

GROUPS WITH A CYCLIC SYLOW SUBGROUP

WALTER FEIT¹⁾

Dedicated to the memory of TADASI NAKAYAMA

§ 1. Introduction

By focussing attention on indecomposable modular representations J. G. Thompson [11] has recently simplified and generalized some classical results of R. Brauer [1] concerning groups which have a Sylow group of prime order. In this paper this approach will be used to prove some results which generalize theorems of R. Brauer [2] and H. F. Tuan [12].

We will say that a finite group \mathfrak{G} is of *type* $L_2(p)$ if every composition factor is either a p -group or a p' -group or is isomorphic to $PSL_2(p)$. Thus in particular every p -solvable group is of type $L_2(p)$. It is well known that every subgroup of a group of type $L_2(p)$ is again of type $L_2(p)$.

THEOREM 1. *Let \mathfrak{G} be a finite group with a cyclic S_p -subgroup \mathfrak{P} for some prime p . Assume that \mathfrak{G} is not of type $L_2(p)$. Suppose that \mathfrak{G} has a faithful indecomposable representation \mathfrak{Q} of degree $d \leq p$ in a field of characteristic p . Then $p \neq 2$, $|\mathfrak{P}| = p$, $\mathfrak{Q}|_{\mathfrak{P}}$ is indecomposable and $C_{\mathfrak{G}}(\mathfrak{P}) = \mathfrak{P} \times \mathbf{Z}(\mathfrak{G})$. Furthermore $d \geq 2/3(p-1)$ and $d \geq \frac{7}{10}p - \frac{1}{2}$ in case $p \geq 13$.*

It is known [9] that the multiplier of \mathfrak{A}_5 , \mathfrak{A}_6 , \mathfrak{A}_7 , respectively has a non-trivial complex representation of degree 2, 3, 4 respectively. Hence this is the case in any algebraically closed field. The new simple group discovered by Z. Janko [8] has a 7-dimensional representation in the field of 11 elements. Thus for $p \leq 11$ the estimate in Theorem 1 is the best possible (since d is an integer). However it follows easily from the last statement that $d \geq 2/3(p-1)$ is never the best possible estimate for $p \geq 13$. By modifying the argument in section 4 slightly it can be shown that for $p \geq 13$ the estimate can be improved

provided $|\mathbf{N}_{\mathfrak{G}}(\mathfrak{P}) : \mathbf{C}_{\mathfrak{G}}(\mathfrak{P})|$ is sufficiently large. In particular it is easy to show that if $\mathfrak{G} = \mathfrak{G}'$, $|\mathbf{N}_{\mathfrak{G}}(\mathfrak{P}) : \mathbf{C}_{\mathfrak{G}}(\mathfrak{P})| = p - 1$ and $p \geq 13$ then $d \geq \frac{3(p-1)}{4}$. This is in sharp contrast to the case of Janko's group where $p = 11$, $d = 7$ and $|\mathbf{N}_{\mathfrak{G}}(\mathfrak{P}) : \mathbf{C}_{\mathfrak{G}}(\mathfrak{P})| = 10$. It would be of interest to determine the best possible lower bound for d in case $p \geq 13$. Since the Symmetric group on p letters has a faithful representation of degree $p - 2$ in the field of p elements one cannot do better than $p - 3$. However this is probably much too large in general.

Theorem 1 is easily seen to imply some results of Brauer [2] and Tuan [12] concerning groups \mathfrak{G} which have a faithful irreducible complex representations of "small" degree relative to the size of some prime dividing $|\mathfrak{G}|$. As another application of these methods the following can be proved.

THEOREM 2. *Suppose the S_p -subgroup \mathfrak{P} of \mathfrak{G} is not normal in \mathfrak{G} and $\mathbf{Z}(\mathfrak{G}) = \langle 1 \rangle$. Assume that \mathfrak{G} has a complex irreducible representation of degree d with $\frac{p-1}{2} < d < p - 1$. Let $|\mathbf{N}_{\mathfrak{G}}(\mathfrak{P}) : \mathbf{C}_{\mathfrak{G}}(\mathfrak{P})| = e$. Then \mathfrak{G} is simple and $e \equiv \frac{p-1}{e} \equiv 0 \pmod{2}$. Thus in particular $p \equiv 1 \pmod{4}$.*

The only known groups which satisfy the hypotheses of Theorem 2 are $PSL_2(p)$ with $p \equiv 1 \pmod{4}$ and $d - 1 = e = \frac{p-1}{2}$, and $PSL_2(p-1)$ where $p-1 = 2^a$ for some integer $a > 1$ with $e = 2$ and $d = p - 2$.

§ 2. Preliminaries

Let K be a field and \mathfrak{G} a group. If M, N are $K\mathfrak{G}$ -modules then $M + N$ denotes their direct sum and $aM = M + \cdots + M$ a times for any nonnegative integer a . The kernel of M is the kernel of the representation of \mathfrak{G} corresponding to M . If \mathfrak{H} is a subgroup of \mathfrak{G} then $M|_{\mathfrak{H}}$ denotes the restriction of M to \mathfrak{H} and for any $K\mathfrak{H}$ -module L , $L^{\mathfrak{G}}$ is the $K\mathfrak{G}$ -module induced by L . The contragredient module of M is denoted by M^* . The remainder of the notation and terminology is standard.

Basic properties of modules will be used continually. In particular the Mackey decomposition [3, (44.2)] and a fundamental result of D. G. Higman [3, (63.5)] are of importance. Also a theorem of Schanuel will be used [6, (1.6 e)] or [10, p. 270]. The following result is a simple consequence of the Mackey decomposition, the proof of [3, (51.2)] and Fitting's Lemma.

(2.1) *Suppose that K is a field of characteristic p . Let \mathfrak{P} be a p -group and \mathfrak{H}*

a p' -group. A $K(\mathfrak{P} \times \mathfrak{G})$ -module is indecomposable if and only if it is of the form $V \otimes W$ where V is an indecomposable $K\mathfrak{P}$ -module and W is an irreducible $K\mathfrak{G}$ -module.

An exposition of the fundamentals of the theory of blocks can be found in [3, Chapter XII]. The following special cases of some results of R. Brauer [2] will be needed.

