } \pi} \tilde{\mathcal{B}}_{\mathfrak{q}}$. Actually, $Z_{\mathfrak{q}}$ is a true commutative Hopf algebra provided that

$$q_{\alpha\beta}^{N_{\beta}} = 1, \quad \forall \alpha, \beta \in \mathfrak{D}_{\mathfrak{q}}. \quad (1)$$

Let $\mathfrak{Z}_{\mathfrak{q}}$ be the graded dual of $Z_{\mathfrak{q}}$; under the assumption (1) $\mathfrak{Z}_{\mathfrak{q}}$ is a cocommutative Hopf algebra, hence it is isomorphic to the enveloping algebra $\mathcal{U}(\mathfrak{n}_{\mathfrak{q}})$ of the Lie algebra $\mathfrak{n}_{\mathfrak{q}} := \mathcal{P}(\mathfrak{Z}_{\mathfrak{q}})$. We show in Section 3 that $\mathcal{L}_{\mathfrak{q}}$ is an extension (as braided Hopf algebras) of $\mathcal{B}_{\mathfrak{q}}$ by $\mathfrak{Z}_{\mathfrak{q}}$:

$$\mathcal{B}_{\mathfrak{q}} \xrightarrow{\pi^*} \mathcal{L}_{\mathfrak{q}} \xrightarrow{\iota^*} \mathfrak{Z}_{\mathfrak{q}}. \quad (2)$$

The main result of this paper is the determination of the Lie algebra $\mathfrak{n}_{\mathfrak{q}}$ when $\theta = 2$ and the generalized Dynkin diagram of \mathfrak{q} is connected.

Theorem 1.1. *Assume that $\dim \mathcal{B}_{\mathfrak{q}} < \infty$ and $\theta = 2$. Then $\mathfrak{n}_{\mathfrak{q}}$ is either 0 or isomorphic to \mathfrak{g}^+ , where \mathfrak{g} is a finite-dimensional semisimple Lie algebra listed in the last column of Table 1.*

Assume that there exists a Cartan matrix $\mathbf{a} = (a_{ij})$ of finite type, that becomes symmetric after multiplying with a diagonal (d_i) , and a root of unit q of odd order (and relatively prime to 3 if \mathbf{a} is of type G_2) such that $q_{ij} = q^{d_i a_{ij}}$ for all $i, j \in \mathbb{I}$. Then (2) encodes the quantum Frobenius homomorphism defined by Lusztig and Theorem 1.1 is a result from [L].

The penultimate column of Table 1 indicates the type of \mathfrak{q} as established in [AA]. Thus, we associate Lie algebras in characteristic zero to some contragredient Lie (super)algebras in positive characteristic. In a forthcoming paper we shall compute the Lie algebra $\mathfrak{n}_{\mathfrak{q}}$ for $\theta > 2$.

1.4 The paper is organized as follows. We collect the needed preliminary material in Section 2. Section 3 is devoted to the exactness of (2). The computations of the various $\mathfrak{n}_{\mathfrak{q}}$ is the matter of Section 4. We denote by \mathbb{G}_N the group of N -th roots of 1, and by \mathbb{G}'_N its subset of primitive roots.

2 Preliminaries

2.1 The Nichols algebra, the distinguished-pre-Nichols algebra and the Lusztig algebra

Let \mathfrak{q} be as in the Introduction and let $(V, c^{\mathfrak{q}})$ be the corresponding braided vector space of diagonal type. We assume from now on that $\mathcal{B}_{\mathfrak{q}}$ is finite-dimensional. Let $(\alpha_j)_{j \in \mathbb{I}}$ be the canonical basis of \mathbb{Z}^{θ} . Let $\mathbf{q} : \mathbb{Z}^{\theta} \times \mathbb{Z}^{\theta} \rightarrow \mathbf{k}^{\times}$ be the \mathbb{Z} -bilinear form associated to the matrix \mathfrak{q} , i.e. $\mathbf{q}(\alpha_j, \alpha_k) = q_{jk}$ for all $j, k \in \mathbb{I}$. If $\alpha, \beta \in \mathbb{Z}^{\theta}$, we set $q_{\alpha\beta} = \mathbf{q}(\alpha, \beta)$. Consider the matrix $(c_{ij}^{\mathfrak{q}})_{i,j \in \mathbb{I}}$, $c_{ij}^{\mathfrak{q}} \in \mathbb{Z}$ defined by $c_{ii}^{\mathfrak{q}} = 2$,

$$c_{ij}^{\mathfrak{q}} := -\min \{n \in \mathbb{N}_0 : (n+1)_{q_{ii}}(1 - q_{ii}^n q_{ij} q_{ji}) = 0\}, \quad i \neq j. \quad (3)$$

This is well-defined by [R]. Let $i \in \mathbb{I}$. We recall the following definitions:

- ◇ The reflection $s_i^{\mathfrak{q}} \in GL(\mathbb{Z}^{\theta})$, given by $s_i^{\mathfrak{q}}(\alpha_j) = \alpha_j - c_{ij}^{\mathfrak{q}} \alpha_i$, $j \in \mathbb{I}$.
- ◇ The matrix $\rho_i(\mathfrak{q})$, given by $\rho_i(\mathfrak{q})_{jk} = \mathbf{q}(s_i^{\mathfrak{q}}(\alpha_j), s_i^{\mathfrak{q}}(\alpha_k))$, $j, k \in \mathbb{I}$.
- ◇ The braided vector space $\rho_i(V)$ of diagonal type with matrix $\rho_i(\mathfrak{q})$.

A basic result is that $\mathcal{B}_{\mathfrak{q}} \simeq \mathcal{B}_{\rho_i(\mathfrak{q})}$, at least as graded vector spaces.

The algebras $T(V)$ and $\mathcal{B}_{\mathfrak{q}}$ are \mathbb{Z}^{θ} -graded by $\deg x_i = \alpha_i$, $i \in \mathbb{I}$. Let $\Delta_+^{\mathfrak{q}}$ be the set of \mathbb{Z}^{θ} -degrees of the generators of a PBW-basis of $\mathcal{B}_{\mathfrak{q}}$, counted with multiplicities [H1]. The elements of $\Delta_+^{\mathfrak{q}}$ are called (positive) roots. Let $\Delta^{\mathfrak{q}} = \Delta_+^{\mathfrak{q}} \cup -\Delta_+^{\mathfrak{q}}$. Let

$$\mathcal{X} := \{\rho_{j_1} \dots \rho_{j_N}(\mathfrak{q}) : j_1, \dots, j_N \in \mathbb{I}, N \in \mathbb{N}\}.$$

Then the generalized root system of \mathfrak{q} is the fibration $\Delta \rightarrow \mathcal{X}$, where the fiber of $\rho_{j_1} \dots \rho_{j_N}(\mathfrak{q})$ is $\Delta^{\rho_{j_1} \dots \rho_{j_N}(\mathfrak{q})}$. The Weyl groupoid of $\mathcal{B}_{\mathfrak{q}}$ is a groupoid, denoted $\mathcal{W}_{\mathfrak{q}}$,

Table 1: Lie algebras arising from Dynkin diagrams of rank 2.

that acts on this fibration, generalizing the classical Weyl group, see [H1]. We know from *loc. cit.* that \mathcal{W}_q is finite (and this characterizes finite-dimensional Nichols algebras of diagonal type).

Here is a useful description of Δ_+^q . Let $w \in \mathcal{W}_q$ be an element of maximal length. We fix a reduced expression $w = \sigma_{i_1}^q \sigma_{i_2} \cdots \sigma_{i_M}$. For $1 \leq k \leq M$ set

$$\beta_k = s_{i_1}^q \cdots s_{i_{k-1}}(\alpha_{i_k}), \quad (4)$$

Then $\Delta_+^q = \{\beta_k | 1 \leq k \leq M\}$ [CH, Prop. 2.12]; in particular $|\Delta_+^q| = M$.

The notion of Cartan root is instrumental for the definitions of $\tilde{\mathcal{B}}_q$ and \mathcal{L}_q . First, following [A5] we say that $i \in \mathbb{I}$ is a *Cartan vertex* of q if

$$q_{ij}q_{ji} = q_{ii}^{c_{ij}^q}, \quad \text{for all } j \neq i, \quad (5)$$

Then the set of *Cartan roots* of q is

$$\mathfrak{D}_q = \{s_{i_1}^q s_{i_2} \cdots s_{i_k}(\alpha_i) \in \Delta_+^q : i \in \mathbb{I} \text{ is a Cartan vertex of } \rho_{i_k} \cdots \rho_{i_2} \rho_{i_1}(q)\}.$$

Given a positive root $\beta \in \Delta_+^q$, there is an associated root vector $x_\beta \in \mathcal{B}_q$ defined via the so-called Lusztig isomorphisms [H3]. Set $N_\beta = \text{ord } q_{\beta\beta} \in \mathbb{N}$, $\beta \in \Delta_+^q$. Also, for $\mathbf{h} = (h_1, \dots, h_M) \in \mathbb{N}_0^M$ we write

$$x^{\mathbf{h}} = x_{\beta_M}^{h_M} x_{\beta_{M-1}}^{h_{M-1}} \cdots x_{\beta_1}^{h_1}.$$

Let $\tilde{N}_k = \begin{cases} N_{\beta_k} & \text{if } \beta_k \notin \mathcal{O}_q, \\ \infty & \text{if } \beta_k \in \mathcal{O}_q. \end{cases}$ For simplicity, we introduce

$$\mathbb{H} = \{\mathbf{h} \in \mathbb{N}_0^M : 0 \leq h_k < \tilde{N}_k, \text{ for all } k \in \mathbb{I}_M\}. \quad (6)$$

By [A5, Theorem 3.6] the set $\{x^{\mathbf{h}} | \mathbf{h} \in \mathbb{H}\}$ is a basis of $\tilde{\mathcal{B}}_q$.