Suppose S_p -subgroup \mathfrak{P} of \mathfrak{G} has order p for some prime p . Assume further that $\mathbf{C}_{\mathfrak{G}}(\mathfrak{P}) = \mathfrak{P} \times \mathbf{Z}(\mathfrak{G})$. Let $e = |\mathbf{N}_{\mathfrak{G}}(\mathfrak{P}) : \mathbf{C}_{\mathfrak{G}}(\mathfrak{P})|$.

(2.2) *If ζ is an irreducible complex character of \mathfrak{G} with $1 < \zeta(1) < p - 1$ then $e < p - 1$ and either $\zeta(1) = e$ or $\zeta(1) = p - e$. In the latter case ζ does not contain the principal Brauer character as a modular constituent. Furthermore if B is the p -block of \mathfrak{G} containing ζ then B contains exactly $\frac{p-1}{e}$ irreducible complex character of degree $\zeta(1)$, any two of which are p -conjugate and hence coincide as Brauer characters.*

(2.3) *If $\mathbf{Z}(\mathfrak{G}) = \langle 1 \rangle$ and $e = 2$ then the degree of any irreducible modular representation of \mathfrak{G} is 1, $p - 2$ or at least p .*

The following result of Tuan [12, Theorem C] is also useful.

(2.4) *Any modular irreducible representation of \mathfrak{G} in the principal block can be written in the field of p elements.*

The proofs of (2.2), (2.3) and (2.4) can be simplified considerably using the methods of [11].

§ 3. Local Results

Throughout this section K is a field of characteristic p . $\mathfrak{G}\mathfrak{P}$ is a Frobenius group with Frobenius kernel \mathfrak{P} where $|\mathfrak{P}| = p$ and $\mathfrak{G} \cap \mathfrak{P} = \langle 1 \rangle$. The one dimensional K -representation α of $\mathfrak{G}\mathfrak{P}$ is defined by

$$(3.1) \quad G^{-1}PG = P^{\alpha(G)} \text{ for } P \in \mathfrak{P}, G \in \mathfrak{G}\mathfrak{P}.$$

The following result is a reformulation of [11, Lemma 2].

LEMMA 3.1. *Let λ be a one dimensional K -representation of $\mathfrak{P}\mathfrak{G}$ and let $1 \leq s \leq p$. Then there exists an indecomposable $K\mathfrak{P}\mathfrak{G}$ -module V_s^λ such that $\dim_K V_s^\lambda = s$, V_{s+1}^λ is indecomposable and if U is the unique submodule of V_s^λ with $\dim_K U$*

$= 1$ then $uG = \lambda(G)u$ for all $u \in U$, $G \in \mathfrak{G}\mathfrak{P}$. Furthermore every nonzero indecomposable $K\mathfrak{P}\mathfrak{G}$ -module is isomorphic to some V_s^λ ; $V_s^\lambda \approx V_t^\mu$ if and only if $s = t$, $\lambda = \mu$; V_s^λ is projective if and only if $s = p$.

Throughout this section V_s^λ will be defined as in Lemma 3.1 and for any λ , $V_0^\lambda = 0$. In case $\mathfrak{G} = \langle 1 \rangle$ we will write $V_s = V_s^\lambda$. If $E \in \mathfrak{G}$ then $\det_s^\lambda(E)$ denotes the determinant of E acting as a linear transformation on V_s^λ and φ_s^λ denotes the Brauer character of $\mathfrak{P}\mathfrak{G}$ corresponding to V_s^λ .

LEMMA 3.2. *Let $0 \leq i \leq s \leq p$. Then V_s^λ has a unique submodule U_i with $\dim_K U_i = i$. Furthermore $U_i \approx V_i^\lambda$ and $V_s^\lambda/U_i \approx V_{s-i}^{\lambda\alpha^{-i}}$.*

Proof. Since every irreducible $K\mathfrak{P}\mathfrak{G}$ -module is 1-dimensional V_s^λ has an i -dimensional submodule U_i for $0 \leq i \leq s$. As $V_{s|\mathfrak{P}}^\lambda$ is indecomposable each U_i is uniquely determined. By Lemma 3.1. $U_i \subseteq U_i$ and so $U_i \approx V_i^\lambda$.

If $i = 0$ or $i = s$ the last statement is clear. Suppose that $i = 1$ and $s \geq 2$. Since $|\mathfrak{G}| \mid (p-1)$ the $K\mathfrak{G}$ -module $U_2|\mathfrak{G}$ is a direct sum of two $K\mathfrak{G}$ -modules. Choose a K -basis x, y of U_2 such that $y \in U_1$ and $xE = \mu(E)x$ for all $E \in \mathfrak{G}$ and some 1-dimensional K -representation of \mathfrak{G} . Then for suitable $P \in \mathfrak{P}$, $xP = x + y$. Thus for $E \in \mathfrak{G}$

$$\begin{aligned} x + \alpha(E)y &= xP^{\alpha(E)} = xE^{-1}PE = \mu(E^{-1})xPE = \mu(E^{-1})xE + \mu(E^{-1})yE \\ &= x + \mu(E^{-1})\lambda(E)y. \end{aligned}$$

Hence $\mu(E) = \lambda(E)\alpha^{-1}(E)$ for all $E \in \mathfrak{G}$. If \bar{x} denotes the image of x in V_s^λ/U_1 this implies that if $G = PE$, $P \in \mathfrak{P}$, $E \in \mathfrak{G}$ then

$$\bar{x}G = \bar{x}E = \lambda\alpha^{-1}(E)\bar{x} = \lambda\alpha^{-1}(G)\bar{x}$$

Thus $V_s^\lambda/U_i \approx V_{s-i}^{\lambda\alpha^{-i}}$. Since $V_s^\lambda/U_1 \approx (V_s^\lambda/U_1)/(U_1/U_1)$ for $i \geq 1$ the result follows by induction on i .

LEMMA 3.3. $(V_s^\lambda)^* \approx V_s^{\lambda^{-1}\alpha^{(s-1)}}$. $\det_s^\lambda(E) = \lambda^s \alpha^{-s(s-1)/2}(E)$ for $E \in \mathfrak{G}$. Let $\mathfrak{G} = \langle E_0 \rangle$. Then $\varphi_s^{\alpha^j}(E_0) = \epsilon^j \left(\sum_{i=0}^{s-1} \epsilon^{-i} \right)$ for a suitable primitive $|\mathfrak{G}|$ th root of unity ϵ and all s and j .

Proof. This is an immediate consequence of Lemma 3.2.

LEMMA 3.4. $V_s^\lambda \otimes V_p^\mu \approx \sum_{i=0}^{s-1} V_p^{\lambda\mu\alpha^{-i}}$ for $0 \leq s \leq p$.

Proof. Let M_μ be the 1-dimensional $K\mathbb{C}$ -module corresponding to the representation $\mu|\mathbb{C}$. It is easily seen (and well known) that $V_p^\mu \approx M_\mu^{\mathbb{C}\mathfrak{P}}$. By Lemma

3.2 $V_s^\lambda|\mathbb{C} \approx \sum_{i=0}^{s-1} M_{\lambda\alpha^{-i}}$. Thus [3, p. 325].

$$V_s^\lambda \otimes V_p^\mu \approx (V_s^\lambda|\mathbb{C} \otimes M_\mu)^{\mathbb{C}\mathfrak{P}} \approx \left(\sum_{i=0}^{s-1} M_{\lambda\mu\alpha^{-i}} \right)^{\mathbb{C}\mathfrak{P}} \approx \sum_{i=0}^{s-1} V_p^{\lambda\mu\alpha^{-i}}$$

LEMMA 3.5. *If $0 \leq s \leq t$ and $s + t \leq p$ then*

$$V_s^\lambda \otimes V_t^\mu \approx \sum_{i=0}^{s-1} V_{s+t-1-2i}^{\lambda\mu\alpha^{-i}}$$

Proof. It suffices to prove the result in case $|\mathbb{C}| = p - 1$. If $s = 0$ or 1 it is immediate.

Suppose $s = 2$. By [6, Theorem 3 (2.3 b)] $V_2 \otimes V_t \approx V_{t-1} + V_{t+1}$. Thus by Lemma 3.1 $V_2^\lambda \otimes V_t^\mu \approx V_{t-1}^\beta + V_{t+1}^\gamma$ for some β, γ . By Lemma 3.2 there exist K -bases $\{x_0, x_1\}$ of V_2^λ and $\{y_0, \dots, y_{t-1}\}$ of V_t^μ such that for $E \in \mathbb{C}$ and all i

$$x_i E = \lambda \alpha^{-i}(E) x_i, \quad y_i E = \mu \alpha^{-i}(E) y_i.$$

Furthermore if U is the submodule of $V_2^\lambda \otimes V_t^\mu$ consisting of all u with $uP = u$ for all $P \in \mathfrak{P}$ then $\dim_K U = 2$. Let $P \in \mathfrak{P}$. Then there exist $a, b \in K$ with $ab \neq 0$ such that

$$\begin{aligned} x_0 P &= x_0, & x_1 P &= x_1 + a x_0 \\ y_0 P &= y_0, & y_1 P &= y_1 + b y_0 \end{aligned}$$

Define

$$v_0 = x_0 \otimes y_0, \quad v_1 = \frac{1}{a} x_1 \otimes y_0 - \frac{1}{b} x_0 \otimes y_1.$$

Then $v_i P = v_i$ for $i = 0, 1$, and so $\{v_0, v_1\}$ is a basis of U . If $E \in \mathbb{C}$ then

$$v_0 E = \lambda \mu(E) v_0, \quad v_1 E = \lambda \mu \alpha^{-1}(E) v_1$$

As $|\mathbb{C}| \neq 1$, $\lambda \mu \neq \lambda \mu \alpha^{-1}$. Therefore $v_0 \in V_{t-1}^\beta$ and $\beta = \lambda \mu$ or $v_0 \in V_{t+1}^\gamma$ and $\gamma = \lambda \mu$.

Let $\langle x_0 \rangle \approx V_1^\lambda$ be the submodule of V_2^λ generated by x_0 . Let $W = \langle x_0 \rangle \otimes V_t^\mu \approx V_t^{\mu\lambda}$. Thus W is indecomposable and $v_0 \in W$. Since $\dim_K W = t$ it follows that $W \cap U_{t+1} \neq 0$, where U_{t+1} is a submodule of $V_2^\lambda \otimes V_t^\mu$ with $U_{t+1} \approx V_{t+1}^\gamma$. By Lemma 3.2 $v_0 \in W \cap U_{t+1}$. Hence $v_0 \in U \cap U_{t+1}$ and $\gamma = \lambda \mu$. Thus $\beta = \lambda \mu \alpha^{-1}$ and the result is proved in case $s = 2$.

We proceed by induction on s . Assume that $s \geq 3$ and the result has been proved for $s - 1$ and $s - 2$. Then

$$V_{s-1}^\lambda \otimes V_2^\nu \otimes V_t^\mu \approx (V_{s-2}^{\lambda\alpha^{-1}} \otimes V_t^\mu) + (V_s^\lambda \otimes V_t^\mu).$$

Thus by induction

$$\sum_{i=0}^{s-2} (V_{s+t-2-2i}^{\lambda\mu\alpha^{-i}} \otimes V_2^\nu) \approx \sum_{i=0}^{s-3} V_{s+t-3-2i}^{\lambda\mu\alpha^{-i-1}} + (V_s^\lambda \otimes V_t^\mu).$$

Applying the first part of the lemma once again yields that

$$V_{s+t-1}^{\lambda\mu} + 2 \left(\sum_{i=1}^{s-2} V_{s+t-1-2i}^{\lambda\mu\alpha^{-i}} \right) + V_{t-s+1}^{\lambda\mu\alpha^{-(s-1)}} \approx \sum_{i=0}^{s-3} V_{s+t-3-2i}^{\lambda\mu\alpha^{-i-1}} + (V_s^\lambda \otimes V_t^\mu).$$

The result now follows from the Krull-Schmidt Theorem.

The next result is proved in a similar manner to [6, (2.5 a)].