As said in the Introduction, the Lusztig algebra associated to \mathcal{B}_q is the braided Hopf algebra \mathcal{L}_q which is the graded dual of $\tilde{\mathcal{B}}_q$. Thus, it comes equipped with a bilinear form $\langle \cdot, \cdot \rangle : \tilde{\mathcal{B}}_q \times \mathcal{L}_q \rightarrow \mathbf{k}$, which satisfies for all $x, x' \in \tilde{\mathcal{B}}_q, y, y' \in \mathcal{L}_q$

$$\langle y, xx' \rangle = \langle y^{(2)}, x \rangle \langle y^{(1)}, x' \rangle \quad \text{and} \quad \langle yy', x \rangle = \langle y, x^{(2)} \rangle \langle y', x^{(1)} \rangle.$$

If $\mathbf{h} \in \mathbb{H}$, then define $\mathbf{y}_{\mathbf{h}} \in \mathcal{L}_q$ by $\langle \mathbf{y}_{\mathbf{h}}, x^{\mathbf{j}} \rangle = \delta_{\mathbf{h}, \mathbf{j}}, \mathbf{j} \in \mathbb{H}$. Let $(\mathbf{h}_k)_{k \in \mathbb{I}_M}$ denote the canonical basis of \mathbb{Z}^M . If $k \in \mathbb{I}_M$ and $\beta = \beta_k \in \Delta_+^q$, then we denote the element $\mathbf{y}_{n\mathbf{h}_k}$ by $y_\beta^{(n)}$. Then the algebra \mathcal{L}_q is generated by

$$\{y_\alpha : \alpha \in \Pi_q\} \cup \{y_\alpha^{(N_\alpha)} : \alpha \in \mathfrak{D}_q, x_\alpha^{N_\alpha} \in \mathcal{P}(\tilde{\mathcal{B}}_q)\},$$

by [AAR]. Moreover, by [AAR, 4.6], the following set is a basis of \mathcal{L}_q :

$$\{y_{\beta_1}^{(h_1)} \cdots y_{\beta_M}^{(h_M)} | (h_1, \dots, h_M) \in \mathbb{H}\}.$$

2.2 Lyndon words, convex order and PBW-basis

For the computations in Section 4 we need some preliminaries on Kharchenko's PBW-basis. Let (V, \mathfrak{q}) be as above and let \mathbb{X} be the set of words with letters in $X = \{x_1, \dots, x_\theta\}$ (our fixed basis of V); the empty word is 1 and for $u \in \mathbb{X}$ we write $\ell(u)$ the length of u . We can identify $\mathbf{k}\mathbb{X}$ with $T(V)$.

Definition 2.1. Consider the lexicographic order in \mathbb{X} . We say that $u \in \mathbb{X} - \{1\}$ is a *Lyndon word* if for every decomposition $u = vw$, $v, w \in \mathbb{X} - \{1\}$, then $u < w$. We denote by L the set of all Lyndon words.

A well-known theorem, due to Lyndon, established that any word $u \in \mathbb{X}$ admits a unique decomposition, named *Lyndon decomposition*, as a non-increasing product of Lyndon words:

$$u = l_1 l_2 \dots l_r, \quad l_i \in L, l_r \leq \dots \leq l_1. \quad (7)$$

Also, each $l_i \in L$ in (7) is called a *Lyndon letter* of u .

Now each $u \in L - X$ admits at least one decomposition $u = v_1 v_2$ with $v_1, v_2 \in L$. Then the *Shirshov decomposition* of u is the decomposition $u = u_1 u_2$, $u_1, u_2 \in L$, such that u_2 is the smallest end of u between all possible decompositions of this form.

For any braided vector space V , the *braided bracket* of $x, y \in T(V)$ is

$$[x, y]_c := \text{multiplication} \circ (\text{id} - c)(x \otimes y). \quad (8)$$

Using the identification $T(V) = \mathbf{k}\mathbb{X}$ and the decompositions described above, we can define a \mathbf{k} -linear endomorphism $[-]_c$ of $T(V)$ as follows:

$$[u]_c := \begin{cases} u, & \text{if } u = 1 \text{ or } u \in X; \\ [[v]_c, [w]_c]_c, & \text{if } u \in L - X, u = vw \text{ its Shirshov decomposition;} \\ [u_1]_c \dots [u_t]_c, & \text{if } u \in \mathbb{X} - L, u = u_1 \dots u_t \text{ its Lyndon decomposition.} \end{cases}$$

We will describe PBW-bases using this endomorphism.

Definition 2.2. For $l \in L$, the element $[l]_c$ is the corresponding *hyperletter*. A word written in hyperletters is an *hyperword*; a *monotone hyperword* is an hyperword $W = [u_1]_c^{k_1} \dots [u_m]_c^{k_m}$ such that $u_1 > \dots > u_m$.

Consider now a different order on \mathbb{X} , called *deg-lex order* [K]: For each pair $u, v \in \mathbb{X}$, we have that $u \succ v$ if $\ell(u) < \ell(v)$, or $\ell(u) = \ell(v)$ and $u > v$ for the lexicographical order. This order is total, the empty word 1 is the maximal element and it is invariant by left and right multiplication.

Let I be a Hopf ideal of $T(V)$ and $R = T(V)/I$. Let $\pi : T(V) \rightarrow R$ be the canonical projection. We set:

$$G_I := \{u \in \mathbb{X} : u \notin \mathbf{k}\mathbb{X}_{\succ u} + I\}.$$

Thus, if $u \in G_I$ and $u = vw$, then $v, w \in G_I$. So, each $u \in G_I$ is a non-increasing product of Lyndon words of G_I .

Let $S_I := G_I \cap L$ and let $h_I : S_I \rightarrow \{2, 3, \dots\} \cup \{\infty\}$ be defined by:

$$h_I(u) := \min \{t \in \mathbb{N} : u^t \in \mathbf{k}\mathbb{X}_{\succ u^t} + I\}. \quad (9)$$

Theorem 2.3. [K] *The following set is a PBW-basis of $R = T(V)/I$:*

$$\{[u_1]_c^{k_1} \dots [u_m]_c^{k_m} : m \in \mathbb{N}_0, u_1 > \dots > u_m, u_i \in S_I, 0 < k_i < h_I(u_i)\}. \quad \blacksquare$$

We refer to this base as *Kharchenko's PBW-basis* of $T(V)/I$ (it depends on the order of X).

Definition 2.4. [A2, 2.6] Let Δ_q^+ be as above and let $<$ be a total order on Δ_q^+ . We say that the order is *convex* if for each $\alpha, \beta \in \Delta_q^+$ such that $\alpha < \beta$ and $\alpha + \beta \in \Delta_q^+$, then $\alpha < \alpha + \beta < \beta$. The order is called *strongly convex* if for each ordered subset $\alpha_1 \leq \alpha_2 \leq \dots \leq \alpha_k$ of elements of Δ_q^+ such that $\alpha = \sum_i \alpha_i \in \Delta_q^+$, then $\alpha_1 < \alpha < \alpha_k$.

Theorem 2.5. [A2, 2.11] *The following statements are equivalent:*

- *The order is convex.*
- *The order is strongly convex.*
- *The order arises from a reduced expression of a longest element $w \in \mathcal{W}_q$, cf. (4).* ■

Now, we have two PBW-basis of \mathcal{B}_q (and correspondingly of $\tilde{\mathcal{B}}_q$), namely Kharchenko's PBW-basis and the PBW-basis defined from a reduced expression of a longest element of the Weyl groupoid. But both basis are reconciled by [AY, Theorem 4.12], thanks to [A2, 2.14]. Indeed, each generator of Kharchenko's PBW-basis is a multiple scalar of a generator of the secondly mentioned PBW-basis. So, for ease of calculations, in the rest of this work we shall use the Kharchenko generators.

The following proposition is used to compute the hyperword $[l_\beta]_c$ associated to a root $\beta \in \Delta_q^+$:

Proposition 2.6. [A2, 2.17] *For $\beta \in \Delta_q^+$,*

$$l_\beta = \begin{cases} x_{\alpha_i}, & \text{if } \beta = \alpha_i, i \in \mathbb{I}; \\ \max\{l_{\delta_1} l_{\delta_2} : \delta_1, \delta_2 \in \Delta_q^+, \delta_1 + \delta_2 = \beta, l_{\delta_1} < l_{\delta_2}\}, & \text{if } \beta \neq \alpha_i, i \in \mathbb{I}. \end{cases} \quad \blacksquare$$

We give a list of the hyperwords appearing in the next section:

Root	Hyperword	Notation
α_i	x_i	x_i
$n\alpha_1 + \alpha_2$	$(\text{ad}_c x_1)^n x_2$	$x_{1\dots 12}$
$\alpha_1 + 2\alpha_2$	$[x_{\alpha_1 + \alpha_2}, x_2]_c$	$[x_{12}, x_2]_c$
$3\alpha_1 + 2\alpha_2$	$[x_{2\alpha_1 + \alpha_2}, x_{\alpha_1 + \alpha_2}]_c$	$[x_{112}, x_{12}]_c$
$4\alpha_1 + 3\alpha_2$	$[x_{3\alpha_1 + 2\alpha_2}, x_{\alpha_1 + \alpha_2}]_c$	$[[x_{112}, x_{12}]_c, x_{12}]_c$
$5\alpha_1 + 3\alpha_2$	$[x_{2\alpha_1 + \alpha_2}, x_{3\alpha_1 + 2\alpha_2}]_c$	$[x_{112}, [x_{112}, x_{12}]_c]_c$

We use an analogous notation for the elements of \mathcal{L}_q : for example we write $y_{112,12}$ when we refer to the element of \mathcal{L}_q which corresponds to $[x_{112}, x_{12}]_c$.

3 Extensions of braided Hopf algebras

We recall the definition of braided Hopf algebra extensions given in [AN]; we refer to [BD, GG] for more general definitions. Below we denote by $\underline{\Delta}$ the coproduct of a braided Hopf algebra A and by A^+ the kernel of the counit.