LEMMA 3.6. *Suppose that $1 \leq b, c \leq p-1$ and $V_b^\beta \otimes V_c^\gamma \approx \sum_{i=0}^k V_{e_i}^{\alpha^i}$ with $e_i > 0$ for $i = 0, \dots, k$. Then*

$$\sum_{i=0}^k V_p^{\gamma_i \alpha^{b-e_i}} + (V_{p-b}^\beta \otimes V_c^\gamma) \approx \sum_{j=0}^{c-1} V_p^{\beta^\gamma \alpha^{-j}} + \sum_{i=0}^k V_{p-e_i}^{\gamma_i \alpha^{b-e_i}}.$$

Proof. By Lemma 3.2

$$0 \rightarrow V_{p-b}^{\beta \alpha^{p-b}} \rightarrow V_p^{\beta \alpha^{p-b}} \rightarrow V_b^\beta \rightarrow 0.$$

is exact. Tensoring with V_c^γ yields that

$$0 \rightarrow V_{p-b}^{\beta \alpha^{p-b}} \otimes V_c^\gamma \rightarrow V_p^{\beta \alpha^{p-b}} \otimes V_c^\gamma \rightarrow V_b^\beta \otimes V_c^\gamma \rightarrow 0$$

is exact. Also

$$0 \rightarrow \sum_{i=0}^k V_{p-e_i}^{\gamma_i \alpha^{p-e_i}} \rightarrow \sum_{i=0}^k V_p^{\gamma_i \alpha^{p-e_i}} \rightarrow \sum_{i=0}^k V_{e_i}^{\gamma_i} \rightarrow 0$$

is exact. Thus Schanuel's Theorem and Lemma 3.4 imply that

$$\sum_{i=0}^k V_p^{\gamma_i \alpha^{p-e_i}} + (V_{p-b}^{\beta \alpha^{p-b}} \otimes V_c^\gamma) \approx \sum_{j=0}^{c-1} V_p^{\beta^\gamma \alpha^{p-b-j}} + \sum_{i=0}^k V_{p-e_i}^{\gamma_i \alpha^{p-e_i}}.$$

The result follows by tensoring this equation with $V_1^{\alpha^{b-p}}$

LEMMA 3.7. *If $1 \leq s \leq \frac{p-1}{2}$ then*

$$V_s^\lambda \otimes V_s^\mu \approx \sum_{i=0}^{s-1} V_{2i+1}^{\lambda\mu\alpha^{i+1-s}}$$

$$V_{p-s}^\lambda \otimes V_{p-s}^\mu \approx \sum_{i=0}^{s-1} V_{2i+1}^{\lambda\mu\alpha^{s+i}} + \sum_{i=2s}^{p-1} V_p^{\lambda\mu\alpha^i}$$

Proof. The first statement is a special case of Lemma 3.5. Also Lemma 3.5 yields that

$$V_s^\lambda \otimes V_{p-s}^\mu \approx \sum_{i=0}^{s-1} V_{p-1-2i}^{\lambda\mu\alpha^{-i}}$$

Apply Lemma 3.6 with $\beta = \lambda$, $\gamma = \mu$, $b = s$ and $c = p - s$. Then

$$\sum_{i=0}^{s-1} V_p^{\lambda\mu\alpha^{s+i-p+1}} + (V_{p-s}^\lambda \otimes V_{p-s}^\mu) \approx \sum_{j=0}^{p-s-1} V_p^{\lambda\mu\alpha^{-j}} + \sum_{i=0}^{s-1} V_{2i+1}^{\lambda\mu\alpha^{s+i-p+1}}$$

Since $\alpha^{p-1}(G) = 1$ for all $G \in \mathfrak{G}\mathfrak{F}$ the Krull Schmidt Theorem implies the result.

LEMMA 3.8. *If $1 \leq s \leq \frac{p-1}{2}$ then*

$$V_s^\lambda \otimes (V_s^\lambda)^* \approx \sum_{i=0}^{s-1} V_{2i+1}^{\alpha^i}$$

$$V_{p-s}^\lambda \otimes (V_{p-s}^\lambda)^* \approx \sum_{i=0}^{s-1} V_{2i+1}^{\alpha^i} + \sum_{i=s}^{p-s-1} V_p^{\alpha^i}$$

Proof. This follows directly from Lemmas 3.3 and 3.7 and the fact that $\alpha^{p-1}(G) = 1$ for all $G \in \mathfrak{G}\mathfrak{F}$.

§ 4. Proof of Theorem 1

Throughout this section \mathfrak{G} is a group which satisfies the hypotheses of Theorem 1. \mathfrak{F} is a S_p -subgroup of \mathfrak{G} . Since $d \leq p$ in Theorem 1 \mathfrak{F} has exponent p and so $|\mathfrak{F}| = p$ as \mathfrak{F} is cyclic. $\mathfrak{N} = N_{\mathfrak{G}}(\mathfrak{F})$ and $\mathfrak{C} = C_{\mathfrak{G}}(\mathfrak{F}) = \mathfrak{F} \times \mathfrak{H}$. By assumption $\mathfrak{N} \cong \mathfrak{G}$ and by Burnside's transfer theorem $\mathfrak{N} \cong \mathfrak{C}$. K is a field of characteristic p .

$\mathcal{M} = \{M \mid M \text{ is an indecomposable } K\mathfrak{G}\text{-module with } \dim_K M \leq p \text{ and } \mathfrak{F} \text{ is not in the kernel of } M\}$.