First, if $\pi : C \rightarrow B$ is a morphism of Hopf algebras in ${}^H_H\mathcal{YD}$, then we set

$$\begin{aligned} C^{\text{co}\pi} &= \{c \in C \mid (\text{id} \otimes \pi)\underline{\Delta}(c) = c \otimes 1\}, \\ {}^{\text{co}\pi}C &= \{c \in C \mid (\pi \otimes \text{id})\underline{\Delta}(c) = 1 \otimes c\}. \end{aligned}$$

Definition 3.1. [AN, §2.5] Let H be a Hopf algebra. A sequence of morphisms of Hopf algebras in ${}^H_H\mathcal{YD}$

$$\mathbf{k} \rightarrow A \xrightarrow{\iota} C \xrightarrow{\pi} B \rightarrow \mathbf{k} \quad (10)$$

is an *extension of braided Hopf algebras* if

- (i) ι is injective,
- (ii) π is surjective,
- (iii) $\ker \pi = C\iota(A^+)$ and
- (iv) $A = C^{\text{co}\pi}$, or equivalently $A = {}^{\text{co}\pi}C$.

For simplicity, we shall write $A \xrightarrow{\iota} C \xrightarrow{\pi} B$ instead of (10).

This Definition applies in our context: recall that $\mathcal{B}_q \simeq \tilde{\mathcal{B}}_q / \langle x_\beta^{N_\beta}, \beta \in \mathfrak{D}_q \rangle$. Let Z_q be the subalgebra of $\tilde{\mathcal{B}}_q$ generated by $x_\beta^{N_\beta}, \beta \in \mathfrak{D}_q$. Then

- The inclusion $\iota : Z_q \rightarrow \tilde{\mathcal{B}}_q$ is injective and the projection $\pi : \tilde{\mathcal{B}}_q \rightarrow \mathcal{B}_q$ is surjective.
- [A5, Theorem 4.10] Z_q is a *normal* Hopf subalgebra of $\tilde{\mathcal{B}}_q$; since $\ker \pi$ is the two-sided ideal generated by $\iota(Z_q^+)$, $\ker \pi = \tilde{\mathcal{B}}_q \iota(Z_q^+)$.
- [A5, Theorem 4.13] $Z_q = {}^{\text{co}\pi}\tilde{\mathcal{B}}_q$.

Hence we have an extension of braided Hopf algebras

$$Z_q \xrightarrow{\iota} \tilde{\mathcal{B}}_q \xrightarrow{\pi} \mathcal{B}_q. \quad (11)$$

The morphisms ι and π are graded. Thus, taking graded duals, we obtain a new sequence of morphisms of braided Hopf algebras

$$\mathcal{B}_q \xrightarrow{\pi^*} \mathcal{L}_q \xrightarrow{\iota^*} \mathfrak{Z}_q. \quad (2)$$

Proposition 3.2. *The sequence (2) is an extension of braided Hopf algebras.*

Proof. The argument of [A, 3.3.1] can be adapted to the present situation, or more generally to extensions of braided Hopf algebras that are graded with finite-dimensional homogeneous components. The map $\pi^* : \mathcal{B}_q \rightarrow \mathcal{L}_q$ is injective because $\mathcal{B}_q \simeq \mathcal{B}_q^*$; $\iota^* : \mathcal{L}_q \xrightarrow{\iota^*} \mathfrak{Z}_q$ is surjective being the transpose of a graded monomorphism between two locally finite graded vector spaces. Now, since $Z_q = {}^{\text{co}}\pi \tilde{\mathcal{B}}_q = \tilde{\mathcal{B}}_q^{\text{co}} \pi$, we have

$$\ker \iota^* = \mathcal{L}_q \mathcal{B}_q^+ = \mathcal{B}_q^+ \mathcal{L}_q. \quad (12)$$

Similarly $\mathcal{L}_q^{\text{co} \iota^*} = \mathcal{B}_q^*$ because $\ker \pi^\perp = \mathcal{B}_q$. \blacksquare

From now on, we assume the condition (1) on the matrix q mentioned in the Introduction, that is

$$q_{\alpha\beta}^{N_\beta} = 1, \quad \forall \alpha, \beta \in \mathfrak{D}_q.$$

The following result is our basic tool to compute the Lie algebra \mathfrak{n}_q .

Theorem 3.3. *The braided Hopf algebra \mathfrak{Z}_q is an usual Hopf algebra, isomorphic to the universal enveloping algebra of the Lie algebra $\mathfrak{n}_q = \mathcal{P}(\mathfrak{Z}_q)$. The elements $\xi_\beta := \iota^*(y_\beta^{(N_\beta)})$, $\beta \in \mathfrak{D}_q$, form a basis of \mathfrak{n}_q .*

Proof. Let A_q be the subspace of \mathcal{L}_q generated by the ordered monomials $y_{\beta_{i_1}}^{(r_1 N_{\beta_{i_1}})} \cdots y_{\beta_{i_k}}^{(r_k N_{\beta_{i_k}})}$ where $\beta_{i_1} < \cdots < \beta_{i_k}$ are all the Cartan roots of \mathcal{B}_q and $r_1, \dots, r_k \in \mathbb{N}_0$. We claim that the restriction of the multiplication $\mu : \mathcal{B}_q \otimes A_q \rightarrow \mathcal{L}_q$ is an isomorphism of vector spaces. Indeed, μ is surjective by the commuting relations in \mathcal{L}_q . Also, the Hilbert series of \mathcal{L}_q , \mathcal{B}_q and A_q are respectively:

$$\begin{aligned} \mathcal{H}_{\mathcal{L}_q} &= \prod_{\beta_k \in \mathfrak{D}_q} \frac{1}{1 - T^{\deg \beta}} \cdot \prod_{\beta_k \notin \mathfrak{D}_q} \frac{1 - T^{N_\beta \deg \beta}}{1 - T^{\deg \beta}}; \\ \mathcal{H}_{\mathcal{B}_q} &= \prod_{\beta_k \in \Delta_q^+} \frac{1 - T^{N_\beta \deg \beta}}{1 - T^{\deg \beta}}; \\ \mathcal{H}_{A_q} &= \prod_{\beta_k \in \mathfrak{D}_q} \frac{1}{1 - T^{N_\beta \deg \beta}}. \end{aligned}$$

Since the multiplication is graded and $\mathcal{H}_{\mathcal{L}_q} = \mathcal{H}_{\mathcal{B}_q} \mathcal{H}_{A_q}$, μ is injective. The claim follows and we have

$$\mathcal{L}_q = A_q \oplus \mathcal{B}_q^+ A_q. \quad (13)$$

We next claim that $\iota^* : A_q \rightarrow \mathfrak{Z}_q$ is an isomorphism of vector spaces. Indeed, by (12), $\ker \iota^* = \mathcal{B}_q^+ \mathcal{L}_q = \mathcal{B}_q^+ (\mathcal{B}_q A_q) = \mathcal{B}_q^+ A_q$. By (13), the claim follows.

By (1), Z_q is a commutative Hopf algebra, see [A5]; hence \mathfrak{Z}_q is a cocommutative Hopf algebra. Now the elements $\xi_\beta := \iota^*(y_\beta^{(N_\beta)})$, $\beta \in \mathfrak{D}_q$, are primitive,

i.e. belong to $\mathfrak{n}_q = \mathcal{P}(\mathfrak{Z}_q)$. The monomials $\zeta_{\beta_{i_1}}^{r_1} \cdots \zeta_{\beta_{i_k}}^{r_k}$, $\beta_{i_1} < \cdots < \beta_{i_k} \in \mathfrak{D}_q$, $r_1, \dots, r_k \in \mathbb{N}_0$ form a basis of \mathfrak{Z}_q , hence

$$\mathfrak{Z}_q = \mathbf{k}\langle \zeta_\beta : \beta \in \mathfrak{D}_q \rangle \subseteq \mathcal{U}(\mathfrak{n}_q) \subseteq \mathfrak{Z}_q.$$

We conclude that $(\zeta_\beta)_{\beta \in \mathfrak{D}_q}$ is a basis of \mathfrak{n}_q and that $\mathfrak{Z}_q = \mathcal{U}(\mathfrak{n}_q)$. \blacksquare

4 Proof of Theorem 1.1

In this section we consider all indecomposable matrices q of rank 2 whose associated Nichols algebra \mathcal{B}_q is finite-dimensional; these are classified in [H2] and we recall their diagrams in Table 1. For each q we obtain an isomorphism between \mathfrak{Z}_q and $\mathcal{U}(\mathfrak{g}^+)$, the universal enveloping algebra of the positive part of \mathfrak{g} . Here \mathfrak{g} is the semisimple Lie algebra of the last column of Table 1, with Cartan matrix $A = (a_{ij})_{1 \leq i, j \leq 2}$. By simplicity we denote \mathfrak{g} by its type, e.g. $\mathfrak{g} = A_2$.

We recall that we assume (1) and that $\zeta_\beta = \iota^*(y_\beta^{(N_\beta)}) \in \mathfrak{Z}_q$. Thus,

$$[\zeta_\alpha, \zeta_\beta]_c = \zeta_\alpha \zeta_\beta - \zeta_\beta \zeta_\alpha = [\zeta_\alpha, \zeta_\beta], \quad \text{for all } \alpha, \beta \in \mathfrak{D}_q.$$

The strategy to prove the isomorphism $\mathfrak{F} : \mathcal{U}(\mathfrak{g}^+) \rightarrow \mathfrak{Z}_q$ is the following:

1. If $\mathfrak{D}_q = \emptyset$, then $\mathfrak{g}^+ = 0$. If $|\mathfrak{D}_q| = 1$, then $\mathfrak{g} = \mathfrak{sl}_2$, i.e. of type A_1 .
2. If $|\mathfrak{D}_q| = 2$, then \mathfrak{g} is of type $A_1 \oplus A_1$. Indeed, let $\mathfrak{D}_q = \{\alpha, \beta\}$. As \mathfrak{Z}_q is \mathbb{N}_0^θ -graded, $[\zeta_\alpha, \zeta_\beta] \in \mathfrak{n}_q$ has degree $N_\alpha \alpha + N_\beta \beta$. Thus $[\zeta_\alpha, \zeta_\beta] = 0$.
3. Now assume that $|\mathfrak{D}_q| > 2$. We recall that \mathfrak{Z}_q is generated by

$$\{\zeta_\beta | x_\beta^{N_\beta} \text{ is a primitive element of } \tilde{\mathcal{B}}_q\}.$$

We compute the coproduct of all $x_\beta^{N_\beta}$ in $\tilde{\mathcal{B}}_q$, $\beta \in \mathfrak{D}_q$, using that $\underline{\Delta}$ is a graded map and Z_q is a Hopf subalgebra of $\tilde{\mathcal{B}}_q$. In all cases we get two primitive elements $x_{\beta_1}^{N_{\beta_1}}$ and $x_{\beta_2}^{N_{\beta_2}}$, thus \mathfrak{Z}_q is generated by ζ_{β_1} and ζ_{β_2} .