By assumption \mathcal{M} is nonempty. If $M \in \mathcal{M}$ then M is a direct summand of $(M|_{\mathfrak{N}})^{\mathfrak{G}}$ by D. G. Higman's Theorem [3, § 63]. Thus $M|_{\mathfrak{N}}$ is indecomposable by the Mackey decomposition and if $\dim_K M < p$ then M is uniquely determined by $M|_{\mathfrak{N}}$. The Mackey decomposition and (2.1) imply that $M|_{\mathfrak{C}} = \sum_{i=1}^u U_i \otimes W_i$ where for each i U_i is an indecomposable $K\mathfrak{F}$ -module and W_i is an irreducible $K\mathfrak{H}$ -module. Furthermore $U_i \otimes W_i$ is conjugate to $U_j \otimes W_j$ for all i, j under the action of $\mathfrak{N}/\mathfrak{C}$. Thus $\dim_K U_i = c$, $\dim_K W_i = b$ are both independent of i and in the notation of section 3 $U_i \approx V_c$ for all i . Therefore

$$(4.1) \quad M|_{\mathbb{G}} \approx V_c \otimes \left(\sum_{i=1}^a W_i \right), \dim_K W_i = b.$$

The triple $a = a(M)$, $b = b(M)$, $c = c(M)$ is a set of invariants attached to M and (4.1) implies that

$$(4.2) \quad \dim_K M = a(M)b(M)c(M).$$

LEMMA 4.1. *Suppose that $p \geq 5$. If $M \in \mathcal{M}$ then $\dim_K M > 2$.*

Proof. Suppose $\dim_K M \leq 2$ for some $M \in \mathcal{M}$. Let \mathfrak{K} be the kernel of M . Then \mathbb{G}/\mathfrak{K} is isomorphic to a subgroup of $GL_2(K)$. All finite subgroups of $GL_2(K)$ are known and it is easily seen that \mathbb{G}/\mathfrak{K} and hence \mathbb{G} , is of type $L_2(p)$ contrary to assumption.

LEMMA 4.2. *Suppose that $p \geq 5$. If $M \in \mathcal{M}$ with \mathfrak{H} in the kernel of M then $\dim_K M > 3$.*

Proof. Let $M \in \mathcal{M}$ with \mathfrak{H} in the kernel of M . Suppose that $\dim_K M \leq 3$. By Lemma 4.1 it may be assumed that $\dim_K M = 3$ and M is absolutely irreducible. We will reach a contradiction by showing that \mathbb{G} is of type $L_2(p)$. By changing notation it may be assumed that $\mathbb{G}' = \mathbb{G}$ and M is faithful. Thus $C_{\mathbb{G}}(\mathfrak{B}) = \mathfrak{B}$. Let $\mathfrak{N} = \mathfrak{B}\mathfrak{C}$ with $\mathfrak{B} \cap \mathfrak{C} = \langle 1 \rangle$. Let $\mathfrak{E} = \langle E \rangle$. Let α be defined as in (3.1). Then $M|_{\mathfrak{N}} \approx V_3^\lambda$ for some one dimensional K -representation λ by Lemma 3.1 and (4.1). Lemmas 3.1, 3.3 and 3.8 imply that $M \otimes M^* = L_0 + L_1 + L_2$ where $\dim_K L_i = 2i + 1$ and $L_i|_{\mathfrak{N}}^* = L_i|_{\mathfrak{N}}$. Thus M may be chosen so that $M|_{\mathfrak{N}}^* \approx M|_{\mathfrak{N}}$.

Since $C_{\mathbb{G}}(\mathfrak{B}) = \mathfrak{B}$ there is only one block of defect 1 [3, (86.10)]. Hence M is in the principal block of \mathbb{G} . Thus if K_0 is the field of p elements there exists a K_0 -representation \mathfrak{F} of \mathbb{G} corresponding to M by (2.4). Since $M|_{\mathfrak{N}} \approx M|_{\mathfrak{N}}^*$ it follows from Lemma 3.3 that \mathfrak{F} is equivalent to \mathfrak{F}^* . An argument of R. Brauer [2, p. 438] now implies that \mathbb{G} is isomorphic to a subgroup of $O_3(p)$. Since $O_3(p)$ is of type $L_2(p)$ so is \mathbb{G} contrary to assumption.

LEMMA 4.3. *Suppose that $p \geq 5$. If $M \in \mathcal{M}$ then $c(M) > \frac{p-1}{2}$.*

Proof. Suppose $M \in \mathcal{M}$ with $c = c(M) \leq \frac{p-1}{2}$. By Lemma 3.8 and (4.1)

$$M \otimes M^*|_{\mathbb{G}} \approx \left(\sum_{i=0}^{c-1} V_{2i+1} \right) \otimes \left(\sum_{j=1}^a \sum_{k=1}^a W_i \otimes W_j^* \right).$$

Thus no direct summand of $M \otimes M^*|_{\mathbb{G}}$ is projective. Let W_0 be the trivial 1-dimensional $K\mathbb{G}$ -module. Then

$$M \otimes M^*|_{\mathbb{G}} \approx \sum_{i=0}^{c-1} (V_{2i+1} \otimes W_0) + U$$

where U is a direct sum of indecomposable modules none of which are projective. Since $M \in \mathcal{M}$, $c > 1$. Thus $V_3 \otimes W_0$ is isomorphic to a direct summand of $M \otimes M^*|_{\mathbb{G}}$. Let L be a direct summand of $M \otimes M^*$ such that $V_3 \otimes W_0$ is isomorphic to a direct summand of $L|_{\mathbb{G}}$. Since no direct summand of $L|_{\mathfrak{B}}$ is projective, $L|_{\mathfrak{B}}$ is indecomposable. As \mathfrak{H} is in the kernel of $V_3 \otimes W_0$ \mathfrak{H} is also in the kernel of $L|_{\mathfrak{B}}$. Thus $L|_{\mathbb{G}}$ is indecomposable by Lemma 3.1. Hence $\dim_K L = 3$ contrary to Lemma 4.2.

LEMMA 4.4. *If $M \in \mathcal{M}$, $M|_{\mathfrak{B}}$ is indecomposable and $\mathfrak{H} = \mathbf{Z}(\mathbb{G})$.*

Proof. If $\dim_K M = p$ then M is projective and so $M|_{\mathfrak{B}}$ is projective and hence indecomposable. Suppose that $\dim_K M \leq p - 1$. If $p = 3$ then $M|_{\mathfrak{B}}$ is indecomposable since \mathfrak{B} is not in the kernel of M . If $p \geq 5$ then (4.2) and Lemma 4.3 imply that $a(M) = b(M) = 1$. Thus by (4.1) $M|_{\mathfrak{B}}$ is indecomposable in any case. If \mathfrak{F} is the K -representation of \mathbb{G} corresponding to M this implies that any p' -element in the commuting ring of $\mathfrak{F}|_{\mathfrak{B}}$ is a scalar. Thus $\mathfrak{H} = \mathbf{Z}(\mathbb{G})$ as required.