4. Using the coproduct again, we check that

$$(\text{ad } \zeta_{\beta_i})^{1-a_{ij}} \zeta_{\beta_j} = 0, \quad 1 \leq i \neq j \leq 2. \quad (14)$$

To prove (14), it is enough to observe that \mathfrak{n}_q has a trivial component of degree $N_{\beta_i}(1-a_{ij})\beta_i + N_{\beta_j}\beta_j$. Now (14) implies that there exists a surjective map of Hopf algebras $\mathfrak{F} : \mathcal{U}(\mathfrak{g}^+) \twoheadrightarrow \mathfrak{Z}_q$ such that $e_i \mapsto \zeta_{\beta_i}$.

5. To prove that \mathfrak{F} is an isomorphism, it suffices to see that the restriction $\mathfrak{g}^+ \xrightarrow{*} \mathfrak{n}_q$ is an isomorphism; but in each case we see that $*$ is surjective, and $\dim \mathfrak{g}^+ = \dim \mathfrak{n}_q = |\mathfrak{D}_q|$.

We refer to [A1, AAY, A4] for the presentation, root system and Cartan roots of braidings of standard, super and unidentified type respectively.

Row 1. Let $q \in \mathbb{G}'_N$, $N \geq 2$. The diagram $\begin{array}{c} q \\ \circ \text{---} q^{-1} \text{---} q \\ \circ \end{array}$ corresponds to a braiding of Cartan type A_2 whose set of positive roots is $\Delta_q^+ = \{\alpha_1, \alpha_1 + \alpha_2, \alpha_2\}$. In this case $\mathfrak{D}_q = \Delta_q^+$ and $N_\beta = N$ for all $\beta \in \mathfrak{D}_q$. By hypothesis, $q_{12}^N = q_{21}^N = 1$. The elements $x_1, x_2 \in \widetilde{\mathcal{B}}_q$ are primitive and

$$\underline{\Delta}(x_{12}) = x_{12} \otimes 1 + 1 \otimes x_{12} + (1 - q^{-1})x_1 \otimes x_2.$$

Then the coproducts of the elements $x_1^N, x_{12}^N, x_2^N \in \widetilde{\mathcal{B}}_q$ are:

$$\begin{aligned} \underline{\Delta}(x_1^N) &= x_1^N \otimes 1 + 1 \otimes x_1^N; & \underline{\Delta}(x_2^N) &= x_2^N \otimes 1 + 1 \otimes x_2^N; \\ \underline{\Delta}(x_{12}^N) &= x_{12}^N \otimes 1 + 1 \otimes x_{12}^N + (1 - q^{-1})^N q_{21}^{\frac{N(N-1)}{2}} x_1^N \otimes x_2^N. \end{aligned}$$

As $[\zeta_2, \zeta_{12}], [\zeta_1, \zeta_{12}] \in \mathfrak{n}_q$ have degree $N\alpha_1 + 2N\alpha_2$, respectively $2N\alpha_1 + N\alpha_2$, and the components of these degrees of \mathfrak{n}_q are trivial, we have

$$[\zeta_2, \zeta_{12}] = [\zeta_1, \zeta_{12}] = 0.$$

Again by degree considerations, there exists $c \in \mathbf{k}$ such that $[\zeta_2, \zeta_1] = c\zeta_{12}$. By the duality between \mathfrak{Z}_q and Z_q we have that

$$[\zeta_2, \zeta_1] = (1 - q^{-1})^N q_{21}^{\frac{N(N-1)}{2}} \zeta_{12}.$$

Then there exists a morphism of algebras $\mathfrak{F} : \mathcal{U}(A_2^+) \rightarrow \mathfrak{Z}_q$ given by

$$e_1 \mapsto \zeta_1, \quad e_2 \mapsto \zeta_2.$$

This morphism takes a basis of A_2^+ to a basis of \mathfrak{n}_q , so $\mathfrak{Z}_q \simeq \mathcal{U}(A_2^+)$.

Row 2. Let $q \in \mathbb{G}'_N$, $N \geq 3$. These diagrams correspond to braidings of super type A with positive roots $\Delta_q^+ = \{\alpha_1, \alpha_1 + \alpha_2, \alpha_2\}$.

The first diagram is $\begin{array}{c} q \\ \circ \text{---} q^{-1} \text{---} -1 \\ \circ \end{array}$. In this case the unique Cartan root is α_1 with $N_{\alpha_1} = N$. The element $x_1^N \in \widetilde{\mathcal{B}}_q$ is primitive and \mathfrak{Z}_q is generated by ζ_1 . Hence $\mathfrak{Z}_q \simeq \mathcal{U}(A_1^+)$.

The second diagram gives a similar situation, since $\mathfrak{D}_q = \{\alpha_1 + \alpha_2\}$.

Row 3. Let $q \in \mathbb{G}'_N$, $N \geq 3$. The diagram $\begin{array}{c} q \\ \circ \text{---} q^{-2} \text{---} q^2 \\ \circ \end{array}$ corresponds to a braiding of Cartan type B_2 with $\Delta_q^+ = \{\alpha_1, 2\alpha_1 + \alpha_2, \alpha_1 + \alpha_2, \alpha_2\}$. In this case $\mathfrak{D}_q = \Delta_q^+$. The coproducts of the generators of $\widetilde{\mathcal{B}}_q$ are:

$$\begin{aligned} \underline{\Delta}(x_1) &= x_1 \otimes 1 + 1 \otimes x_1; & \underline{\Delta}(x_2) &= x_2 \otimes 1 + 1 \otimes x_2; \\ \underline{\Delta}(x_{12}) &= x_{12} \otimes 1 + 1 \otimes x_{12} + (1 - q^{-2})x_1 \otimes x_2; \\ \underline{\Delta}(x_{112}) &= x_{112} \otimes 1 + 1 \otimes x_{112} + (1 - q^{-1})(1 - q^{-2})x_1^2 \otimes x_2 \\ &\quad + q(1 - q^{-2})x_1 \otimes x_{12}. \end{aligned}$$

We have two different cases depending on the parity of N .

1. If N is odd, then $N_\beta = N$ for all $\beta \in \Delta_q^+$. In this case,

$$\begin{aligned}\underline{\Delta}(x_1^N) &= x_1^N \otimes 1 + 1 \otimes x_1^N; & \underline{\Delta}(x_2^N) &= x_2^N \otimes 1 + 1 \otimes x_2^N; \\ \underline{\Delta}(x_{12}^N) &= x_{12}^N \otimes 1 + 1 \otimes x_{12}^N + (1 - q^{-2})^N x_1^N \otimes x_2^N; \\ \underline{\Delta}(x_{112}^N) &= x_{112}^N \otimes 1 + 1 \otimes x_{112}^N + (1 - q^{-1})^N (1 - q^{-2})^N x_1^{2N} \otimes x_2^N \\ &\quad + C x_1^N \otimes x_{12}^N,\end{aligned}$$

for some $C \in \mathbf{k}$. Hence, in \mathfrak{Z}_q we have the relations

$$\begin{aligned}[\tilde{\xi}_1, \tilde{\xi}_2] &= (1 - q^{-2})^N \tilde{\xi}_{12}; \\ [\tilde{\xi}_{12}, \tilde{\xi}_1] &= C \tilde{\xi}_{112}; \\ [\tilde{\xi}_1, \tilde{\xi}_2]_c &= (1 - q^{-1})^N (1 - q^{-2})^N \tilde{\xi}_{112} + (1 - q^{-2})^N \tilde{\xi}_1 \tilde{\xi}_{12}; \\ [\tilde{\xi}_1, \tilde{\xi}_{112}] &= [\tilde{\xi}_2, \tilde{\xi}_{12}] = 0.\end{aligned}$$

Thus there exists an algebra map $\mathfrak{F} : \mathcal{U}(B_2^+) \rightarrow \mathfrak{Z}_q$ given by $e_1 \mapsto \tilde{\xi}_1$, $e_2 \mapsto \tilde{\xi}_2$. Moreover, \mathfrak{F} is an isomorphism, and so $\mathfrak{Z}_q \simeq \mathcal{U}(B_2^+)$. Using the relations of $\mathcal{U}(B_2^+)$ we check that $C = 2(1 - q^{-1})^N (1 - q^{-2})^N$.