The proof of Theorem 1 can now be given. If $p = 2$ then \mathbb{G} is 2-solvable since $|\mathfrak{B}| = 2$ contrary to assumption. Thus $p \neq 2$. In view of Lemma 4.4 it only remains to prove the inequalities. If $p = 3$ the result is trivial and if $p = 5$ it follows from Lemma 4.1. Hence it may be assumed that $p \geq 7$. It may further be assumed that $\mathbb{G} = \mathbb{G}'$ and K is algebraically closed without loss of generality.

Choose $L \in \mathcal{M}$ with $\dim_K L$ minimal. Let $d = p - s = \dim_K L$. It may be assumed that L is faithful. By Lemma 4.3 and (4.1)

$$(4.3) \quad L|_{\mathbb{G}} \approx V_{p-s} \otimes W, \dim_K W = 1, s \leq \frac{p-1}{2}.$$

Since \mathfrak{N}/\mathbb{G} is cyclic and $\mathfrak{H} \subseteq \mathbf{Z}(\mathfrak{N})$ it follows that $\mathfrak{N}/\mathfrak{B}$ is abelian. Thus there exists a $K\mathfrak{N}$ -module W_1 whose kernel contains \mathfrak{B} such that $W_1|_{\mathfrak{H}} = W$. Then

$$(4.4) \quad L|_{\mathfrak{N}} \otimes L^*|_{\mathfrak{N}} \approx (L|_{\mathfrak{N}} \otimes W_1^*) \otimes (L|_{\mathfrak{N}} \otimes W_1^*)^*.$$

Furthermore

$$(L|_{\mathfrak{N}} \otimes W_1^*)|_{\mathfrak{G}} \approx V_{p-s} \otimes W_0$$

where W_0 denotes the trivial 1-dimensional $K\mathfrak{G}$ -module. Let $\bar{\mathfrak{N}} = \mathfrak{N}/\mathfrak{G}$. Thus $L|_{\mathfrak{N}} \otimes W_1^*$ is a $K\bar{\mathfrak{N}}$ -module. Hence (4.3), (4.4) and Lemma 3.8 imply that in the notation of section 3

$$(4.5) \quad L|_{\mathfrak{N}} \otimes L^*|_{\mathfrak{N}} \approx \sum_{i=0}^{s-1} V_{2i+1}^{\alpha^i} + \sum_{i=s}^{p-s-1} V_p^{\alpha^i},$$

where each V_j^λ is a $K\bar{\mathfrak{N}}$ -module.

Higman's Theorem and (4.5) imply that

$$L \otimes L^* \approx \sum_{i=0}^{s-1} L_i + A$$

where each L_i is indecomposable, A is projective and $L_i|_{\mathfrak{N}}$ has $V_{2i+1}^{\alpha^i}$ as a direct summand. Let

$$(4.6) \quad L_i|_{\mathfrak{N}} = V_{2i+1}^{\alpha^i} + \sum_{j=1}^{m_i} V_p^{\mu_{ij}}$$

Thus L_0 is the 1-dimensional trivial $K\mathfrak{G}$ -module. By (4.5)

$$(4.7) \quad \{\mu_{ij} | j = 1, \dots, m_i; i = 0, \dots, s-1\} \subseteq \{\alpha^i | s \leq i \leq p-s-1\}$$

Suppose that $p-s < 2/3(p-1)$. Then $p < 3s-1$. By (4.7)

$$\sum_{i=1}^{s-1} m_i \leq (p-s-1) - s + 1 = p-2s < s-1.$$

Hence at least $(s-1) - (p-2s)$ of the m_i are zero. Thus $m_k = 0$ for some k with

$$1 \leq k \leq (s-1) - \{(s-1) - (p-2s)\} = p-2s.$$

Thus by (4.6)

$$\dim_k L_k = 2k + 1 \leq 2p - 4s + 1 = (p-s) + (p+1-3s) < p-s = d.$$

Hence $L_k \in \mathcal{M}$ contrary to the minimality of d . Therefore in proving Theorem 1 it may be assumed that $p \geq 13$ and $d = p-s \geq 2/3(p-1)$ or equivalently

$$(4.8) \quad s \leq \frac{p+2}{3}, \quad p \geq 13.$$

Choose $E \in \mathfrak{G}$ so that $\mathfrak{N} = \langle E, \mathfrak{G} \rangle$. Since $\mathfrak{G} = \mathfrak{G}' E$ must have determinant 1 when considered as a linear transformation on the K -space L_i for $i = 0, \dots, s-1$. Thus by (4.6) and Lemma 3.3.

$$(4.9) \quad \left(\prod_{j=1}^{m_i} \mu_{ij} \right) \alpha^{m_i(p-1)/2}(E) = \left(\prod_{j=1}^{m_i} \mu_{ij}^p \right) \alpha^{-m_i p(p-1)/2}(E) = 1.$$

Hence if $m_i = 1$ then $\mu_{i1}(E) = \alpha^{(p-1)/2}(E) = \pm 1$. Since \mathfrak{G} is not of type $L_2(p)$, $E \neq 1$. Thus for any k either $\alpha^k(E) \neq \alpha^{(p-1)/2}(E)$ or $\alpha^{k+1}(E) \neq \alpha^{(p-1)/2}(E)$. Consequently (4.5) and (4.6) imply that at most $\frac{p+1-2s}{2}$ of m_i 's are equal to 1.

Suppose first that $2s-1 < p-s = d$. The minimality of d and (4.6) yield that $m_i \neq 0$ for $i = 1, \dots, s-1$. Thus by (4.6)

$$s-1 \leq \frac{p+1-2s}{2} + \frac{1}{2} \left\{ p-2s - \frac{(p+1-2s)}{2} \right\} = \frac{1}{4} (3p-6s+1).$$

Hence $s \leq \frac{3p+5}{10}$ and so $d = p-s \geq \frac{7p}{10} - \frac{1}{2}$ as required.

Assume now that $2s-1 \geq p-s$. Thus $s \geq 5$. The minimality of d yields that $m_i \neq 0$ for $i = 1, \dots, s-2$.