(2) If $N = 2M > 2$, then $N_{\alpha_1} = N_{\alpha_1 + \alpha_2} = N$ and $N_{2\alpha_1 + \alpha_2} = N_{\alpha_2} = M$. In this case we have

$$\begin{aligned}\underline{\Delta}(x_1^N) &= x_1^N \otimes 1 + 1 \otimes x_1^N; & \underline{\Delta}(x_2^M) &= x_2^M \otimes 1 + 1 \otimes x_2^M; \\ \underline{\Delta}(x_{12}^N) &= x_{12}^N \otimes 1 + 1 \otimes x_{12}^N + (1 - q^{-2})^N q_{21}^{M(N-1)} x_1^N \otimes x_2^{2M} \\ &\quad + (1 - q^{-2})^M q_{21}^{M^2} x_{112}^M \otimes x_2^M; \\ \underline{\Delta}(x_{112}^M) &= x_{112}^M \otimes 1 + 1 \otimes x_{112}^M + (1 - q^{-1})^M (1 - q^{-2})^M q_{21}^{M(M-1)} x_1^N \otimes x_2^M.\end{aligned}$$

Hence, the following relations hold in \mathfrak{Z}_q :

$$\begin{aligned}[\tilde{\xi}_2, \tilde{\xi}_1] &= (1 - q^{-1})^M (1 - q^{-2})^M q_{21}^{M(M-1)} \tilde{\xi}_{112}; \\ [\tilde{\xi}_{112}, \tilde{\xi}_2] &= (1 - q^{-2})^M q_{21}^{M^2} \tilde{\xi}_{12}; \\ [\tilde{\xi}_1, \tilde{\xi}_{112}] &= [\tilde{\xi}_2, \tilde{\xi}_{12}] = 0.\end{aligned}$$

Thus $\mathfrak{F} : \mathcal{U}(C_2^+) \rightarrow \mathfrak{Z}_q$, $e_1 \mapsto \tilde{\xi}_1$, $e_2 \mapsto \tilde{\xi}_2$, is an isomorphism of algebras. (Of course $C_2 \simeq B_2$ but in higher rank we will get different root systems depending on the parity of N).

Row 4. Let $q \in \mathbf{G}'_N$, $N \neq 2, 4$. These diagrams correspond to braidings of super type B with $\Delta_q^+ = \{\alpha_1, 2\alpha_1 + \alpha_2, \alpha_1 + \alpha_2, \alpha_2\}$.

If the diagram is $\begin{array}{c} q & q^{-2} & -1 \\ \circ & \text{---} & \circ \end{array}$ then the Cartan roots are α_1 and $\alpha_1 + \alpha_2$, with $N_{\alpha_1} = N$, $N_{\alpha_1 + \alpha_2} = M$; here, $M = N$ if N is odd and $M = \frac{N}{2}$ if N is even. The elements $x_1^N, x_{12}^M \in \tilde{\mathcal{B}}_q$ are primitive in $\tilde{\mathcal{B}}_q$. Thus, in \mathfrak{Z}_q , $[\tilde{\xi}_{12}, \tilde{\xi}_1] = 0$ and $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$.

If we consider the diagram $\begin{array}{c} -q^{-1} & q^2 & -1 \\ \circ & \text{---} & \circ \end{array}$ then $\mathfrak{D}_q = \{\alpha_1, \alpha_1 + \alpha_2\}$, $N_{\alpha_1} = M$ and $N_{\alpha_1 + \alpha_2} = N$. The elements $x_1^M, x_{12}^N \in \tilde{\mathcal{B}}_q$ are primitive, so $[\tilde{\xi}_{12}, \tilde{\xi}_1] = 0$ and $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$.

Row 5. Let $q \in \mathbb{G}'_N$, $N \neq 3$, $\zeta \in \mathbb{G}'_3$. The diagram $\begin{array}{c} \zeta \\ \circ \xrightarrow{q^{-1}} \circ \\ q \end{array}$ corresponds to a braiding of standard type B_2 , so $\Delta_q^+ = \{\alpha_1, 2\alpha_1 + \alpha_2, \alpha_1 + \alpha_2, \alpha_2\}$. The other diagram $\begin{array}{c} \zeta \\ \circ \xrightarrow{q\zeta^{-1}} \circ \\ \zeta q^{-1} \end{array}$ is obtained by changing the parameter $q \leftrightarrow \zeta q^{-1}$.

The Cartan roots are $2\alpha_1 + \alpha_2$ and α_2 , with $N_{2\alpha_1 + \alpha_2} = M := \text{ord}(\zeta q^{-1})$ and $N_{\alpha_2} = N$. The elements $x_{112}^M, x_2^N \in \tilde{\mathcal{B}}_q$ are primitive. Thus, in \mathfrak{Z}_q , we have $[\xi_{112}, \xi_2] = 0$. Hence, $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$.

Row 6. Let $\zeta \in \mathbb{G}'_3$. The diagrams $\begin{array}{c} \zeta \\ \circ \xrightarrow{-\zeta} \circ \\ -1 \end{array}$ and $\begin{array}{c} \zeta^{-1} \\ \circ \xrightarrow{-\zeta^{-1}} \circ \\ -1 \end{array}$ correspond to braidings of standard type B , thus $\Delta_q^+ = \{\alpha_1, 2\alpha_1 + \alpha_2, \alpha_1 + \alpha_2, \alpha_2\}$. In both cases \mathfrak{D}_q is empty so the corresponding Lie algebras are trivial.

Row 7. Let $\zeta \in \mathbb{G}'_{12}$. The diagrams of this row correspond to braidings of type $\text{uf}\mathfrak{o}(7)$. In all cases $\mathfrak{D}_q = \emptyset$ and the associated Lie algebras are trivial.

Row 8. Let $\zeta \in \mathbb{G}'_{12}$. The diagrams of this row correspond to braidings of type $\text{uf}\mathfrak{o}(8)$. For $\begin{array}{c} -\zeta^2 \\ \circ \xrightarrow{\zeta} \circ \\ -\zeta^2 \end{array}$, $\Delta_q^+ = \{\alpha_1, 2\alpha_1 + \alpha_2, \alpha_1 + \alpha_2, \alpha_1 + 2\alpha_2, \alpha_2\}$. In this case $\mathfrak{D}_q = \{\alpha_1 + \alpha_2\}$, $N_{\alpha_1 + \alpha_2} = 12$. Hence $\mathfrak{Z}_q \simeq \mathcal{U}(A_1^+)$. The same result holds for the other braidings in this row.

Row 9. Let $\zeta \in \mathbb{G}'_9$. The diagrams of this row correspond to braidings of type $\text{btj}(2; 3)$. If q has diagram $\begin{array}{c} -\zeta \\ \circ \xrightarrow{\zeta^7} \circ \\ \zeta^3 \end{array}$, then

$$\Delta_q^+ = \{\alpha_1, 2\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, \alpha_1 + \alpha_2, \alpha_1 + 2\alpha_2, \alpha_2\}.$$

In this case $\mathfrak{D}_q = \{\alpha_1, \alpha_1 + \alpha_2\}$ and $N_{\alpha_1} = N_{\alpha_1 + \alpha_2} = 18$. Thus $[\xi_{12}, \xi_1] = 0$, so $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$.

If q has diagram $\begin{array}{c} \zeta^3 \\ \circ \xrightarrow{\zeta^8} \circ \\ -1 \end{array}$, $\begin{array}{c} -\zeta^2 \\ \circ \xrightarrow{\zeta} \circ \\ -1 \end{array}$ the set of positive roots are, respectively,

$$\begin{aligned} & \{\alpha_1, 2\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, 4\alpha_1 + 3\alpha_2, \alpha_1 + \alpha_2, \alpha_2\}, \\ & \{\alpha_1, 4\alpha_1 + \alpha_2, 3\alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2, \alpha_1 + \alpha_2, \alpha_2\}; \end{aligned}$$

the Cartan roots are, respectively, $\alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2$ and $\alpha_1, 2\alpha_1 + \alpha_2$. Hence, in both cases, $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$.

Row 10. Let $q \in \mathbb{G}'_N$, $N \geq 4$. The diagram $\begin{array}{c} q \\ \circ \xrightarrow{q^{-3}} \circ \\ q^3 \end{array}$ corresponds to a braiding of Cartan type G_2 , so $\mathfrak{D}_q = \Delta_q^+ = \{\alpha_1, \alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2, 3\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, \alpha_2\}$. The coproducts of the PBW-generators are:

$$\begin{aligned} \underline{\Delta}(x_1) &= x_1 \otimes 1 + 1 \otimes x_1; & \underline{\Delta}(x_2) &= x_2 \otimes 1 + 1 \otimes x_2; \\ \underline{\Delta}(x_{12}) &= x_{12} \otimes 1 + 1 \otimes x_{12} + (1 - q^{-3}) x_1 \otimes x_2; \\ \underline{\Delta}(x_{112}) &= x_{112} \otimes 1 + 1 \otimes x_{112} + (1 + q)(1 - q^{-2}) x_1 \otimes x_{12} \\ & \quad + (1 - q^{-2})(1 - q^{-3}) x_1^2 \otimes x_2; \\ \underline{\Delta}(x_{1112}) &= x_{1112} \otimes 1 + 1 \otimes x_{1112} + q^2(1 - q^{-3}) x_1 \otimes x_{112} \end{aligned}$$

$$\begin{aligned}
& + (q^2 - 1)(1 - q^{-3})x_1^2 \otimes x_{12} + (1 - q^{-3})(1 - q^{-2})(1 - q^{-1})x_1^3 \otimes x_2; \\
\Delta([x_{112}, x_{12}]_c) & = [x_{112}, x_{12}]_c \otimes 1 + 1 \otimes [x_{112}, x_{12}]_c + (q - q^{-1})x_{112} \otimes x_{12} \\
& + (1 - q^{-3})(1 + q)(1 - q^{-1} + q)x_{112}x_1 \otimes x_2 \\
& - qq_{21}(1 - q^{-3})(1 + q - q^2)x_{1112} \otimes x_2 + q^2q_{21}(1 - q^{-3})x_1 \otimes [x_{112}, x_2]_c \\
& + (1 - q^{-3})^2(q^2 - 1)x_1^2 \otimes x_2x_{12} \\
& + q_{21}(1 - q^{-3})^2(1 - q^{-2})(1 - q^{-1})x_1^3 \otimes x_2^2.
\end{aligned}$$

We have two cases.