Thus by (4.6)

$$s-2 \leq \frac{p+1-2s}{2} + \frac{1}{2} \{ p-2s - (p+1-2s) \} = \frac{1}{4} (3p-6s+1)$$

Therefore

$$10s \leq 3p+9 = 9s+6$$

Hence $s \leq 6$ and $p \neq 13$ so $p \leq 3s-1 \leq 17$. Thus $s = 6$ and $p = 17$. Furthermore $\dim_K L_5 = 11 = d$. Since \mathfrak{H} is in the kernel of L_5 it may be assumed L was chosen initially such that \mathfrak{H} is in the kernel of L . Hence since L is faithful it may be assumed that $\mathfrak{H} = \langle 1 \rangle$. Thus L is in the principal p -block. The minimality of d implies that L is an irreducible $K\mathfrak{G}$ -module. Therefore $|\langle E \rangle| = |\mathfrak{N} : \mathfrak{H}| > 2$ by (2.3). Thus for any k either $\alpha^k(E) \neq \alpha^{(p-1)/2}(E)$ or $\alpha^{k+1}(E) \neq \alpha^{(p-1)/2}(E)$ or $\alpha^{k+2}(E) \neq \alpha^{(p-1)/2}(E)$. Thus by (4.9) at most $\frac{p+2-2s}{3} < 3$ of the m_i 's are equal to 1 and so by (4.6).

$$4 = s-2 \leq 2 + \frac{1}{2} (5-2) < 4.$$

This contradiction establishes Theorem 1 in all cases,

§ 5. Proof of Theorem 2

Throughout this section \mathfrak{G} is a group which satisfies the hypotheses but not the conclusion of Theorem 2. \mathfrak{P} is a S_p -subgroup of \mathfrak{G} and $\mathfrak{N} = \mathbf{N}_{\mathfrak{G}}(\mathfrak{P})$. ζ is an irreducible faithful complex character of degree d .

LEMMA 5.1. \mathfrak{G} is simple. $|\mathfrak{P}| = p$ and $\mathbf{C}_{\mathfrak{G}}(\mathfrak{P}) = \mathfrak{P}$

Proof. Let \mathfrak{G}_0 be the subgroup of \mathfrak{G} generated by all p -elements in \mathfrak{G} . Thus $\mathfrak{G}_0 \triangleleft \mathfrak{G}$. Let $\zeta|_{\mathfrak{G}_0} = \sum_{i=1}^n \omega_i$ where each ω_i is an irreducible character of \mathfrak{G}_0 . Since the ω_i are conjugate under the action of \mathfrak{G} they all have the same degree. Thus if $n > 1$, $\omega_i(1) < \frac{p-1}{2}$ for each i and so by [5] $\mathfrak{P} \triangleleft \mathfrak{G}$ contrary to assumption. Hence $\zeta|_{\mathfrak{G}_0} = \omega$ is irreducible. Thus $\mathbf{Z}(\mathfrak{G}_0) = \mathbf{Z}(\mathfrak{G}) = \langle 1 \rangle$.

Suppose that $|\mathfrak{P}| \neq p$. Then there exists $\mathfrak{P}_1 \triangleleft \mathfrak{G}$ with $|\mathfrak{P} : \mathfrak{P}_1| = p$ [4]. Hence $\mathfrak{P} \subseteq \mathbf{C}_{\mathfrak{G}}(\mathfrak{P}_1) \triangleleft \mathfrak{G}$ and so $\mathfrak{G}_0 \subseteq \mathbf{C}_{\mathfrak{G}}(\mathfrak{P}_1)$. Thus $\mathfrak{P}_1 \subseteq \mathbf{Z}(\mathfrak{G}_0) = \langle 1 \rangle$ and so $|\mathfrak{P}| = p$.

Suppose that $\mathfrak{N} \triangleleft \mathfrak{G}_0$, $\mathfrak{N} \neq \mathfrak{G}_0$. Then \mathfrak{N} is a p' -group. Hence $\mathfrak{N} \triangleleft \mathfrak{N}\mathfrak{P}$ and $\mathfrak{N}\mathfrak{P}$ is p -solvable. Since $\mathfrak{N}\mathfrak{P}$ has a faithful complex representation of degree $d < p-1$ it follows that $\mathfrak{N}\mathfrak{P}$ has a K -representation whose kernel is in \mathfrak{P} for a suitable field K of characteristic p . Thus by Theorem B of Hall and Higman [7] (see also [11] for a simplification of part of the proof.) $\mathfrak{P} \subseteq \mathbf{C}_{\mathfrak{G}_0}(\mathfrak{N}) \triangleleft \mathfrak{G}_0$. Thus $\mathfrak{N} \subseteq \mathbf{Z}(\mathfrak{G}_0) = \langle 1 \rangle$. Therefore \mathfrak{G}_0 is simple.

By (2.2)

$$e = |\mathfrak{N} : \mathbf{C}(\mathfrak{P})| = p - \zeta(1) = p - \omega(1) = |\mathbf{N}_{\mathfrak{G}_0}(\mathfrak{P}) : \mathbf{C}_{\mathfrak{G}_0}(\mathfrak{P})|.$$

Since $\mathfrak{G} = \mathfrak{G}_0\mathfrak{N}$ this yields that $\mathfrak{G} = \mathfrak{G}_0\mathbf{C}_{\mathfrak{G}}(\mathfrak{P})$. If \mathfrak{G} is not of type $L_2(p)$ then Theorem 1 implies that $\mathfrak{G} = \mathfrak{G}_0$ and $\mathfrak{P} = \mathbf{C}_{\mathfrak{G}}(\mathfrak{P})$ completing the proof of the Lemma. Suppose that \mathfrak{G} is of type $L_2(p)$. Thus $\mathfrak{G}_0 \approx PSL_2(p)$. Since $PSL_2(p)$ admits no outer automorphism which leaves all the elements in a S_p -subgroup fixed it follows that $\mathfrak{G} = \mathfrak{G}_0 \approx PSL_2(p)$. Thus \mathfrak{G} is simple since $p > 3$ and $\mathbf{C}_{\mathfrak{G}}(\mathfrak{P}) = \mathfrak{P}$ as required.

Let F be a finite extension field of the field of p -adic numbers which is a splitting field for \mathfrak{G} and all its subgroups and contains all the $|\mathfrak{G}|$ th roots of unity. Let R be the ring of local integers in F , let \mathfrak{p} be the maximal ideal in R and let $K = R/\mathfrak{p}$. It is well known that there exists an $R\mathfrak{G}$ -module Z which affords the character ζ . Let $\bar{Z} = Z/\mathfrak{p}Z$.

LEMMA 5.2. \bar{Z} is absolutely irreducible.

Proof. Since F contains all $|\mathfrak{G}|$ th roots of unity K is a splitting field of \mathfrak{G} . Thus it suffices to show that \bar{Z} is irreducible. By (2.2) and Lemma 5.1 every modular irreducible constituent of \bar{Z} is faithful. Hence if \bar{Z} is reducible then \mathfrak{G} has a faithful K -representation of degree at most $d/2 < \frac{p-1}{2}$. Hence by Theorem 1 \mathfrak{G} is of type $L_2(p)$ and so \mathfrak{G} is isomorphic to $PSL_2(p)$ by Lemma 5.1. In this case it is well known that $e = \frac{p-1}{2}$ and $p \equiv 1 \pmod{4}$ contrary to assumption.

Let $\mathfrak{N} = \mathfrak{B}\mathfrak{G}$ with $\mathfrak{B} \cap \mathfrak{G} = \langle 1 \rangle$ and let $\mathfrak{G} = \langle E \rangle$. Let α be defined as in (3.1). Let ε be a primitive e^{th} root of unity in R such that the image of ε in R/p is $\alpha(E)$.

LEMMA 5.3. $\bar{Z}|_{\mathfrak{N}} \not\approx V_{p-e}^1$

Proof. Suppose that $\bar{Z}|_{\mathfrak{N}} \approx V_{p-e}^1$. Let $\{\zeta_i | i = 1, \dots, \frac{p-1}{e}\}$ be all the irreducible complex characters of \mathfrak{G} which are algebraically conjugate to ζ . Then by (2.2) the ζ_i are all equal as Brauer characters. Thus if U is an $R\mathfrak{G}$ -module affording the character θ such that $\bar{U} = U/pU$ is the projective indecomposable $K\mathfrak{G}$ -module corresponding to \bar{Z} then $\theta = \sum_{i=1}^{p-1/e} \zeta_i + \theta$ for some character θ . Thus [11, Theorem 1] there exists an $R\mathfrak{G}$ -module M which affords the character $\sum_{i=1}^{p-1/e} \zeta_i$ such that $\bar{M} = M/pM$ is indecomposable. Since $\dim_K \bar{M} = \left(\frac{p-1}{e} - 1\right)p + 1$ Higman's theorem and Lemma 3.1 imply that

$$\bar{M}|_{\mathfrak{N}} \approx V_1^{\alpha^k} + \sum_{j=1}^{(p-1)/e-1} V_p^{\alpha^{a(j)}}$$

for suitable k and $a(j)$. Let ψ be the Brauer character afforded by \bar{M} . Then Lemma 3.3 implies that

$$\begin{aligned} \psi(E) &= \varepsilon^k + \sum_{j=1}^{(p-1)/e-1} \varepsilon^{a(j)} \left(\sum_{t=0}^{p-1} \varepsilon^{-t} \right) = \varepsilon^k + \sum_{j=1}^{(p-1)/e-1} \varepsilon^{a(j)} \\ \zeta_i(E) &= \sum_{t=0}^{p-e-1} \varepsilon^{-t} = 1 \end{aligned}$$

Since $\psi(E) = \sum_{i=1}^{(p-1)/e} \zeta_i(E)$ this yields that $k = 1$ and $a(j) = 1$ for all j . Hence $\bar{M}|_{\mathfrak{N}} \approx V_1^1 + A$ for some projective $K\mathfrak{N}$ -module A . Let L_0 be the trivial 1-dimensional $K\mathfrak{G}$ -module. Then $L_0|_{\mathfrak{N}} \approx V_1^1 + B$ for some projective $K\mathfrak{N}$ -module B . Hence by Higman's Theorem \bar{M} and L_0 are both direct summands of $(V_1^1)^{\mathfrak{G}}$ contrary to the Mackey decomposition. This contradiction establishes the lemma.

LEMMA 5.4. $e \equiv 0 \pmod{2}$, $\bar{Z}|_{\mathfrak{H}} \approx V_{p-1}^{\alpha^{e/2}}$ and $\frac{p-1}{e} \equiv 0 \pmod{2}$

Proof. Let $\bar{Z}|_{\mathfrak{H}} \approx V_{p-e}^{\alpha^k}$. By Lemma 3.3 $\zeta(E) = \varepsilon^k$. Since $\mathbf{C}_{\mathfrak{G}}(\mathfrak{H}) = \mathfrak{H}$ (2.2) implies that $\zeta(E)$ is rational. Hence $\varepsilon^k = \pm 1$. If $\varepsilon^k = 1$ then $e|k$ and so $\bar{Z}|_{\mathfrak{H}} \approx V_{p-e}^1$ contrary to Lemma 5.3. Hence $\varepsilon^k = -1$. Therefore $e \equiv 0 \pmod{2}$ and $\bar{Z}|_{\mathfrak{H}} \approx V_{p-e}^{\alpha^{e/2}}$.

Since \mathfrak{G} is simple $\det_{p-s}^{\alpha^{e/2}}(E) = 1$. Thus by Lemma 3.3

$$1 = \alpha^{e/2(p-e)} \alpha^{-(p-e)(p-e-1)/2}(E) = -\alpha^{-(p-e)(p-e-1)/2}(E) = -\alpha^{-(p-e-1)/2}(E).$$

Thus $\frac{p-e-1}{2} \equiv e/2 \pmod{e}$ and so $\frac{p-1}{2} \equiv 0 \pmod{e}$. Hence $\frac{p-1}{e} \equiv 0 \pmod{2}$ as required.

Theorem 2 now follows from Lemmas 5.1 and 5.4.