1. If 3 does not divide N , then $N_\beta = N$ for all $\beta \in \Delta_q^+$. Thus, in $\tilde{\mathcal{B}}_q$,

$$\begin{aligned}
\Delta(x_1^N) & = x_1^N \otimes 1 + 1 \otimes x_1^N; & \Delta(x_2^N) & = x_2^N \otimes 1 + 1 \otimes x_2^N; \\
\Delta(x_{12}^N) & = x_{12}^N \otimes 1 + 1 \otimes x_{12}^N + a_1 x_1^N \otimes x_2^N; \\
\Delta(x_{112}^N) & = x_{112}^N \otimes 1 + 1 \otimes x_{112}^N + a_2 x_1^N \otimes x_{12}^N + a_3 x_1^{2N} \otimes x_2^N; \\
\Delta(x_{1112}^N) & = x_{1112}^N \otimes 1 + 1 \otimes x_{1112}^N + a_4 x_1^N \otimes x_{112}^N + a_5 x_1^{2N} \otimes x_{12}^N \\
& + a_6 x_1^{3N} \otimes x_2^N; \\
\Delta([x_{112}, x_{12}]_c^N) & = [x_{112}, x_{12}]_c^N \otimes 1 + 1 \otimes [x_{112}, x_{12}]_c^N + a_7 x_{112}^N \otimes x_{12}^N \\
& + a_8 x_{1112}^N \otimes x_2^N + a_9 x_1^N \otimes x_{12}^{2N} + a_{10} x_1^{2N} \otimes x_2^N x_{12}^N \\
& + a_{11} x_{112}^N x_1^N \otimes x_2^N + a_{12} x_1^{3N} \otimes x_2^{2N};
\end{aligned}$$

for some $a_i \in \mathbf{k}$. Since

$$\begin{aligned}
a_1 & = (1 - q^{-3})^N q_{21}^{\frac{N(N-1)}{2}} \neq 0, \\
a_3 & = (1 - q^{-2})^N (1 - q^{-3})^N \neq 0, \\
a_6 & = (1 - q^{-1})^N (1 - q^{-2})^N (1 - q^{-3})^N q_{21}^{\frac{3N(N-1)}{2}} \neq 0, \\
a_{12} & = (1 - q^{-1})^N (1 - q^{-2})^N (1 - q^{-3})^{2N} \neq 0,
\end{aligned}$$

the elements $x_{12}^N, x_{112}^N, x_{1112}^N$ and $[x_{112}, x_{12}]_c^N$ are not primitive. Hence \mathfrak{Z}_q is generated by $\tilde{\zeta}_1$ and $\tilde{\zeta}_2$; also

$$\begin{aligned}
[\tilde{\zeta}_2, \tilde{\zeta}_1] & = a_1 \tilde{\zeta}_{12}; & [\tilde{\zeta}_{12}, \tilde{\zeta}_1] & = a_2 \tilde{\zeta}_{112}; \\
[\tilde{\zeta}_{112}, \tilde{\zeta}_1] & = a_4 \tilde{\zeta}_{1112}; & [\tilde{\zeta}_1, \tilde{\zeta}_{1112}] & = [\tilde{\zeta}_2, \tilde{\zeta}_{12}] = 0.
\end{aligned}$$

Thus, we have $\mathfrak{Z}_q \simeq \mathcal{U}(G_2^+)$.

(2) If $N = 3M$, then $N_{\alpha_1} = N_{\alpha_1 + \alpha_2} = N_{2\alpha_1 + \alpha_2} = N$ and $N_{3\alpha_1 + \alpha_2} = N_{3\alpha_1 + 2\alpha_2} = N_{\alpha_2} = M$. In this case we have

$$\begin{aligned}
\Delta(x_1^N) & = x_1^N \otimes 1 + 1 \otimes x_1^N; & \Delta(x_2^M) & = x_2^M \otimes 1 + 1 \otimes x_2^M; \\
\Delta(x_{12}^N) & = x_{12}^N \otimes 1 + 1 \otimes x_{12}^N + b_1 [x_{112}, x_{12}]_c^M \otimes x_2^M
\end{aligned}$$

$$\begin{aligned}
& + b_2 x_{1112}^M \otimes x_2^{2M} + (1 - q^{-3})^N q_{21}^{\frac{N(N-1)}{2}} x_1^N \otimes x_2^{3M}; \\
\Delta(x_{112}^N) & = x_{112}^N \otimes 1 + 1 \otimes x_{112}^N + b_3 x_1^N \otimes x_{12}^N + b_4 x_{1112}^M \otimes [x_{112}, x_{12}]_c^M \\
& + (1 - q^{-2})^N (1 - q^{-3})^N x_1^{2N} \otimes x_2^{3M} + b_5 x_{1112}^{2M} \otimes x_2^M \\
& + b_6 x_{1112}^M x_1^N \otimes x_2^{2M} + b_7 x_1^N \otimes x_2^M [x_{112}, x_{12}]_c^M; \\
\Delta(x_{1112}^M) & = x_{1112}^M \otimes 1 + 1 \otimes x_{1112}^M + b_8 x_1^N \otimes x_2^M; \\
\Delta([x_{112}, x_{12}]_c^M) & = [x_{112}, x_{12}]_c^M \otimes 1 + 1 \otimes [x_{112}, x_{12}]_c^M \\
& + b_9 x_1^N \otimes x_2^{2M} + b_{10} x_{1112}^M \otimes x_2^M;
\end{aligned}$$

for some $b_i \in \mathbf{k}$. We compute some of them explicitly:

$$\begin{aligned}
b_8 & = (1 - q^{-3})^M (1 - q^{-2})^M (1 - q^{-1})^M q_{21}^{\frac{N(M-1)}{2}}, \\
b_9 & = (1 - q^{-3})^{2M} (1 - q^{-2})^M (1 - q^{-1})^M q_{21}^M.
\end{aligned}$$

As these scalars are not zero, the elements x_{12}^N , x_{112}^N , x_{1112}^M and $[x_{112}, x_{12}]_c^M$ are not primitive. Thus $\mathfrak{Z}_q \simeq \mathcal{U}(G_2^+)$.

Row 11. Let $\zeta \in \mathbf{G}'_8$. The diagrams of this row correspond to braidings of standard type G_2 , so $\Delta_q^+ = \{\alpha_1, 3\alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, \alpha_1 + \alpha_2, \alpha_2\}$.

If q has diagram $\begin{array}{c} \zeta^2 \quad \zeta \quad \zeta^{-1} \\ \circ \text{---} \circ \end{array}$, then the Cartan roots are $2\alpha_1 + \alpha_2$ and α_2 with $N_{2\alpha_1 + \alpha_2} = N_{\alpha_2} = 8$. The elements $x_{112}^8, x_2^8 \in \tilde{\mathcal{B}}_q$ are primitive and $[\zeta_2, \zeta_{112}] = 0$ in \mathfrak{Z}_q . Hence $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$. An analogous result holds for the other diagrams of the row.

Row 12. Let $\zeta \in \mathbf{G}'_{24}$. This row corresponds to type $\text{uf}\mathfrak{o}(9)$. If q has diagram

$$\begin{array}{c} \zeta^6 \quad \zeta^{11} \quad \zeta^8 \\ \circ \text{---} \circ \end{array}, \text{ then}$$

$$\Delta_q^+ = \{\alpha_1, 3\alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, 4\alpha_1 + 3\alpha_2, \alpha_1 + \alpha_2, \alpha_1 + 2\alpha_2, \alpha_2\}$$

and $\mathfrak{D}_q = \{\alpha_1 + \alpha_2, 3\alpha_1 + \alpha_2\}$. Here, $N_{\alpha_1 + \alpha_2} = N_{3\alpha_1 + \alpha_2} = 24$, and $x_{12}^{24}, x_{1112}^{24} \in \tilde{\mathcal{B}}_q$ are primitive. In \mathfrak{Z}_q we have the relation $[\zeta_{12}, \zeta_{1112}] = 0$; thus $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$.

For the other diagrams, $\begin{array}{c} \zeta^6 \quad \zeta \quad \zeta^{-1} \\ \circ \text{---} \circ \end{array}$, $\begin{array}{c} \zeta^8 \quad \zeta^5 \quad -1 \\ \circ \text{---} \circ \end{array}$ and $\begin{array}{c} \zeta \quad \zeta^{19} \quad -1 \\ \circ \text{---} \circ \end{array}$, the sets of positive roots are, respectively,

$$\begin{aligned}
& \{\alpha_1, \alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2, 3\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, 5\alpha_1 + 2\alpha_2, 5\alpha_1 + 3\alpha_2, \alpha_2\}, \\
& \{\alpha_1, \alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, 4\alpha_1 + 3\alpha_2, 5\alpha_1 + 3\alpha_2, 5\alpha_1 + 4\alpha_2, \alpha_2\}, \\
& \{\alpha_1, \alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2, 3\alpha_1 + \alpha_2, 4\alpha_1 + \alpha_2, 5\alpha_1 + \alpha_2, 5\alpha_1 + 2\alpha_2, \alpha_2\}.
\end{aligned}$$

The Cartan roots are, respectively, $2\alpha_1 + \alpha_2, \alpha_2$; $\alpha_1 + \alpha_2, 5\alpha_1 + 3\alpha_2$; $\alpha_1, 5\alpha_1 + 2\alpha_2$. Hence, in all cases, $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$.

Row 13. Let $\zeta \in \mathbf{G}'_5$. The braidings in this row are associated to the Lie superalgebra $\text{brj}(2; 5)$ [A5, §5.2]. If q has diagram $\begin{array}{c} \zeta \quad \zeta^2 \quad -1 \\ \circ \text{---} \circ \end{array}$, then $\Delta_q^+ = \{\alpha_1, 3\alpha_1 +$

$\alpha_2, 2\alpha_1 + \alpha_2, 5\alpha_1 + 3\alpha_2, 3\alpha_1 + 2\alpha_2, 4\alpha_1 + 3\alpha_2, \alpha_1 + \alpha_2, \alpha_2\}$. In this case the Cartan roots are $\alpha_1, \alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2$ and $3\alpha_1 + \alpha_2$, with $N_{\alpha_1} = N_{3\alpha_1 + 2\alpha_2} = 5$ and $N_{\alpha_1 + \alpha_2} = N_{2\alpha_1 + \alpha_2} = 10$. In $\tilde{\mathcal{B}}_{\mathfrak{q}}$,

$$\begin{aligned}\underline{\Delta}(x_1) &= x_1 \otimes 1 + 1 \otimes x_1; \\ \underline{\Delta}(x_{12}) &= x_{12} \otimes 1 + 1 \otimes x_{12} + (1 - \zeta^2) x_1 \otimes x_2; \\ \underline{\Delta}(x_{112}) &= x_{112} \otimes 1 + 1 \otimes x_{112} + (1 + \zeta)(1 - \zeta^3) x_1 \otimes x_{12} \\ &\quad + (1 - \zeta^2)(1 - \zeta^3) x_1^2 \otimes x_2; \\ \underline{\Delta}([x_{112}, x_{12}]_c) &= [x_{112}, x_{12}]_c \otimes 1 + 1 \otimes [x_{112}, x_{12}]_c \\ &\quad - \zeta^3(1 - \zeta^3)(1 + \zeta)^2 x_1 \otimes x_{12}^2 - \zeta q_{21} x_1 x_{112} \otimes x_2 \\ &\quad + (1 + q_{21} + \zeta^3 q_{21}) x_{112} x_1 \otimes x_2 + \zeta(1 - \zeta^2) x_1 x_{12} x_1 \otimes x_2 \\ &\quad + (1 - \zeta^2)(1 - \zeta^3)^2 x_1^2 \otimes x_2 x_{12}.\end{aligned}$$

Hence the coproducts of $x_1^5, x_{12}^{10}, x_{112}^{10}, [x_{112}, x_{12}]_c^5 \in \tilde{\mathcal{B}}_{\mathfrak{q}}$ are:

$$\begin{aligned}\underline{\Delta}(x_1^5) &= x_1^5 \otimes 1 + 1 \otimes x_1^5; & \underline{\Delta}(x_{12}^{10}) &= x_{12}^{10} \otimes 1 + 1 \otimes x_{12}^{10}; \\ \underline{\Delta}(x_{112}^{10}) &= x_{112}^{10} \otimes 1 + 1 \otimes x_{112}^{10} + a_1 x_1^{10} \otimes x_{12}^{10} + a_2 x_1^5 \otimes [x_{112}, x_{12}]_c^5; \\ \underline{\Delta}([x_{112}, x_{12}]_c^5) &= [x_{112}, x_{12}]_c^5 \otimes 1 + 1 \otimes [x_{112}, x_{12}]_c^5 + a_3 x_1^5 \otimes x_{12}^{10}.\end{aligned}$$

for some $a_i \in \mathbf{k}$. Thus, the following relations hold in $\mathfrak{Z}_{\mathfrak{q}}$

$$[\zeta_{12}, \zeta_1] = a_3 \zeta_{112,12}; \quad [\zeta_{112,12}, \zeta_1] = a_2 \zeta_{112}; \quad [\zeta_1, \zeta_{112,12}] = [\zeta_{12}, \zeta_{112}] = 0.$$

Since

$$\begin{aligned}a_1 &= -(1 - \zeta^3)^5(1 + \zeta)^5(1 + 62\zeta - 15\zeta^2 - 87\zeta^3 + 70\zeta^4) \neq 0; \\ a_3 &= -(1 - \zeta^3)^5(1 + \zeta)^8(4 - 8\zeta - 19\zeta^2 - 3\zeta^3 - 50\zeta^4) \neq 0,\end{aligned}$$

the elements $x_{112}^{10}, [x_{112}, x_{12}]_c^5$ are not primitive, so ζ_1, ζ_{12} generate $\mathfrak{Z}_{\mathfrak{q}}$. Hence, $\mathfrak{Z}_{\mathfrak{q}} \simeq \mathcal{U}(B_2^+)$.

If \mathfrak{q} has diagram $\begin{array}{c} \xrightarrow{-\zeta^3} \zeta^3 \xrightarrow{-1} \\ \circ \qquad \qquad \qquad \circ \end{array}$, then

$$\begin{aligned}\Delta_{\mathfrak{q}}^+ &= \{\alpha_1, 4\alpha_1 + \alpha_2, 3\alpha_1 + \alpha_2, 5\alpha_1 + 2\alpha_2, 2\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, \alpha_1 + \alpha_2, \alpha_2\}, \\ \mathfrak{D}_{\mathfrak{q}} &= \{\alpha_1, 3\alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2, \alpha_1 + \alpha_2\},\end{aligned}$$

with $N_{\alpha_1} = N_{\alpha_1 + \alpha_2} = 10, N_{3\alpha_1 + \alpha_2} = N_{\alpha_1 + \alpha_2} = 5$. In $\tilde{\mathcal{B}}_{\mathfrak{q}}$

$$\begin{aligned}\underline{\Delta}(x_1) &= x_1 \otimes 1 + 1 \otimes x_1; \\ \underline{\Delta}(x_{12}) &= x_{12} \otimes 1 + 1 \otimes x_{12} + (1 - \zeta^3) x_1 \otimes x_2; \\ \underline{\Delta}(x_{112}) &= x_{112} \otimes 1 + 1 \otimes x_{112} + (1 + \zeta)(1 - \zeta^3) x_1 \otimes x_{12} \\ &\quad + (1 + \zeta^2)(1 - \zeta^3) x_1^2 \otimes x_2; \\ \underline{\Delta}(x_{1112}) &= x_{1112} \otimes 1 + 1 \otimes x_{1112} + (1 + \zeta - \zeta^3)(1 - \zeta^4) x_1 \otimes x_{112} \\ &\quad + (1 + \zeta)(1 + \zeta - \zeta^3)(1 - \zeta^4) x_1^2 \otimes x_{12} + (1 + \zeta)(1 - \zeta^3)(1 - \zeta^4) x_1^3 \otimes x_2.\end{aligned}$$

Hence the coproducts of $x_1^{10}, x_{12}^5, x_{112}^{10}, x_{1112}^5 \in \tilde{\mathcal{B}}_q$ are:

$$\begin{aligned}\underline{\Delta}(x_1^{10}) &= x_1^{10} \otimes 1 + 1 \otimes x_1^{10}; & \underline{\Delta}(x_{12}^5) &= x_{12}^5 \otimes 1 + 1 \otimes x_{12}^5; \\ \underline{\Delta}(x_{112}^{10}) &= x_{112}^{10} \otimes 1 + 1 \otimes x_{112}^{10} - (1 + \zeta)^5 (1 - \zeta^3)^5 x_{1112}^5 \otimes x_{12}^5 \\ &\quad + (1 + \zeta)^{10} (1 - \zeta^3)^{10} x_1^{10} \otimes x_{12}^{10}; \\ \underline{\Delta}(x_{1112}^5) &= x_{1112}^5 \otimes 1 + 1 \otimes x_{1112}^5 + (1 + \zeta)^{10} (1 - \zeta^3)^5 x_1^{10} \otimes x_{12}^5.\end{aligned}$$

Thus, the generators of \mathfrak{Z}_q are ξ_1 and ξ_{12} and they satisfy the following relations

$$\begin{aligned}[\xi_{12}, \xi_1] &= (1 + \zeta)^{10} (1 - \zeta^3)^5 \xi_{1112}, \\ [\xi_{1112}, \xi_{12}] &= -(1 + \zeta)^5 (1 - \zeta^3)^5 \xi_{112}, \\ [\xi_1, \xi_{1112}] &= [\xi_{12}, \xi_{1112}] = 0.\end{aligned}$$

Hence $\mathfrak{Z}_q \simeq \mathcal{U}(C_2^+)$.

Row 14. Let $\zeta \in G'_{20}$. This row corresponds to type $uf\mathfrak{o}(10)$. If q has diagram

$\begin{array}{c} \zeta \quad \zeta^{17} \quad -1 \\ \circ \text{---} \zeta^{17} \text{---} \circ \end{array}$, then $\Delta_q^+ = \{\alpha_1, 3\alpha_1 + \alpha_2, 2\alpha_1 + \alpha_2, 5\alpha_1 + 3\alpha_2, 3\alpha_1 + 2\alpha_2, 4\alpha_1 + 3\alpha_2, \alpha_1 + \alpha_2, \alpha_2\}$. The Cartan roots are α_1 and $3\alpha_1 + 2\alpha_2$ with $N_{\alpha_1} = N_{3\alpha_1 + 2\alpha_2} = 20$. The elements $x_1^{20}, [x_{112}, x_{12}]_c^{20} \in \tilde{\mathcal{B}}_q$ are primitive; thus $[\xi_{12}, \xi_{112,12}] = 0$ in \mathfrak{Z}_q and $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$. The same holds when the diagram of q is another one in this row: $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$.

Row 15. Let $\zeta \in G'_{15}$. This row corresponds to type $uf\mathfrak{o}(11)$. If q has diagram

$\begin{array}{c} -\zeta \quad -\zeta^{12} \quad \zeta^5 \\ \circ \text{---} -\zeta^{12} \text{---} \circ \end{array}$, then $\Delta_q^+ = \{\alpha_1, 3\alpha_1 + \alpha_2, 5\alpha_1 + 2\alpha_2, 2\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, \alpha_1 + \alpha_2, \alpha_1 + 2\alpha_2, \alpha_2\}$. The Cartan roots are α_1 and $3\alpha_1 + 2\alpha_2$ with $N_{\alpha_1} = N_{3\alpha_1 + 2\alpha_2} = 30$. In \mathfrak{Z}_q we have $[\xi_{12}, \xi_{112,12}] = 0$, thus $\mathfrak{Z}_q \simeq \mathcal{U}((A_1 \oplus A_1)^+)$. The same result holds if we consider the other diagrams of this row.

Row 16. Let $\zeta \in G'_{12}$. This row corresponds to type $uf\mathfrak{o}(12)$. If q has diagram

$\begin{array}{c} -\zeta^5 \quad -\zeta^3 \quad -1 \\ \circ \text{---} -\zeta^3 \text{---} \circ \end{array}$, then

$$\begin{aligned}\Delta_q^+ &= \{\alpha_1, 5\alpha_1 + \alpha_2, 4\alpha_1 + \alpha_2, 7\alpha_1 + 2\alpha_2, 3\alpha_1 + \alpha_2, 8\alpha_1 + 3\alpha_2, \\ &\quad 5\alpha_1 + 2\alpha_2, 7\alpha_1 + 3\alpha_2, 2\alpha_1 + \alpha_2, 3\alpha_1 + 2\alpha_2, \alpha_1 + \alpha_2, \alpha_2\}.\end{aligned}$$

Also, $\mathfrak{D}_q = \{\alpha_1, 4\alpha_1 + \alpha_2, 3\alpha_1 + \alpha_2, 5\alpha_1 + 2\alpha_2, 2\alpha_1 + \alpha_2, \alpha_1 + \alpha_2\}$ with $N_\beta = 14$ for all $\beta \in \mathfrak{D}_q$. In $\tilde{\mathcal{B}}_q$ we have

$$\begin{aligned}\underline{\Delta}(x_1) &= x_1 \otimes 1 + 1 \otimes x_1; \\ \underline{\Delta}(x_{12}) &= x_{12} \otimes 1 + 1 \otimes x_{12} + (1 + \zeta^3) x_1 \otimes x_2; \\ \underline{\Delta}(x_{112}) &= x_{112} \otimes 1 + 1 \otimes x_{112} + (1 - \zeta)(1 - \zeta^5) x_1 \otimes x_{12} \\ &\quad + (1 - \zeta)(1 + \zeta^3) x_1^2 \otimes x_2; \\ \underline{\Delta}(x_{1112}) &= x_{1112} \otimes 1 + 1 \otimes x_{1112} + (1 + \zeta^3 - \zeta^5)(1 + \zeta^6) x_1 \otimes x_{112} \\ &\quad + \zeta(\zeta^3 - 1) x_1^2 \otimes x_{12} + \zeta^6(1 - \zeta^2)(1 + \zeta^3) x_1^3 \otimes x_2;\end{aligned}$$

$$\begin{aligned}
\underline{\Delta}(x_{11112}) &= x_{11112} \otimes 1 + 1 \otimes x_{11112} - \zeta(1 - \zeta)(1 - \zeta^2) x_1 \otimes x_{1112} \\
&\quad + (-2 + 2\zeta^2 - \zeta^4 + \zeta^5) x_1^2 \otimes x_{112} - (1 - \zeta)(1 - \zeta^2)^2 x_1^3 \otimes x_{12} \\
&\quad + \zeta^2(1 - \zeta)(1 - \zeta^2) x_1^4 \otimes x_2; \\
\underline{\Delta}([x_{1112}, x_{112}]_c) &= [x_{1112}, x_{112}]_c \otimes 1 + 1 \otimes [x_{1112}, x_{112}]_c \\
&\quad - \frac{(1 - \zeta^5)}{(1 + \zeta)}(1 - \zeta^3 + 2\zeta^4) x_1 \otimes x_{112}^2 \\
&\quad - q_{21}(1 - \zeta)(1 - \zeta^3) x_1^2 \otimes [x_{112}, x_{12}]_c \\
&\quad - (1 - \zeta)^2(4 + 4\zeta + \zeta^2 - 2\zeta^3 - 3\zeta^4) x_1^2 \otimes x_{12}x_{112} \\
&\quad + q_{21}(1 - \zeta^2)^2\zeta^4(1 - 2\zeta - 3\zeta^4 - 2\zeta^5 + \zeta^6) x_1^3 \otimes x_{12}^2 \\
&\quad + (1 - \zeta)^2(1 + \zeta^3)^2(1 + \zeta^6) x_1^3 \otimes x_2x_{112} \\
&\quad - \zeta(1 - \zeta)(1 - \zeta^2) x_{1112} \otimes x_{112} \\
&\quad - q_{21}\zeta^6(1 - \zeta)^2(1 - \zeta^2)(1 + 2\zeta) x_1^4 \otimes x_2x_{12} \\
&\quad + q_{21}^2\zeta^2(1 - \zeta)^2(1 - \zeta^2)(1 + \zeta^3) x_1^5 \otimes x_2^2 \\
&\quad - q_{12}^2(1 + \zeta^3)(1 - \zeta)(1 - \zeta^4 + \zeta^6) x_{11112} \otimes x_2 \\
&\quad + \zeta q_{21}(1 + \zeta^3)(1 - \zeta)(1 - \zeta^2)(1 + \zeta - \zeta^2) x_{11112}x_1 \otimes x_2 \\
&\quad - \zeta(1 - \zeta)^2(1 + \zeta^3)(1 - \zeta - 2\zeta^2 - \zeta^3) x_{1112}x_1^2 \otimes x_2 \\
&\quad + (1 - \zeta)(1 + \zeta^2 + \zeta^3 - \zeta^4 - \zeta^5) x_{1112}x_1 \otimes x_{12} \\
&\quad + \zeta q_{21}(1 - \zeta)^2(2 + \zeta - \zeta^3) x_{11112} \otimes x_{12}.
\end{aligned}$$

Hence

$$\begin{aligned}
\underline{\Delta}(x_1^{14}) &= x_1^{14} \otimes 1 + 1 \otimes x_1^{14}; & \underline{\Delta}(x_{12}^{14}) &= x_{12}^{14} \otimes 1 + 1 \otimes x_{12}^{14}; \\
\underline{\Delta}(x_{112}^{14}) &= x_{112}^{14} \otimes 1 + 1 \otimes x_{112}^{14} + a_1 x_1^{14} \otimes x_{12}^{14}; \\
\underline{\Delta}(x_{1112}^{14}) &= x_{1112}^{14} \otimes 1 + 1 \otimes x_{1112}^{14} + a_2 x_1^{14} \otimes x_{112}^{14} + a_3 x_1^{28} \otimes x_{12}^{14}; \\
\underline{\Delta}(x_{11112}^{14}) &= x_{11112}^{14} \otimes 1 + 1 \otimes x_{11112}^{14} + a_4 x_1^{14} \otimes x_{1112}^{14} \\
&\quad + a_5 x_1^{28} \otimes x_{112}^{14} + a_6 x_1^{42} \otimes x_{12}^{14}; \\
\underline{\Delta}([x_{1112}, x_{112}]_c^{14}) &= [x_{1112}, x_{112}]_c^{14} \otimes 1 + 1 \otimes [x_{1112}, x_{112}]_c^{14} + a_7 x_{1112}^{14} \otimes x_{12}^{14} \\
&\quad + a_8 x_{11112}^{14} \otimes x_{12}^{14} + a_9 x_1^{42} \otimes x_{12}^{28} + a_{10} x_1^{14} \otimes x_{112}^{28} \\
&\quad + a_{11} x_1^{28} \otimes x_{12}^{14}x_{112}^{14} + a_{12} x_{1112}^{14}x_1^{14} \otimes x_{12}^{14};
\end{aligned}$$

with $a_i \in \mathbf{k}$. For instance,

$$a_1 = q_{21}^7(-2352\zeta^5 + 2548\zeta^4 + 2548\zeta^3 - 2352\zeta^2 + 4067) \neq 0,$$

because $\zeta \in \mathbf{G}'_7$. Also,

$$\begin{aligned}
a_3 &= 5860813\zeta^5 + 974589\zeta^4 - 3164658\zeta^3 + 3609109\zeta^2 \\
&\quad + 5243917\zeta - 1667869 \neq 0; \\
a_6 &= q_{21}^7(10074385052942\zeta^5 + 31910289509889\zeta^4 + 12118010152752\zeta^3 \\
&\quad - 909500144560\zeta^2 + 24680570802531\zeta + 26319432020966) \neq 0;
\end{aligned}$$

$$\begin{aligned}
a_9 = & 5736482678185949424\zeta^5 + 10808606486393112796\zeta^4 \\
& + 2814368183725984844\zeta^3 + 1300044629337708464\zeta^2 \\
& + 9968706251262033856\zeta + 7625687982247823061 \neq 0.
\end{aligned}$$

Then x_{112}^{14} , x_{1112}^{14} , x_{11112}^{14} and $[x_{1112}, x_{112}]_c^{14}$ are not primitive elements in $\tilde{\mathcal{B}}_q$. Thus, $\tilde{\zeta}_1$ and $\tilde{\zeta}_{12}$ generates \mathfrak{Z}_q .

Also, in \mathfrak{Z}_q we have

$$\begin{aligned}
[\tilde{\zeta}_{12}, \tilde{\zeta}_1] &= a_1 \tilde{\zeta}_{112}; & [\tilde{\zeta}_1, \tilde{\zeta}_{112}] &= a_2 \tilde{\zeta}_{1112}; \\
[\tilde{\zeta}_1, \tilde{\zeta}_{1112}] &= a_4 \tilde{\zeta}_{11112}; & [\tilde{\zeta}_1, \tilde{\zeta}_{11112}] &= [\tilde{\zeta}_{12}, \tilde{\zeta}_{112}] = 0.
\end{aligned}$$

So, $\mathfrak{Z}_q \simeq \mathcal{U}(G_2^+)$.

In the case of the diagram $\begin{array}{c} \overset{-\zeta}{\circ} \text{---} \overset{-\zeta^4}{\circ} \text{---} \overset{-1}{\circ} \\ \circ \end{array}$ \mathfrak{Z}_q is generated by $\tilde{\zeta}_1$, $\tilde{\zeta}_{12}$ and

$$\begin{aligned}
[\tilde{\zeta}_{12}, \tilde{\zeta}_1] &= b_1 \tilde{\zeta}_{112}; & [\tilde{\zeta}_{12}, \tilde{\zeta}_{112}] &= b_2 \tilde{\zeta}_{112,12}; \\
[\tilde{\zeta}_{12}, \tilde{\zeta}_{112,12}] &= b_3 \tilde{\zeta}_{(112,12),12}; & [\tilde{\zeta}_1, \tilde{\zeta}_{112}] &= [\tilde{\zeta}_{12}, \tilde{\zeta}_{(112,12),12}] = 0,
\end{aligned}$$

where $b_1, b_2, b_3 \in \mathbf{k}^\times$. Hence, we also have $\mathfrak{Z}_q \simeq \mathcal{U}(G_2^+)$.

Remark 4.1. The results of this paper are part of the thesis of one of the authors [RB], where missing details of the computations can be found.
